PHARMACOPOEIA OF THE PEOPLE'S REPUBLIC OF CHINA

(2005)

Volume II

This pharmacopoeia is the English version edited from Pharmacopoeia of the People's Republic of China 2005. The Chinese edition is approved by the State Food and Drug Administration of the People's Republic of China to be effective from July 1, 2005, in accordance with the official document GSYJZ (2005) 234.

Preface

This edition of the Pharmacopoeia of the People's Republic of China (known as *the Chinese Pharmacopoeia 2005* or in abbreviation as Ch. P 2005) has been prepared in accordance with the principles and designed plan decided by the Eighth Chinese Pharmacopoeia Commission and accomplished with the effort made by Commission members and its Secretariat over more than two years. *The Chinese Pharmacopoeia 2005* adopted by the Executive Commission of the Chinese Pharmacopoeia Commission is approved for implementation by the State Food and Drug Administration of China. This is the eighth edition of Chinese Pharmacopoeia since the founding of the People's Republic of China.

The Chinese Pharmacopoeia 2005 has been considerably revised and improved in General Notices, Requirements of Monographs, General Requirements for Preparations in Appendices and new testing methods, etc. Based on the introduction of advanced technology and experimental methods widely adopted in China and abroad, the contents of Appendices are revised by and large in consistence with those nowadays applied internationally for drug quality control. On the premise that every effort should be made to follow the principle of "safety for use, reliability of therapeutic effect, feasibility of processes, controllability of manufacturing quality and perfection of specification", the monographs admitted in the Pharmacopoeia on the whole reflect the actual clinical use of drugs in China. Furthermore, stylistic rules and layout, wording, units, and symbols, etc. have also been standardized.

The Chinese Pharmacopoeia 2005 is published in three volumes. Volume I contains monographs of Chinese materia medica and prepared slice, vegetable oil/fat and its extract, Chinese traditional patent medicines, single ingredient of Chinese crude drug preparations etc.; Volume II deals with monographs of chemical drugs, antibiotics, biochemical preparations, radiopharmaceuticals and excipients for pharmaceutical use; Volume III contains biological products. *The Requirements for Biologics of the People's Republic of China* is now incorporated into the Chinese Pharmacopoeia for the first time. Based on the characteristics and the needs of improvement of Chinese traditional medicines, chemical drugs and biological products, the research work and the studies are carried out in an active way on drug standards and methodology. At the same time, great efforts are made to unify the national drug standards and to bring them in line with the international standards progressively. In addition, emphasis have been put to harmonization in Appendices of different volumes of Pharmacopoeia, to a sound connection between individual monographs and the relevant appendices, and to the standardization of text wording so as to make this edition more precise and better structured.

The increase of the number of monographs in *the Chinese Pharmacopoeia 2005* is obvious which contains up to 3214 monographs of drugs, with 525 new admissions in total. Volume I contains 1146 monographs, with 154 new admissions and 453 revised; Volume II deals with 1967 monographs, with 327 new admissions and 522 revised; Volume III contains 101 monographs, with 44 new admissions and 57 revised. 9 monographs adopted in *the Chinese Pharmacopoeia 2000* are not admitted in this edition and

123 monographs adopted in *the Requirements for Biologics of the People's Republic of China 2000* and in its *Supplement 2000* are not admitted in this edition.

The number of monographs in Appendices of this edition is much expanded. There are 98 monographs admitted in Appendices of Volume I with 12 new admissions, 31 revised and 1 deleted. There are 137 monographs in Appendices of Volume II with 13 new admissions, 65 revised and 1 deleted. There are 140 monographs in Appendices of Volume III with 62 new admissions, 78 revised and 1 deleted. The monographs in Appendices common to all the three volumes are presented in each volume respectively in a harmonized and unified form.

Extensive applications of contemporary techniques of analysis are shown in this edition. In Volume I, the number of monographs adopting thin layer chromatography in the test for identification reaches 1523 and 45 monographs for content determination; the number of monographs adopting high performance liquid chromatography (HPLC) reaches 479 and 518 items are involved; and the number of monographs adopting gas chromatography in the tests for identification and content reaches 47. In Volume II, the number of monographs, including testing items, adopting HPLC reaches 848 with an increase of 566 in comparison with that in 2000 edition, and this method is mostly used for the analysis of complex formulation and those drugs containing much more interfering factors such as impurities or excipients, and used for content determination in 223 newly admitted monographs. The number of monographs required for identification by infrared analysis reaches 70; the tests for dissolution and test of content uniformity are added in test items in 93 and 37 monographs, respectively, and the test for related substances is added in 226 monographs, and the requirements for systematic suitability testing are more reasonable. Based on the validation of methodology, the test for bacterial endotoxins instead of pyrogen test in rabbits is introduced to 73 monographs; on the premise that the drug purity is ensured, the test for undue toxicity for 42 monographs is deleted.

Significant revisions and expansion are made in the Appendices of this edition leading a great improvement in the monographs of Appendices. In order to adapt the need of drug administration, new preparations such as implants, rinsing agents, enemas, paint, and smeared films, etc. are admitted in the General Requirement for Preparations. Many subtypes of dosage form are also admitted in General Requirement for Preparations, such as soluble tablets and vaginal effervescent tablets admitted into General Requirement for tablets; sustained release capsules and controlled release capsules admitted into General Requirement for capsules, etc. Test for sterility is added in test items in some of preparations of General Requirement for Preparations. New general testing methods have been admitted, such as Determination of Total Organic Carbon in the Water for Pharmaceutical Use, Test for Visible Particles in Injections, Mass Spectrometry, Determination of Cataplasms Adhesion, Test for Allergen, Biological Assay of Calcitonin and Growth Hormone, etc. Furthermore, considerable revisions are made for a number of Appendices according to modern techniques and practical situation, for example, the tests on 12 pesticides containing organic phosphorous and 3 pesticides containing pyrethroid are added for determination of pesticide residues; the test for small volume of injection is included in the Test for Particulate Matter in Injections; the test for system suitability is admitted for Thin-layer Chromatography; Microbial Limit Tests is revised according to the requirements of drug administration route and tests for validation are added; the time of incubation in sterility test has been changed from 7 to 14 days.

In the section of guidelines, such guidelines have been revised to keep pace with the development of

research and production of drugs as the Guidelines the Stability Testing of Drug Substances and Preparations and the Guidelines for Sustained, Controlled and Delayed Release Preparations, and new guidelines are admitted such as the Guidelines for Hygroscopicity and Guidelines for Near-infrared (NIR) Spectrophotometry, etc. Although those guidelines do not serve as legal requirements, they play an important role in assessment of drug quality, in establishing, standardizing and implementing uniform pharmaceutical specification of drugs and medicines.

The safety of pharmaceuticals is another important issue of *the Chinese Pharmacopoeia 2005*. In Appendices of Volume I, for example, atomic absorption spectrophotometry or inductively coupled plasma mass spectrometry is introduced to determine 6 kinds of heavy metals and deleterious elements, and the limits for lead, cadmium, mercury, arsenic and copper are stipulated for the first time; the harmful solvents, such as benzene etc. used in pharmaceuticals should be substituted by other solvents as far as possible. The Guidelines for Application of Safety Tests for Injection of Traditional Chinese Medicine is also admitted in this edition; In Volume II, the Test for Particulate Matter in Injections is applied to 126 Injections intended for intravenous injection; the number of monographs adopting the Test for Bacterial Endotoxin reaches 112; the Determination of Residual Solvent includes the requirements of the International Conference on Harmonization (ICH) for residual solvents, and the test is required for 24 drug substances; the Guidelines for the Analysis of Impurities in Drugs; Guidance for the Quality Control of Positron Emission Tomographic and Technetium [^{99m}Tc] Radiopharmaceutical Preparations are also admitted. In Volume III, new methods, such as Determination of Reverse Transcriptase Activity and Test for Residual Aluminum Content in Human Albumin etc. are admitted, and some test methods are improved such as the test for residual bovine serum albumin and test for residual CHO cell protein, etc. On consideration of the status quo of medical industry and practical situation of drugs for clinical use, the requirements set forth in Detailed Regulations for Clarity Test and Criteria formerly issued by the Ministry of Health are replaced by the method for Determination of Visible Particles in this edition so as to enhance the safety of pharmaceuticals including injections.

According to the theory of traditional Chinese medicine—diagnosis and treatment based on an overall analysis of the illness and the patient's condition, the *Indications* under the Chinese patent preparations have been scientifically standardized, so as to avoid the phenomenon of easy misleading usage of drugs and to give prominence to features of the above theory. At the same time, the attention should be paid to the fact that a phenomenon of “different diseases having same syndrome” and “same disease having different syndromes” exists between “Syndrome” in traditional Chinese medicine and “Disease” in Western medicine. The close combination of “Syndrome” in traditional Chinese medicine and corresponding “Disease” in Western medicine embodies the scientificity and accuracy of the expression of *Indications*, so as to ensure clinicians to understand the *Indications* precisely and make use of drugs rationally, thus facilitating the sound development of traditional Chinese medicine in the new era.

The working procedures for preparation of this edition also has been improved. In addition to the traditional way of requesting for comments, the contents of revised appendices and monographs should be publicized on the website of the Chinese Pharmacopoeia Commission for three months, aiming at collecting comments widely from various institutions and organizations. All the feedbacks and inputs should be reviewed by the relevant subcommittee to ensure the feasibility and practicability of the standards and methods revised in this edition of Pharmacopoeia, and ensure that the principle of “openness, justice and fairness” is kept in the process of compiling and editing.

In order to make it easy for reading, *the Chinese Pharmacopoeia 2005* adopts the half-measure in its layout for the first time, and the improvement of quality in printing and binding makes this edition look more elegant.

Thanks to the well-organized work by the Secretariat of the Chinese Pharmacopoeia Commission, the joint efforts made by all the participants and the support from institutions and organizations concerned, the compilation of *the Chinese Pharmacopoeia 2005* proceeded smoothly and the goal is reached as designed despite the heavy work schedule and high requirements for the task. Now *the Chinese Pharmacopoeia 2005* is presenting its new style in front of the world and will play a greater role both in initiating new prospect of national drug administrative work and in the development of the medical industry in China.

郑筱萸

Chairman, the eighth Chinese Pharmacopoeia
Commission of the People's Republic of China

(December 2004)

History of the Pharmacopoeia of the People's Republic of China

The Chinese Communist Party and the Chinese Government have attached great importance to medical and health care of the Chinese people. The People's Republic of China was founded on October 1, 1949 and right in November of that year the Ministry of Health convened a meeting of medical and pharmaceutical experts in Beijing on the compilation of a pharmacopoeia. In January 1950, the Ministry of Health invited Professor Meng Mudi, a well-known pharmacist from Shanghai, to take up the responsibility for the establishment of the Editorial Commission of Pharmacopoeia of China and its secretariat to deal with daily work concerning the compilation of such a compendium for new China.

In April 1950, a working seminar was held in Shanghai, at which the principles and guidelines on the selection of monographs were discussed and the monographs to be included in the Pharmacopoeia were decided. It was recommended under the direction of the Ministry of Health that the new Pharmacopoeia should be compiled in such a way that it is in conformity with the Chinese situations and that it should be nationalistic, scientific and popular in nature. Thereafter, The Ministry of Health invited 49 experts as members and 35 as correspondent members of the Commission who were appointed to 8 panels (nomenclature, chemicals, pharmaceutical preparations, medicaments of plant origins, biological products, medicaments of animal origins, pharmacology, and dosage) respectively. Health Minister Li Dequan served as the chairperson of the Commission. The first Editorial Commission of Pharmacopoeia of the People's Republic of China was thus formally established.

The first Editorial Commission meeting composed of all members was held in Beijing April 24-28, 1951, where resolutions were made on the title of the Pharmacopoeia, list of selected monographs, the nomenclatures, units of measurement and weights, format, the order of arrangement etc. Based on recommendations from the Commission meeting, the draft of the pharmacopoeia was then revised by the Secretariat and submitted to the Ministry of Health for review and the Culture and Education Commission of the State Council for approval at the end of 1952. The Ministry of Health published the first *Chinese Pharmacopoeia* in 1953.

The Chinese Pharmacopoeia 1953 edition contained 531 monographs of substances and articles, including 215 chemicals, 65 medicaments from plant origins, oils and fats, 13 medicaments from animal origins, 2 antibiotics, 25 biological products, and 211 pharmaceutical preparations. After the publication of the Pharmacopoeia the first addendum of the 1953 edition was published in 1957.

The Ministry of Health set up the second Chinese Pharmacopoeia Commission in 1955, with 49 members and 68 correspondent members. Due to various reasons, this Commission failed to fulfill its mission. The third Commission was established in 1957, with 80 members (no correspondent members appointed) and

Professor Tang Tengan, a well-known pharmaceutical chemist, as its chairman. The first meeting of the third Commission was convened from July 28 to August 5 of the same year. Health Minister Li Dequan pointed out at the meeting that it was a big flaw that the first Pharmacopoeia did not cover Chinese traditional medicines that the Chinese people were so used to. At the meeting principles in compiling a Pharmacopoeia were made and nature and purpose of such a compendium were discussed and constitution of the Commission was revised. It was agreed unanimously to admit well-defined Chinese traditional medicines to the Pharmacopoeia. On August 27, six expert committees and a panel under the Commission were approved and set up by the Ministry of Health, namely, the committees of medicines, chemicals, pharmaceutical preparations, biochemicals, pharmacognosy and biological products, and a panel of nomenclature. Under the Commission a Standing Committee was organized, however, routine work in general was dealt with by its Secretariat.

In 1958, it was recommended by the Standing Committee and approved by the Ministry of Health to invite 8 doctors of Chinese traditional medicine and 3 experts of Chinese traditional medicaments as members of an expert committee dealing with the quality specifications of crude drugs used as Chinese traditional medicaments and Chinese patent preparations. Collaborative efforts were made by experts in this field in many parts of this country to incorporate the theory and practical experience of Chinese traditional medicine into the monographs concerned.

The second meeting of this Commission was held in Beijing from June 25 to July 5, 1959. A list of monographs being admitted to the new Pharmacopoeia was proposed and the draft texts reviewed in detail by the expert committees concerned. The work was accomplished in 1962. The State Council approved the publication of the Pharmacopoeia of the People's Republic of China 1963 edition. On January 26, 1965, the Ministry of Health issued a document for *the Chinese Pharmacopoeia 1963* edition and the relevant provisions for its implementation.

The Chinese Pharmacopoeia 1963 edition contained 1310 monographs in its two volumes, each with separated General Notices and relevant appendices. 446 monographs of commonly used Chinese traditional medicaments and 197 monographs of Chinese traditional patent preparations were admitted to Volume I, and 667 monographs of chemical drugs were admitted to Volume II. Additionally, "therapeutic function and chief indication" were stated in the monographs admitted to Volume I and "action and use" of those admitted to Volume II.

The Chinese Pharmacopoeia Commission stopped functioning in 1966 due to the turmoil caused by the "Cultural Revolution". On April 28, 1972, the State Council agreed to the suggestion in the report of the Ministry of Health that "the Commission should be re-established with the participation of Ministries of Health, Petroleum and Chemical industry, Commerce and the PLA's Ministry of Health, headed by the Ministry of Health". A working meeting of the Chinese Pharmacopoeia Commission was convened under the above direction from May 31 to June 10 of the same year in Beijing. 88 representatives of various competent authorities and organizations, including all Provincial (Autonomous regional or Municipal) Departments of Drug Policy and Management, Institutes for Drug Control and others attended the meeting. The focus of the meeting was on the guiding principle, working process, requirements and objects of the editing of the national Pharmacopoeia. The revision plan was recommended after exchange of past experiences in various aspects. Arrangements were made for the drafting of individual monographs by the organizations concerned. The second meeting of the Chinese Pharmacopoeia Commission was held

in Beijing in April 1973. Some guidelines, basic requirements of the Pharmacopoeia and sample monographs for Chinese traditional medicaments and modern medicinal substance as well as the respective explanatory notes had been well discussed and appropriate recommendations were made. The drafting of individual monographs was rearranged according to the place of origin of Chinese medicines and the conditions of pharmaceutical production. On October 4, 1979 the Ministry of Health promulgated that *the Chinese Pharmacopoeia 1977* edition would come into use on January 1, 1980. The total of monographs contained in the 1977 edition is 1925. In Volume I, 1152 monographs were admitted, including 882 monographs of Chinese herbal drugs in general used and in the region of national minorities, extracts of Chinese herbal medicines, oils and fats and some preparation made of single medicinal ingredient. 270 monographs of Chinese traditional patent preparations (including those preparations used in the region of national minorities) were also admitted in the Volume I. 773 monographs of chemicals and biological products etc. were admitted in Volume II.

In 1979 the Ministry of Health invited 112 experts as members to form the fourth Chinese Pharmacopoeia Commission, and Health Minister Qian Xinzong was its Chairman. The first plenary meeting of that Commission was held from Nov. 22 to Nov. 28 in the same year in Beijing. Discussion and amendment were made on the constitution of the commission, provisions for the management of specifications for pharmaceutical preparations and its working plan in the meeting. Ten specialized advisory groups were appointed in the fields of Chinese traditional medicine, Chinese traditional medicaments, medicine and pharmacology, chemicals, biochemicals, pharmaceutical preparations, antibiotics, biological products, radiopharmaceuticals and nomenclature respectively. Monographs being admitted to the new Pharmacopoeia were recommended by the advisory groups concerned. The advisory group on Chinese traditional medicine had the responsibility to review and select the range of monographs to be included in Volume I and the advisory group on medicine and pharmacology had the same responsibility for Volume II. The institutes for drug control and competent authorities or organizations in the locality (provinces, autonomous regions and municipalities), where the drug substance concerned was produced provided draft text of individual monograph with prominent experience and excellent quality. Coordinated review and technical validation were organized by the Secretariat. Some monographs were drafted only after the completion of objective collaborative studies as required. Finally, members of respective advisory groups and representatives of institutes for drug control and drug manufacturers concerned reviewed the draft text, and then sent to the Ministry of Health for approval. *The Chinese Pharmacopoeia 1985* edition was published in September 1985 as planned. The effective date was set on April 1, 1986 as approved by the Ministry of Health. In this edition of Pharmacopoeia, 1489 monographs of drugs were admitted. 506 monographs of Chinese traditional medicaments, crude drugs, vegetable oils and fats and preparations of single ingredient, 207 monographs of Chinese traditional patent preparations, totally amount to 713 monographs were admitted to Volume I. 776 monographs of chemicals, biological products etc. were admitted to Volume II.

The "Drug Administration Law of the People's Republic of China" came into effect on July 1, 1985. It stipulated that "the quality of drugs and medicines must comply with a national, provincial, autonomous regional or municipal standard", and that "the Pharmacopoeia of People's Republic of China and standards for drugs and medicines published and promulgated by Ministry of Health of the State Council are national standards for drugs and medicines". It further stated, "The Chinese Pharmacopoeia Commission subordinate to the Ministry of Health of the State Council is responsible for the stipulation and revision of national standards for drugs and medicines". It defines clearly the official nature of standards for drugs

and medicines and responsibilities of the Commission.

In 1986 the Ministry of Health reorganized the Chinese Pharmacopoeia Commission in accordance with its constitution and invited 150 experts as members of the fifth Commission with Health Minister Cui Yueli as Chairman. The office dealing with routine work was changed to a system with the Secretary General as its chief executive officer. The first meeting of this Commission was convened May 5-8 of the same year. The constitution of the Commission was revised. Comments were made on the task of drug standardization during the seventh Five-year Plan for National Reconstruction. The guidelines and principles of the 1990 edition of the pharmacopoeia were discussed and agreed at the meeting. Panel meetings on Chinese traditional medicaments, Chinese patent preparations, chemicals, antibiotics, biochemicals and pharmacology were held respectively for the tasks of drafting different parts of the next edition and necessary research projects to be carried out. The addendum to *the Chinese Pharmacopoeia 1985* edition was published in November 1987 with 23 new admissions and 172 specific monographs and 21 general monographs were revised or amended. Based on *the Chinese Pharmacopoeia 1985* edition, its first English version was formally published in October 1988. Also published in that year were the selected notes in Volume II. By March 1989, the draft text of the new pharmacopoeia was basically ready for comments through the efforts made by various organizations and associations. The Secretariat of the Chinese Pharmacopoeia Commission was authorized to organize reviewing and editing. In December 1989, an extended meeting attended by the chairman, vice-chairmen of the Commission and the chairmen of all advisory groups was held in Beijing. It was recommended to send the draft text to the Ministry of Health for comments and approval. The Ministry of Health then publishes it as *the Chinese Pharmacopoeia 1990* edition, on December 3, 1990 with effective date on July 1, 1991.

This new edition of the pharmacopoeia is still published in two volumes containing 1751 monographs of substances and articles. 784 monographs including 509 monographs of Chinese traditional medicaments and 275 monographs of Chinese traditional patent preparations and single ingredient preparations are admitted to Volume I, while 967 monographs on chemicals, antibiotics, biological products and pharmaceutical preparations are admitted to Volume II. In comparison with the preceding edition, 80 new monographs are admitted and 3 monographs deleted from Volume I; 213 new monographs are admitted (including 5 monographs transferred from Volume I to Volume II) and 25 monographs deleted (3 from Volume I and 22 from Volume II). Appropriate changes have been made on titles of certain drug substances and articles as required. The headings "Action and use" and "Administration and dose" are changed to "Category" and "Dosage" respectively. "A Guide to Clinical Use of Drugs" was published as a companion volume to *the Chinese Pharmacopoeia* to serve as a guiding reference for medical and pharmaceutical practices. The infrared reference spectra are deleted from the Appendix with the publication of a separate volume—the Atlas of Infrared Spectra of Drugs.

The sixth Chinese Pharmacopoeia Commission was organized in 1991 with 168 members invited by the Ministry of Health, and Health Minister Chen Minzhang as its chairman. The first meeting of that Commission took place May 16-18 of the same year, attended by all members. In this meeting, the constitution of the Commission was further revised and the working plan for compilation and editing of *the Chinese Pharmacopoeia 1995* edition were discussed and substantial recommendations were made. A Standing Committee composed of the chairman, vice chairman and 11 other experts were set up with 13 subcommittees in respective specialized fields, namely, Chinese traditional medicine, Chinese traditional medicaments, Chinese traditional patent medicines, Modern medicine, Pharmacology, Chemicals I, II

and Ⅲ, Antibiotics, Biochemicals, Biological products, Radiopharmaceuticals and Nomenclature. The subcommittees then convened extended meetings in their specific fields, respectively, to work out the programs for revision of the Pharmacopoeia.

Drafts of the appendices of the 1995 edition were sent out in 1993 to relevant local organizations as a reference for the compilation and revision of the new edition. By July 1994 almost all local drafting had been finished and the subcommittees started organizing reviews. On Nov. 29, 1994 the drafts were discussed and further reviewed at an extended meeting of the Standing Committee, and then submitted to the Ministry of Health for approval. *The Chinese Pharmacopoeia 1995* edition came into use as of April 1, 1996 as promulgated by the Ministry of Health.

There are 2375 monographs in that edition. 920 monographs, including 522 monographs of Chinese traditional crude drugs and of oils and fats, 398 monographs of Chinese traditional patent medicines and of preparations of single ingredient were admitted to Volume I. In Volume II, it was composed of 1455 monographs of chemicals, antibiotics, biochemicals, radiopharmaceuticals, biological products and some excipients. In comparison with the previous edition, 142 and 499 new admissions were admitted in Volume I, II respectively. English titles of drugs and preparation were adopted in Volume II and the Latin titles were deleted, while Chinese titles only use their official common names and no alternate names. The first Volume (1995 edition) of "Atlas of Infrared Spectra of Drugs and Medicines" was also compiled. "A Guide of Clinical Use of Drugs" was revised, and published together with the 1995 edition of *the Chinese Pharmacopoeia*. Ministry of Health approved that the "Indication" and "Dosage" in the later should be adopted as the basis for promotion of drug administration and management by competent authorities of drug management and drug manufacturing.

The sixth Chinese Pharmacopoeia Commission published the first and second addenda in 1992 and 1993, respectively. It also published "Commentary to Volume II of *the Chinese Pharmacopoeia 1990* edition". "Selected Commentary to Volume I of *the Chinese Pharmacopoeia 1990* edition", "Atlas of Traditional Chinese Medicines", "Atlas of Thin Layer Chromatography of Chinese Traditional Medicines" and "Adopted names of Chinese pharmaceutical products" as references in series relevant to pharmacopoeia. English version of *the Chinese Pharmacopoeia 1990* edition was published in July 1993.

To strengthen standardization of drugs and medicines, the Ministry of Health decided, on May 21, 1993, that the Secretariat of the Chinese Pharmacopoeia Commission separated from the National Institute for the Control of Pharmaceutical and Biological Products and subordinated directly to the Ministry of Health. That was an important reform measure in the restructuring of the Commission.

Approved by the Ministry of Health, the seventh Chinese Pharmacopoeia Commission was set up in May 1996. The Ministry invited 204 members, including 18 honorary members, to form the Commission. Health Minister Chen Minzhang served as its Chairman. In September 1998 as approved by Document No. 32 (1998) of Central Office of Organization, the name of Pharmacopoeia Commission of the Ministry of Health was changed to the Chinese Pharmacopoeia Commission, and the administration of the Commission was transferred to the State Drug Administration (SDA). After change of the management system and passing away of Health Minister Chen Minzhang, the Standing Committee of the seventh Pharmacopoeia Commission decided to appoint chairman and vice chairmen of the Commission, as so stipulated in its Constitution in December 1999. Under that Commission there were 16 specialty

subcommittees: Chinese traditional medicine, Chinese traditional medicaments I, II, III, and IV, modern medicine, nomenclature, appendices, pharmaceutical preparations, pharmacology, chemicals I and II, antibiotics, biochemicals, radiopharmaceuticals and biological products.

The first meeting of the seventh Commission was held in 1996, at which the design plans for the 2000 edition of *the Chinese Pharmacopoeia* were endorsed. The guiding principles decided were that the Volume I should have special features in content and its quality should be largely improved, and the Volume II should reflect the combination of improvement and suitability to specific situations in China as well as a combination of advancement and characteristics. As scheduled in the plans, all subcommittees convened their own meetings and carried out their tasks starting from October 1996. By the end of 1997, all revision of the appendixes and general rules for drug and medicine preparations had been finished and sent to local drafting organizations for comments. A first draft was finalized at the end of 1998, and after reviews by related organizations in different parts of China; the 16 subcommittees further reviewed it by the end of October 1999. *The Chinese Pharmacopoeia 2000* edition was finally reviewed and passed by the seventh Chinese Pharmacopoeia Commission in December 1999, and submitted to the State Drug Administration for approval of publication. This edition was published in January 2000 and come into effect from July 1, 2000.

The 2000 edition contains a total of 2691 monographs, with 992 ones in Volume I and 1699 in Volume II. There are 399 new monographs and 562 revised ones in this edition. Appendixes have been considerably improved. There are 10 new and 31 revised appendixes in Volume I, and 27 new and 32 revised ones in Volume II. The Volume II has, for the first time, included 6 guidelines for Validation of Analytical Method Adopted in Pharmaceutical Quality Specification etc., which will play a role in the standardization and regulation of testing methods. Application of modern analytical techniques is further enhanced and stressed in this edition.

The seventh Chinese Pharmacopoeia Commission has also compiled the 1997 and the 1998 addendum of *the Chinese Pharmacopoeia 1995* edition, the “Adopted Names of Chinese Pharmaceutical Products (1998 Addendum)”, “Atlas of Infrared Spectra of Drugs and Medicines” (Volume II) and the third edition of “A Guide to Clinical Use of Drugs”. The English edition of *the Chinese Pharmacopoeia 1995* was published in 1997. To strengthen exchanges and cooperation, this Commission has decided to publish concurrently both Chinese and English versions of *the Chinese Pharmacopoeia 2000* edition.

“Dosage” and “Precaution” in preceding editions are too simple to reflect accurately the actual clinical use of drugs therefore deleted from this edition (Volume II) as so proposed in the design plans for the relevant contents of those two headings have been included in “A Guide to Clinical Use of Drugs”.

Approved by the State Drug Administration (redesigned to be State Food and Drug Administration in September 2003), the eighth Chinese Pharmacopoeia Commission was set up in October 2002. The State Drug Administration invited 312 experts as members of the Commission and did not appoint any honorary member. The Commissioner of the State Drug Administration, Mr. Zheng Xiaoyu served as its Chairman. The Standing Committee of the Commission was assigned as Executive Committee. The plenary session of the Chinese Pharmacopoeia Commission was authorized to examine and approve *the Chinese Pharmacopoeia* and the important items of the national specifications for pharmaceutical preparations. 24 subcommittees of specific duty and/or appointment are set up under the Commission. On the basis of previous Commission, 3 new subcommittees were established; namely ethnic medicines, microorganism, and packing materials and excipients; former subcommittee of biological products was expanded to 6 ones,

namely: blood products, viral vaccines, bacterial vaccines, somatic cell therapy and gene therapy, recombinant DNA products and diagnostic reagents for *in vivo test*.

The first meeting of the eighth Chinese Pharmacopoeia Commission and its Executive Committee took place in October 2002, approved “the design plans for the 2005 edition of *the Chinese Pharmacopoeia*”. The design plans clearly indicated that the *Pharmacopoeia* should adhere to guiding principles of “succession and development” and “theory combined with practice”; and editing principles of pharmacopoeia should be adhered to scientific, practical and specific basis. The meeting decided that *Requirements for Biologics of the People’s Republic of China*, known as the *Chinese Requirements for Biologics* (CBR), would be integrated into the pharmacopoeia as its Volume III; “A Guide to Clinical Use of Traditional Chinese Patent Preparations” is to be compiled for the first time.

All designated subcommittee meetings have been convened since November 2002, to deal with the assigned duty recommended on the meeting in various aspects. By July 2003, the draft of appendices was accomplished at first and sent to relevant authorities and institutions for comments. Early in 2004, the first draft of appendices and text of pharmaceutical and biological products was basically ready and consecutively published on the website of the Chinese Pharmacopoeia Commission for 3 months, so as to get the feedbacks from various organizations and associations. Subcommittees, one after the other, convened meetings to review and revise the drafts from June to August, the Executive Committee of eighth Chinese Pharmacopoeia Commission endorsed *the Chinese Pharmacopoeia 2005* in September of the same year. In December 2004, the draft text was sent to the State Food and Drug Administration for approval and promulgation. *The Chinese Pharmacopoeia 2005* was published on January 2005 with effective date on July 1, 2005. The number of monographs in *the Chinese Pharmacopoeia 2005* is considerably increased. It contains up to 3214 monographs of drugs and other articles with 525 new admissions. Volume I contains 1146 monographs, with 154 new admissions and 453 revised; Volume II deals with 1967 monographs, with 328 new admissions and 522 revised; Volume III contains 101 monographs, with 44 new admissions and 57 revised. 9 monographs adopted in *the Chinese Pharmacopoeia 2000* are deleted in this edition. 123 monographs adopted in the *Requirements for Biologics of the People’s Republic of China 2000* and in its *Supplement 2002* are not admitted in this edition.

The numbers of appendices in this edition are as follows: 98 monographs admitted in Volume I with 12 new admissions, 31 revised and 1 deleted; 137 monographs in Volume II with 13 new admissions, 65 revised and 1 deleted; 140 monographs in Volume III with 62 new admissions, 78 revised and 1 deleted. Appropriate monographs common to all three volumes are presented in each volume respectively in a harmonized and unified form.

Under the active leadership of the Chairman of the Chinese Pharmacopoeia Commission, the issue of pharmaceutical safety is emphasized particularly. In Volume I, atomic absorption spectrophotometry and inductively coupled plasma mass spectrometry are applied to determine the deleterious elements (lead, cadmium, mercury, arsenic and cuppers) and the limits of these elements have been stipulated; the guidelines of the safety test for the injections of traditional Chinese medicines is also added to the Volume I. In Volume II, the Test for Particulate Matter in Injections is applied to 126 injections intended for intravenous injections; the number of monographs adopting the Test for Bacterial Endotoxin reaches 112; the Determination of Residual Solvents includes the requirements of International Conference on

Harmonization (ICH) for residual solvents, and the test is required for 24 drug substances; In Volume II, the Guidelines for Analysis of Impurities in Drugs, Guidance for the Quality Control of Positron and Technetium [^{99m}Tc] Radiopharmaceutical Preparations are also admitted. In Volume III, new methods such as Determination of Reverse Transcriptase Activity and Test for Residual Aluminum Content in Human Albumin etc. are admitted, and some test methods are improved such as the test for residual bovine serum albumin and test for residual CHO cell protein, etc. On consideration of the status quo of medical industry and practical situation of drugs for clinical use, the requirements set forth in Detailed Regulations for Clarity Test and Criteria formerly issued by the Ministry of Health are replaced by the method for Determination of Visible Particles in this edition so as to enhance the safety of pharmaceuticals including injections.

The Chinese Pharmacopoeia 2005 attaches great importance to the consistent principle of environmental protection, therefore the harmful solvents, such as benzene etc. used in pharmaceuticals should be substituted by other solvents as far as possible.

According to theory of Traditional Chinese Medicine—diagnosis and treatment based on an overall analysis of the illness and the patient's condition, the *Indications* under the Chinese patent preparations have been scientifically standardized so as to provide the assurance of understanding the *Indications* precisely and making use of drugs rationally, and to facilitate the healthy development of traditional Chinese medicine.

Volume III of this edition is originated from *CBR*. Six editions of the *CBR* have been promulgated for implementation since 1951, i. e. the edition 1951 and its addendum 1952, and the edition 1959, 1979, 1990 and 1993 (for diagnostic products), 1995 and 2000 and its supplement were published respectively. The English version of *CBR 2000* was published for the first time in 2002.

The eighth Chinese Pharmacopoeia Commission also has completed the Addendum 2002 and Addendum 2004 of *the Chinese Pharmacopoeia 2000*, the Adopted Names of Chinese Pharmaceutical Products (2005 edition), Atlas of Infrared Spectra of Drugs and Medicines (third volume) and “Guide to Clinical Use of Drugs” (the first edition for Chinese traditional patent preparations and the fourth edition for chemicals).

The English version of *the Chinese Pharmacopoeia 2005* was completed in 2005. In order to enhance the international cooperation and communication, the Chinese Pharmacopoeia Commission has organized the first “China-USA joint forum on Pharmacopoeia”.

Aiming at the strengthening and improving the efficiency and level of national standard work, the Secretariat of the Chinese Pharmacopoeia Commission has completed the construction of office automation and realized standards enacted the Chinese for computer network retrieval and statistical analysis.

New Admissions

Aciclovir Capsule	Bulleyaconitine A
Aciclovir Chewable Tablets	Calcitonin (Salmon) Injection
Aciclovir Cream	Calcium Carbonate Chewable Tablets
Aciclovir Eye Drops	Calcium Carbonate Granules
Aciclovir for Injection	Calcium Folate Capsules
Aciclovir Granules	Calcium Folate Tablets
Aciclovir Tablets	Carbachol Injection
Adenosine Disodium Triphosphate	Carbachol
Adenosine Disodium Triphosphate for Injection	Carbocisteine Granules
Adenosine Disodium Triphosphate Injection	Carmofur Tablets
Alarelin Acetate for Injection	Carmofur
Alarelin Acetate	Cefathiamidine for Injection
Alfacalcidol Tablets	Cefathiamidine
Alfacalcidol	Cefdinir Capsules
Almitrine Bismesylate	Cefdinir
Alprostadil for Injection	Ceftezole Sodium for Injection
Alprostadil	Ceftezole Sodium
Amantadine Hydrochloride Granules	Cimetidine and Sodium Chloride Injection
Amantadine Hydrochloride Syrup	Ciprofloxacin
Ambroxol Hydrochloride Capsules	Citicoline Sodium for Injection
Ambroxol Hydrochloride Oral Solution	Citicoline Sodium Injection
Ambroxol Hydrochloride Sustained-release Capsules	Citicoline Sodium
Ambroxol Hydrochloride Tablets	Clarithromycin Granules
Ambroxol Hydrochloride	Clobetasol Propionate Cream
Amrinone for Injection	Clomipramine Hydrochloride Injection
Amrinone	Codeine Phosphate and Platycodon Tablets
Arginine Hydrochloride Tablets	Coenzyme Q ₁₀ Soft Capsules
Arginine	Compound Almitrine Tablets
Asparagine Tablets	Compound Aspartate, Vitamin B ₆ and Dipotassium Glycyrhetate Eye Drops
Asparagine	Compound Bismuth Aluminate Capsules
Aspirin Effervescent Tablets	Compound Camphor Tincture
Aspirin Enteric Capsules	Compound Dexamethasone Acetate Cream
Aspirin, Heavy Magnesium Carbonate and Dihydroxyaluminium Aminoacetate Tablets	Compound Furosemide Tablets
Azithromycin Dispersible Tablets	Compound Glycyrrhiza Oral Solution
Azithromycin Granules	Compound Ketoconazole Cream
Bendazac Lysine Eye Drops	Compound Miconazole Nitrate Cream
Bendazac Lysine	Compound Sodium Chloride Eye Drops
Benorilate, Pseudoephedrine Hydrochloride and Chlorphenamine Maleate Tablets	Compound Sulfamethoxazole Oral Suspension
Benproperine Phosphate Granules	Compound Zedoary Turmeric Oil Suppositories
Benproperine Phosphate Oral Solution	Cydiodine Buccal Tablets
Benzathine Benzylpenicillin	Daunorubicin Hydrochloride for Injection
Bifonazole Suppositories	Daunorubicin Hydrochloride
Bisacodyl Suppositories	Dexamethasone Tablets
Black Ferric Oxide	Diclofenac Sodium and Codeine Phosphate Tablets
Black Ferric Oxide	Diffunisal Capsules
Brown Ferric Oxide	Diffunisal
Brown Ferric Oxide	Dipivefrin Hydrochloride Eye Drops
Bulleyaconitine A Oral Solution	Dipivefrin Hydrochloride
Bulleyaconitine A Tablets	

Doxorubicin Hydrochloride for Injection	Ibuprofen Syrup
Doxorubicin Hydrochloride	Indocyanine Green for Injection
Enalapril Maleate Capsules	Indocyanine Green
Enalapril Maleate Tablets	Inosine Capsules
Enalapril Maleate	Inosine Injection
Enoxacin Eye Drops	Inosine Oral Solution
Erythromycin Ethylsuccinate Capsules	Inosine Tablets
Erythromycin Ethylsuccinate Dispersible Tablets	Inosine
Estradiol Sustained-release Patches	Isosorbide Dinitrate Spray
Ethacriding Lactate Solution	Ketotifen Fumarate Eye Drops
Etimicin Sulfate for Injection	Kitasamycin Tablets
Etimicin Sulfate Injection	Kitasamycin
Etimicin Sulfate	Levodopa and Benserazide Hydrochloride Capsules
Etoposide Injection	Levodopa and Benserazide Hydrochloride Tablets
Etoposide	Lidocaine Carbonate Injection
Famciclovir Capsules	Ligustrazine Phosphate Capsules
Famciclovir Tablets	Ligustrazine Phosphate Injection
Famciclovir	Ligustrazine Phosphate Tablets
Felodipine Tablets	Ligustrazine Phosphate
Felodipine	Lofexidine Hydrochloride Tablets
Ferrous Fumarate Chewable Tablets	Lofexidine Hydrochloride
Ferrous Fumarate Granules	Meleumycin Tablets
Fleroxacin Capsules	Meleumycin
Fleroxacin Tablets	Meloxicam
Fleroxacin	Meropenem for Injection
Fluconazole Tablets	Meropenem
Fosfomycin Calcium Capsules	Metamizole Sodium Nasal Drops
Fosfomycin Calcium Granules	Methacrylic Acid Copolymer I
Fosfomycin Calcium Tablets	Methacrylic Acid Copolymer II
Fosfomycin Calcium	Metoprolol Tartrate Sustained-release Tablets
Fosfomycin Trometamol Powder	Miconazole Nitrate Liniment
Fosfomycin Trometamol	Micronomicin sulfate Injection
Gadopentetate Dimeglumine Injection	Micronomicin sulfate Oral Solution
Ganciclovir and Sodium Chloride Injection	Micronomicin sulfate Tablets
Ganciclovir for Injection	Micronomicin sulfate
Ganciclovir	Mifepristone Tablets
Glipizide Capsules	Mifepristone
Gliquidone Tablets	Minocycline Hydrochloride Capsules
Gliquidone	Minocycline Hydrochloride Tablets
Glycerol and Fructose Injection	Minocycline Hydrochloride
Glycerol for Injection	Moclobemide Capsules
Glycine Irrigation Solution	Moclobemide Tablets
Glycopyrrolate Tablets	Moclobemide
Glycopyrrolate	Moracizine Hydrochloride Tablets
Granisetron Hydrochloride Injection	Moracizine Hydrochloride
Granisetron Hydrochloride Tablets	Naphazoline Hydrochloride Eye Drops
Granisetron Hydrochloride	Naphazoline Hydrochloride, Chlorphenamine Maleate and Vitamin B ₁₂ Eye Drops
Halcinonide Film	Naproxen and Codeine Phosphate Tablets
Heparin Sodium Cream	Nicardipine Hydrochloride and Glucose Injection
Huperzine A Capsules	Nicardipine Hydrochloride Injection
Huperzine A Injection	Nimodipine Capsules
Huperzine A Tablets	Nimodipine Dispersible Tablets
Huperzine A	Nimodipine Injection
Hydrocortisone Sodium Succinate for Injection	Nimodipine Tablets
Hydrocortisone Sodium Succinate	Nimodipine
Ibuprofen and Pseudoephedrine Hydrochloride Tablets	Nitroglycerin Aerosol
Ibuprofen Capsules	Norfloxacin Cream
Ibuprofen Drops	Ofloxacin Capsules
Ibuprofen Oral Solution	

Ofloxacin Ear Drops	Rifampicin and Isoniazid Capsules
Ofloxacin Eye Drops	Rifampicin and Isoniazid Tablets
Ofloxacin Eye Ointment	Rifampicin for Eye Use
Omeprazole Enteric-coated Capsules	Rifampicin Isoniazid and Pyrazinamide Capsules
Omeprazole Enteric-coated Tablets	Rifampicin Isoniazid and Pyrazinamide Tablets
Omeprazole	Roxithromycin Dispersible Tablets
Ondansetron Hydrochloride Injection	Roxithromycin for Suspension
Ondansetron Hydrochloride Tablets	Salbutamol Sulfate Sustained-release Capsules
Ondansetron Hydrochloride	Salbutamol Sulfate Sustained-release Tablets
Opium Tablets	Sodium Ferulate for Injection
Oxaprozin Enteric-coated Capsules	Sodium Ferulate Tablets
Oxaprozin Enteric-coated Tablets	Sodium Ferulate
Pantoprazole Sodium	Sodium Glycerophosphate Injection
Paracetamol and Caffeine Tablets	Sparfloxacin Capsules
Paracetamol Chewable Tablets	Sparfloxacin Tablets
Paracetamol Drops	Sparfloxacin
Paracetamol Effervescent Tablets	Sucralfate Dispersible Tablets
Paracetamol Gel	Sucralfate Oral Solution
Paracetamol Granules	Sultamicillin Tosilate Capsules
Paroxetine Hydrochloride Tablets	Sultamicillin Tosilate Granules
Pefloxacin Mesylate Capsules	Taurine Capsules
Pefloxacin Mesylate for Injection	Taurine Eye Drops
Pefloxacin Mesylate Injection	Tegafur Capsules
Pefloxacin Mesylate Tablets	Testosterone Undecanoate Soft Capsules
Pefloxacin Mesylate	Ticlopidine Hydrochloride Capsules
Pentoxifylline Sustained-release Tablets	Ticlopidine Hydrochloride Tablets
Phenoxymethylpenicillin Potassium Capsules	Ticlopidine Hydrochloride
Piperazine Ferulate Tablets	Timolol Maleate Tablets
Piperazine Ferulate	Tinidazole and Glucose Injection
Piracetam and Sodium Chloride Injection	Tinidazole Capsules
Piracetam Capsules	Tinidazole Suppositories
Piracetam Injection	Tramadol Hydrochloride Capsules
Piracetam Oral Solution	Tramadol Hydrochloride Suppositories
Piracetam Tablets	Tramadol Hydrochloride Sustained-release Capsules
Piracetam	Tramadol Hydrochloride Sustained-release Tablets
Piroxicam Gel	Tretinoin Cream
Polymycin B Sulfate for Injection	Triamcinolone Acetonide and Econazole Nitrate Cream
Polymycin B Sulfate	Ubenimex Capsules
Polyvinyl Alcohol Resin	Ubenimex
Poppy Capsule Extractive	Valacyclovir Hydrochloride Capsules
Potassium Dehydroandrographolide Succinate for Injection	Valacyclovir Hydrochloride Tablets
Potassium Dehydroandrographolide Succinate	Valacyclovir Hydrochloride
Powdered Poppy Capsule Extractive	Vindesine Sulfate for Injection
Probuco Tablets	Vindesine Sulfate
Probuco	Vinorelbine Tartrate Injection
Puerarin and Glucose Injection	Vinorelbine Tartrate
Puerarin and Sodium Chloride Injection	Vitamin C Effervescent Granules
Puerarin Injection	Xanthinol Nicotinate Injection
Puerarin	Xanthinol Nicotinate
Purple Ferric Oxide	Xylitol Granules
Raubasine	Xylitol
Refined Corn Oil	Yellow Ferric Oxide
Ribavirin and Glucose Injection	Zedoary Turmeric Oil Injection
Ribavirin and Sodium Chloride Injection	Zein
Ribavirin Buccal Tablets	Zinc Acexamate Capsules
Ribavirin Capsules	Zinc Acexamate
Ribavirin for Injection	Zinc Citrate Tablets
Ribavirin Granules	Zinc Citrate
Ribavirin Oral Solution	

Appendices

I J	Implants	XX G	Guidance for the Quality Control of Positron Emission Tomographic Radiopharmaceutical Preparation
VIII R	Total Organic Carbon in Water for Pharmaceutical Use	XX H	Guidance for the Quality Control of Technetium [^{99m}Tc] Radiopharmaceutical Preparations
IX H	Test for Visible Particles in Injection	XX J	Guidelines for Hygroscopicity
IX J	Mass Spectrometry	XX K	Guideline for Near-infrared (NIR) Spectrophotometry
X J	Determination of Patches Adhesion

XX F	Guidelines for the Analysis of Impurities in Drugs		

Omissions or Adjustments included in Volume II (2000 Edition)

Ciprofloxacin Lactate
Enterosoluble Capsules

Kanamycin Monosulfate
Vacant Capsules

Appendices

II General Requirements for Biological Products
(moved into Volume III of the Pharmacopoeia)
IV B Colourimetry (incorporated into IV A Ultraviolet-Visible Spectrophotometry)

XX F Guideline for Application of Bacterial Endotoxin
Tests (incorporated into XI E Test for Bacterial
Endotoxin)

General Notices

The Pharmacopoeia of the People's Republic of China known as Chinese Pharmacopoeia in abbreviation, is the official general scientific and technical provisions for drug quality control and administration.

Where the Pharmacopoeia is issued for enforcement by the drug regulatory authority of the State Council, the same drug standard of the previous Pharmacopoeia or the original national standard shall not be used. When the Chinese Pharmacopoeia is quoted in this compendium, it denotes the current edition of the Pharmacopoeia of the People's Republic of China, except where a specific edition is indicated.

General Notices serve as the basic guidelines for the proper interpretation and application of the Chinese Pharmacopoeia in quality control. It applies to any articles, appendices and general statements related to quality control of drugs so as to obviate replication in this compendium. The related requirements in General Notices are official in the Pharmacopoeia.

The wording "unless specified otherwise" adopted in General Notices and Appendices indicates that appropriate requirement is admitted in the related monograph wherever the requirement is not conform to that specified in General Notices or Appendices.

The drugs cited in the Pharmacopoeia should be those admitted in this edition of Pharmacopoeia and comply with the requirements of corresponding monographs.

The Guidelines stated in Appendices are not considered as official requirements but used as statements in principles applied to the implementation of Pharmacopoeia, monitoring of drug quality, and revising or verifying of drug standards.

Titles and Arrangements

1. The Chinese titles of drugs admitted in the monographs are recommended according to the guideline for the nomenclature of "Chinese Approved Drug Names". The Chinese title of a drug is adopted as official designation. Unless specified otherwise, the "International Nonproprietary Name" for pharmaceutical substances (INN) is adopted as the English title.

Titles of organic chemical drugs are adopted on the basis of "Guideline for the Nomenclature of Organic Chemistry" published by the Chinese Chemical Society. The selection of main part of its chemical structure is in line with the rules of the International Union of Pure and Applied Chemistry (IUPAC).

2. The chemical structure of the drugs are portrayed according to "Guidelines for Graphic Representation of Chemical Formulae" recommended by the World Health Organization.
3. The monographs are arranged alphabetically on the English titles of drugs. Monographs for formulated preparations are followed that of drug substance on title in the Pharmacopoeia. Monographs of excipients are listed in separate section. Appendices are arranged into sections including general requirements of formulated preparations, general testing methods and guidelines.
4. The monograph of each drug substance or different dosage forms is stated with respect to following

items; (1) Title of drug substance or dosage forms; (2) Structural formula of organic chemicals; (3) Molecular formula and molecular weight; (4) Sources or chemical name of organic drugs; (5) Content or potency; (6) Formulary of the dosage form; (7) Processing; (8) Description; (9) Identification; (10) Test; (11) Assay of content or potency; (12) Category; (13) Strength or specification; (14) Storage; (15) Preparation.

Specifications

5. *Description* refers to the appearance, odour, taste, solubility and other physical constants of the drug.

(1) Appearance of a drug is the requirements of colour and external appearance.

(2) *Solubility* refers to the physical property of a drug substance. Solvents described under the monograph and the relevant solubility behaviors are stated for reference for purification or preparation of solution of a drug substance. Requirement should be stated under the item of test of the drug, if specific quality control is needed for the solubility behavior of the solvent accordingly.

Approximate solubilities of drugs are indicated by the following descriptive phrases:

Very soluble refers to that 1 g (ml) of solute is soluble in less than 1 ml of solvent;

Freely soluble refers to that 1 g (ml) of solute is soluble in 1 ml to less than 10 ml of solvent;

Soluble refers to that 1 g (ml) of solute is soluble in 10 ml to less than 30 ml of solvent;

Sparingly soluble refers to that 1 g (ml) of solute is soluble in 30 ml to less than 100 ml of solvent;

Slightly soluble refers to that 1 g (ml) of solute is soluble in 100 ml to less than 1000 ml of solvent;

Very slightly soluble refers to that 1 g (ml) of solute is soluble in 1000 ml to less than 10000 ml of solvent;

Practical insoluble refers to that 1 g (ml) of solute is not soluble completely in 10000 ml of solvent.

Testing method: Unless specified otherwise, weigh out finely powdered sample or measure an amount of liquid sample, place the sample in a certain volume of the solvent at a temperature of $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$, shake strongly for 30 seconds at an interval of 5 minutes. Observe the solubility behavior for 30 minutes. It is considered to be completely soluble, if none of the particles or droplet of the solute is observed.

(3) Physical constants or parameters including relative density, distilling range, melting point or melting range, congealing point, specific rotation, refractive index, viscosity, specific absorbance, iodine value, saponification value and acid value etc., are useful for tests for identification and give some indication of the drug purity. It is one of the chief criteria for appraisal and assessment of drug quality.

6. Testing methods given in the identification section are intended to give some of the physical and chemical characteristics of the drug, they are not designed to give a full confirmation of the chemical structure of the drug.

7. Test section under the monograph includes the testing methods and acceptance criteria, uniformity and purity requirements for manufacturing process, which are related to the safety and efficacy of the drug. The specified testing items for impurities are framed from those possibly existed and produced in the drug, which is manufactured according to the approved manufacturing process and stored under normal condition, and those impurities are needed to be controlled, such as residual solvents and related substances, etc. Revising to the relevant items may be necessary for where the manufacturing process is changed.

The drug substance intended for direct use in the preparation of sterile powders for injection should be

tested according to the corresponding requirements of the injection and conform with the requirements. Preparations, unless specified otherwise, must comply with the requirements stated under the general requirements for preparations of the Pharmacopoeia.

8. The testing methods specified under the item of Assay are designed to determine the content of active ingredient of drug substance and preparations, Chemical, instrumental or biological methods can usually be adopted.
9. *Category* refers to main action and use of the drugs or its classified scientific designation. A drug is not framed from using in other category on the basis of experiences in clinical practices.
10. *Strength* of preparations or dosage forms refers to the amount (units of potency), labelled amount (%) or content of active ingredient or ingredients in each ampoule, tablet or other unit container, or preparation. For injections, the expression "1 ml; 10 mg" indicates that the injection contains 10 mg of active ingredient in 1 ml. Specification of weight or content may also be specified for the monographs of the preparation in which the formula is listed or the concentration is indicated.
11. *Storage* refers to the basic conditions for storage and preservation of a drug. It is stated by the following terms:
 - Protected from light* refers to that a drug should be kept in light resistant container such as amber coloured container, or a colourless transparent or semitransparent container wrapped with black paper.
 - Well closed* refers to that the container is able to protect the content from extraneous matters or lose of contents on normal handling condition.
 - Tightly closed* refers to that the container should be able to protect the contents from efflorescence, deliquescence, volatilization or interference of extraneous matters.
 - Hermetically sealed or Tightly sealed* refers to that the container is sealed on fusion or sealed tightly with suitable material to protect against contamination and from permeability of air and moisture.
 - Cool place* refers to that the storage temperature is not exceeding 20°C.
 - Cool and dark place* refers to that the container is kept in the dark place, protected from light and the ambient temperature is not exceeding 20°C.
 - Cold place* refers to that the container is kept at ambient temperature of 2-10°C.
 - Normal temperature* refers to that the container is kept at ambient temperature of 10-30°C
12. The drug substances and excipients used in preparations or dosage forms should comply with the requirements stated in the individual monographs of this edition of Pharmacopoeia; for those not admitted in this edition of Pharmacopoeia their specifications should be established, which should comply with requirements for pharmaceutical use and be approved by the drug regulatory authority of the State Council. Where the same drug substance is used for different preparations, especially for preparations with different administration routes, it is necessary to establish corresponding testing items for quality control according to the clinical usage of the drug.

Testing Methods and Limits

13. The drug substances and preparations should be tested with official methods stated in the Pharmacopoeia. It is not precluded from the application of alternative methods, if they have been proved to be satisfactory in comparison with official methods accordingly. In case of doubt or

dispute, the methods of the Pharmacopoeia are authoritative for judgement.

14. Purity requirements and limits of purity of a drug substance as well as the weight (or content) variation of a preparation or dosage form stated in the monograph concerned include the values of upper and lower limits and the medium value. Whether these values are expressed in percentage or in absolute numerical value, the last decimal is a significant value.

In calculating of testing result, the last effective figure is measured in one decimal place more than the significant decimal place indicated in the requirement and round up or down to the specified decimal place by the rule of commensuration, the value obtained is compared with the limits of the standard to determine the conformity with the specified limits.

15. The percentage content of the drug substance is calculated by weight, unless specified otherwise. If an upper limit of the content of a drug is stated as over 100% it refers to a value possibly obtained by the assigned assay method in the monograph, representing the limit or permissible deviation stated in the Pharmacopoeia. In case of no upper limit is stated, the upper limit is considered to be not more than the equivalent amount of 101.0%.

The limit range of content of a preparation or dosage form is assigned on the basis of contents of active ingredient or ingredients, assay method being applied and possible change occurred in the process of manufacturing and/or storage. A 100% labelled amount of active ingredient or ingredients should be used in manufacturing process. If a certain active ingredient is known to be lowering its content in manufacturing process or in the storage period, sufficient amount of active ingredient concerned may be used to ensure that the content of the drug produced or being used in its shelf life complies with the requirements of the Pharmacopoeia.

Reference Standards, Chemical Reference Substances

16. Reference standards and chemical reference substances refer to the standard materials used in testing of identification, test and assay. Those, excluding from internal standard materials used in chromatographic methods, are established, standardized, and distributed by the institution designated by the drug regulatory authority of the State Council. Reference standards are used for bioassay in assay of potency (content) of antibiotics or biochemical drugs. The potency is expressed in units (or μg), standardized against International Reference Standard. Chemical reference substances, unless specified otherwise, are used by calculation on the basis of dried or anhydrous materials.

The establishment or alteration in unit of potency or content of reference standards and chemical reference substances should be conducted in comparison with the original reference standard, chemical reference substances or International Reference Standard by collaborative standardization, and the protocol and testing results should be reviewed and approved by audit process.

Reference standards and chemical reference substances are distributed with appropriate instruction insert to state the method of usage, quality specification (including water content etc), expiry date and amount or content of the standard material concerned.

Units of Measurement

17. The measuring apparatus used for tests and assays should comply with the relevant requirements promulgated by the technical supervision authority of the State Council.
18. The units of measurement in this edition of Pharmacopoeia:

(1) The official names and symbols of units of measurement are listed as follows: Units of length; meter m; decimeter dm; centimeter cm; millimeter mm; micrometer μm ; nanometer nm

Units of volume: liter (L); milliliter (ml); microliter (μl)

Units of mass (weight): kilogram (kg); gram (g); milligram (mg); microgram (μg)

Units of pressure: pascal (Pa); kilopascal (kPa); megapascal (MPa)

Units of kinetic viscosity : pascal seconds ($\text{Pa} \cdot \text{s}$)

Units of kinematic viscosity: square millimeter per second (mm^2/s) Units of wave number; reciprocal of centimeter (cm^{-1})

Units of density: kilogram per cubic meter (kg/m^3); gram per cubic centimeter (g/cm^3)

Units of radioactivity: becquerel (Bq); kilobecquerel (kBq); megabecquerel (MBq)

(2) Where the strengths or concentrations of the volumetric solutions and test solutions are expressed in terms of mol/L in this edition of Pharmacopoeia, the expression of “XXX volumetric solution (YYY mol/L)” is adopted for the volumetric solution which should be accurately standardized. The expression of “YYY mol/L XXX solution ” is adopted for solutions of other purpose without specific accuracy of their concentration.

(3) Temperature is expressed in $^{\circ}\text{C}$ (degree Celsius).

The temperature of a *Water bath* is $98\text{--}100^{\circ}\text{C}$, unless specified otherwise;

Hot water refers to that at a temperature of $70\text{--}80^{\circ}\text{C}$;

Slightly warm or Warm water refers to that at a temperature of $40\text{--}50^{\circ}\text{C}$;

Room temperature refers to that at a temperature of $10\text{--}30^{\circ}\text{C}$;

Cold water refers to that at a temperature of $2\text{--}10^{\circ}\text{C}$;

Ice bath refers to the bath temperature is kept at about 0°C ;

Allow to cool refers to that the object is cooled to room temperature;

(4) The symbol used for the expression of percentage is %, usually by weight, but the percentage of solutions, unless specified otherwise, refers to the number of grams of solute in 100 ml of the solution. The percentage of ethanol refers to percentage by volume at 20°C .

The following symbols may be used when needed:

% (g/g) expresses the number of grams of a solute in 100 g of solution;

% (ml/ml) expresses the number of milliliters of a solute in 100 ml of solution;

% (ml/g) expresses the number of milliliters of a solute in 100 g of solution;

% (g/ml) expresses the number of grams of a solute in 100 ml of solution.

(5) The Drop of a liquid refers to that 1.0 ml of water is equivalent to 20 drops at the temperature of 20°C .

(6) The expression “ (1 \rightarrow 10)” stated under the solution refers to a solution of 10 ml produced by adding sufficient quantity of solvent to dissolve 1.0 g or 1.0 ml of a solute. It is understood to be aqueous solution, if the solvent is not specified. In case of two or more solvents are used as a mixture, a hyphen is inserted between different solvents indicated by names, the parenthesis followed expresses the proportion of each solvent by volume in the mixture.

(7) Sieves of Chinese National Standard R40/3 series are adopted in the Pharmacopoeia and the numbers are assigned as follows:

Sieve No.	Average internal diameter of aperture (μm)	Mesh No.
1	2000 ± 70	10
2	850 ± 29	24
3	355 ± 13	50
4	250 ± 9.9	65

5	180±7.6	80
6	150±6.6	100
7	125±5.8	120
8	90±4.6	150
9	75±4.1	200

Powders are graded as follows:

Very coarse All particles pass through No. 1 sieve, not more than 20% pass through No. 3 sieve;

Coarse All particles pass through No. 2 sieve, not more than 40% pass through No. 4 sieve;

Medium All particles pass through No. 4 sieve, not more than 60% pass through No. 5 sieve;

Fine All particles pass through No. 5 sieve, not less than 95% pass through No. 6 sieve;

Very fine All particles pass through No. 6 sieve, not less than 95% pass through No. 7 sieve;

Ultra fine All particles pass through No. 8 sieve, not less than 95% pass through No. 9 sieve.

(8) Ethanol refers to that of 95% (ml/ml) in strength, unless specified otherwise.

19. The atomic weights adopted for calculating the molecular weights and the conversion factors are the values recently published by the International Union of Pure and Applied Chemistry.

Precision and Accuracy

20. The accuracy of sampling quantity and precision of testing are defined in this edition of Pharmacopoeia.

(1) The quantity obtained by weighing or measuring the substance being examined and reagent being used is expressed in Arabic figures. The required precision is expressed by the significant numerical place. For example, the measurement of "0.1 g" by weight, refers to that 0.06-0.14 g of the substance may be weighed; for "2 g", 1.5-2.5 g of the substance may be weighed; for "2.0 g", it refers to 1.95-2.05 g of the substance may be weighed; for "2.00 g", it refers to that 1.995-2.005 g of the substance may be weighed.

Weigh accurately indicates that the precision of measurement should be made to an accuracy of 0.1%; *weigh* indicates that an accuracy being made to 1%. *Measure accurately* indicates the accuracy of the volume being measured complies with the national standard of pipet being used for the measurement of required volume;

Measure indicates that the measuring cylinder or other measuring apparatus being used complies with requirements for the measurement of volume to the significant numerical place. The word *about* states that the measuring quantity should not exceed $\pm 10\%$ of the specified quantity.

(2) *Constant weight*, unless specified otherwise, refers to that the drying or ignition of a substance or material in two consecutive weighings do not differ by more than 0.3 mg. The second and subsequent weighing are made after an additional hour of drying each time under the similar condition. The second weighing of the substance or material made to constant weight by ignition is made after 30 minutes under similar condition.

(3) The expression of *calculated on the dried (anhydrous or solvent free) basis* indicates that, unless specified otherwise, the undried substance or solvent containing substance is used for the required testing. The result of "Loss on drying (moisture or solvent)" should be subtracted from the amount of substance

(4) *Blank test* refers to a test carried out in the similar manner without the substance being examined or using same amount of solvent instead of the solution being tested. The statement of *to make any necessary correction of the result with a blank test* refers to that the result is calculated by subtracting number of milliliters of titrant used in blank test from that consumed in assay of the substance being examined.

(5) The temperature for a test is at room temperature whenever the temperature is not stated. In case of that the temperature variation influences significantly to the testing result, the test should be carried out at a temperature of $25^{\circ}\text{C} \pm 2^{\circ}\text{C}$, unless specified otherwise.

Reagents, Test solutions and Indicators

21. Reagents used in tests and assays, unless specified otherwise, should comply with the requirements stated in the Appendix of the Pharmacopoeia. Different grades of reagents conform to national standards or those issued by the competent authorities may be used of choice. Test solutions, buffer solutions, indicator solutions, volumetric solutions and so on should comply with the statements or be prepared as directed in the Appendix of the Pharmacopoeia.
22. Water being used in tests and assays refer to purified water. Water being used for the test of acidity or alkalinity is of the water freshly boiled and cooled to room temperature.
23. Test for acidity or alkalinity of a solution without the statement of indicator being used refers to that Litmus paper is used.

Animal Test

24. Laboratory animals used and managed in animal tests should comply with the requirements stipulated and promulgated by competent authorities of the State Council.
The strain, age, sex etc., should comply with the requirements for quality control of drugs and biological products.
The animal tests should be adopted only in necessary condition and become less popular, as for the purity of drugs raise to higher level and more precise chemical, physical or cellular method should be applied to replace the animal test as much as possible for the quality control of drugs and biological products.

Insert sheet, Package and Labelling

25. The insert sheet of drugs should be in conformity with the requirements of “The Drug Administration Law of the People’s Republic of China”, and provisions for insert sheet promulgated by the drug regulatory authority of the State Council.
26. The immediate packaging materials and containers should be in conformity with the relevant provisions promulgated by the drug regulatory authority of the State Council. The immediate packaging materials and containers must be innocuous, clean, not interact with the drugs being packed, and do not affect the drug quality in the containers.
27. Labelling of drugs must comply with the requirements of “The Drug Administration Law of The People’s Republic of China”, and the provisions for the package and labeling promulgated by the drug regulatory authority of the State Council. The content of the labeling for different packaging should be printed in accord with the above requirement, in which the drug information should be provided as more as possible.
28. A stated mark should be printed on the insert sheet and the labelling of package for narcotics, psychological drugs, toxic drugs for medical use, radioactive drugs, drugs for external use and nonprescription drugs.

MONOGRAPHS

PART I

Acedapsone

$C_{16}H_{16}N_2O_4S$ 332.38

[77-46-3]

Acedapsone is 4,4'-sulfonylbis (acetanilide). It contains not less than 99.0% of $C_{16}H_{16}N_2O_4S$, calculated on the dried basis.

Description A white to slightly yellow crystalline powder; odourless; tasteless. Very slightly soluble in ethanol; practically insoluble in water, ether, dilute hydrochloric acid or sodium hydroxide TS.

Identification (1) To 0.1 g add 5 ml of ethanol and 1 ml of sulfuric acid, mix well, heat, the characteristic odour of ethylacetate is perceptible.

(2) The light absorption of a solution of 5 μ g per ml in dehydrated ethanol exhibits maxima at 256 nm and 284 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of acedapsone (Appendix XVI).

(4) Dissolve 0.1 g in 5 ml of sulfuric acid solution (2→5) by heating, allow it to cool, add 5 ml of water, the solution yields the reaction characteristic of primary aromatic amines (Appendix III).

Dapsone Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-acetone (2 : 1) as the mobile phase. Apply separately to the plate 20 μ l of solution (1) containing 1 mg per ml of the substance being examined in methanol, 5 μ l of solution (2) containing 50 μ g per ml and (3) 200 μ g per ml of dapsone CRS respectively in methanol. After developing and removal of the plate, dry it in air and spray with a 0.5% solution of sodium nitrite in hydrochloric acid solution (0.1 mol/L). Allow it to stand for a few minutes, spray with a 0.1% solution of *n*-(1-naphthyl) ethylenediamine dihydrochloride. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2), and not more than two of secondary spots are intense than the principal spot obtained with solution (3).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.5 g, accurately weighed, in 75 ml of hydrochloric acid solution (1→2) in a conical flask, place a small funnel on the conical flask, heat to boiling and keep boil gently for about 30 minutes, cool. Transfer the solution to a beaker, wash the conical flask with 25 ml of water in portions and add the washings to the beaker. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 16.62 mg of

$C_{16}H_{16}N_2O_4S$.

Category Teprostatic.

Storage Preserve in tightly closed containers.

Preparation Acedapsone Injection

Acedapsone Injection

Acedapsone Injection is a sterile suspension of acedapsone in oil for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of acedapsone ($C_{16}H_{16}N_2O_4S$).

Description A fine granular oily suspension. Allow it to stand, a fine sediment may be produced, which is readily dispersible on shaking.

Identification Shake about 2 ml with 10 ml of chloroform and filter with filter paper moistened with chloroform, wash the residue with 15 ml of chloroform in 3 portions. Dry the residue at 105°C, it complies with tests (1) and (4) for Identification described under Acedapsone.

Particular matter Shake vigorously a quantity of acedapsone injection. Place immediately 1 drop of the suspension on a microscope slide and cover it with a cover glass. Examine the object under a microscope equipped with eyepiece micrometer, shift the slide to examine the uniformity of the particles in the visual fields, no particles larger than 100 μ m in diameter are observed; then examine the object for 4-5 visual fields and count the number of the particles, not less than 90% of the particles are smaller than 15 μ m in diameter and not more than 10% of the particles of 15-20 μ m in diameter (20-100 μ m may be occasionally observed).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Mix well the suspension and measure accurately a quantity equivalent to about 0.3 g of acedapsone, carry out the Assay described under Acedapsone.

Category As described under Acedapsone.

Strength (1) 1.5 ml : 0.225 g (2) 3 ml : 0.45 g
(3) 6 ml : 0.9 g

Storage Preserve in tightly closed containers, protected from light.

Acetazolamide

$C_4H_6N_4O_3S_2$ 222.25

[59-66-5]

Acetazolamide is *N*-[5-(aminosulfonyl)-1,3,4-thiadiazol-2-yl]-acetamide. It contains not less than 98.0% and not more than 102.0% of $C_4H_6N_4O_3S_2$.

Description White needle crystals or a white crystalline powder; odourless; taste, slightly bitter. Sparingly soluble in boiling water; very slightly soluble in water or ethanol; practically insoluble in chloroform or ether; freely soluble in ammonia solution.

Identification (1) Dissolve about 0.1 g by adding sodium hydroxide TS dropwise, add 10 ml of water and 1 drop of phenolphthalein IS. Add dilute hydrochloric acid dropwise until the pink colour disappears and add a few drops of mercuric nitrate TS; a white precipitate is formed.

(2) To 0.2 g in a test tube add 1 ml each of ethanol and sulfuric acid, the odour of ethyl acetate is perceptible on heating.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of acetazolamide (Appendix XVI).

Acidity Shake 1.0 g with 50 ml of hot water and cool, pH 4.0-6.0 (Appendix VI H).

Clarity of alkaline solution A solution of 1.0 g in 5 ml of 10% sodium hydroxide solution is clear.

Chloride Dissolve 2.0 g in 100 ml of water by heating, cool quickly and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of sodium chloride standard solution (0.014%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the filtrate obtained in the test of Chloride. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.04%).

Related Substance Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a freshly prepared mixture of isopropanol-ethyl acetate-13.5 mol/L ammonia solution (50 : 30 : 20) as the mobile phase. Apply separately to the plate 20 µl of each of two solutions of the substance being examined containing (1) 50 mg and (2) 0.05 mg per ml in a mixture of 96% ethanol-ethyl acetate (1 : 1). After developing and removal of the plate, dry it in the air, and examine under ultra violet light (254 nm). Any spot other than principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Reducing substances Impregnate 5.0 g with 5 ml of dehydrated ethanol, add 125 ml of water, 10 ml of nitric acid and 5.0 ml of silver nitrate (0.1 mol/L) VS, shake thoroughly and allow to stand in the dark for 30 minutes. Filter through a sintered glass filter and wash with 10 ml of water. Combine the filtrate and washings, add 5 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS, not less than 4.8 ml of ammonium thiocyanate (0.1 mol/L) VS is required.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 0.50 g; not more than 0.002%.

Assay Dissolve 0.2 g, accurately weighed, in 400 ml of boiling water, cool, transfer to a 1000 ml volumetric flask, dilute with water to volume, and mix well. Measure accurately 5 ml to a 100 ml volumetric flask, add 10 ml of 1 mol/L hydrochloric acid solution, dilute with water to volume and mix well. Measure the absorbance at 265 nm (Appendix IV A), calculate the content of C₄H₆N₄O₃S₂, taking 474 as the value of A (1%, 1 cm).

Category Carbonic anhydrase inhibitor.

Storage Preserve in tightly closed containers, protected

from light.

Preparation Acetazolamide Tablets

Acetazolamide Tablets

Acetazolamide Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of acetazolamide (C₄H₆N₄O₃S₂).

Description White tablets.

Identification (1) To a quantity of the powdered tablets, equivalent to about 0.2 g of acetazolamide, add 3 ml of water and 1 ml of sodium hydroxide TS, stir and filter. To 2 ml of the filtrate add 8 ml of water and mix well. The solution complies with test (1) for Identification described under Acetazolamide.

(2) A quantity of the powdered tablets equivalent to about 50 mg of acetazolamide complies with test (2) for Identification described under Acetazolamide.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 150 ml of acetic acid-sodium acetate BS (pH 4.5) diluted with water to 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution after exactly 45 minutes and filter. Transfer 2 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute with the dissolution medium to volume and mix well. Measure the absorbance at 265 nm (Appendix IV A). Calculate the dissolution of C₄H₆N₄O₃S₂ from each tablet, taking 474 as value of A (1%, 1 cm), not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To a quantity of the powder equivalent to about 0.2 g, accurately weighed, of acetazolamide add 400 ml of boiling water, stir for 15 minutes and cool. Transfer to a 1000 ml volumetric flask, add water to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, add 10 ml of 1 mol/L hydrochloric acid solution, dilute with water to volume and mix well. Measure the absorbance at 265 nm (Appendix IV A). Calculate the content of C₄H₆N₄O₃S₂, taking 474 as the value of A (1%, 1 cm).

Category As described under Acetazolamide.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Acetylcysteine

C₅H₉NO₃S 163.20

[616-91-1]

Acetylcysteine is *N*-acetyl-*L*-cysteine. It contains not less than 98.0% and not more than 102.0% of

$C_5H_9NO_3S$, calculated on the dried basis.

Description A white crystalline powder; odour, characteristic, resembling that of garlic; taste, sour; hygroscopic. Freely soluble in water or ethanol.

Melting range 101-107°C (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 2 ml of 10% sodium hydroxide solution, add 1 ml of lead acetate TS, boil, a yellowish-brown colour is produced gradually and then a black precipitate is formed.

(2) Dissolve about 10 mg in 1 ml of sodium hydroxide TS, add a few drops of sodium nitroprusside TS, mix well, a deep red colour is produced, which turns to yellow with a red ring on standing, and then to red again on shaking.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of acetylcysteine (Appendix XVI).

Acidity Dissolve 1.0 g in 20 ml of water, pH 1.5-2.5 (Appendix VI H).

Clarity of solution A solution of 1.0 g in 10 ml of water is clear.

Loss on drying When dried under reduced pressure over phosphorous pentoxide for 24 hours, loses not more than 3.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 30 ml of water, titrate with iodine (0.05 mol/L) VS rapidly at 20-25°C until the solution turns yellow and persists for not less than 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 16.32 mg of $C_5H_9NO_3S$.

Category Mucolytic agent.

Storage Preserve on tightly closed containers, stored in a dark and cool place.

Preparation Acetylcysteine for inhalation

Acetylcysteine for inhalation

Acetylcysteine for Inhalation contains not less than 95.0% and not more than 105.0% of the labelled amount of acetylcysteine ($C_5H_9NO_3S$), calculated on the basis of average content.

Description A white crystalline powder.

Identification Complies with tests for Identification (1), (2) described under Acetylcysteine.

Acidity, Clarity of solution, Loss on drying Complies with the corresponding requirements described under Acetylcysteine.

Weight variation Complies with the test described under powders for injections (Appendix I B).

Assay Mix the contents obtained from the test for weight variation of contents, carry out the Assay described under Acetylcysteine. Each ml of iodine (0.05 mol/L) VS is equivalent to 16.32 mg of $C_5H_9NO_3S$.

Category As described under Acetylcysteine.

Strength (1) 0.5 g (2) 1 g

Storage Preserve in hermetically sealed containers, stored in a dark and cool place.

Acetylspiramycin

Monoacetylspiramycin II: $R_1 = COCH_3$ $R_2 = H$

Monoacetylspiramycin III: $R_1 = COCH_2CH_3$ $R_2 = H$

Diacetylspiramycin II: $R_1 = COCH_3$ $R_2 = COCH_3$

Diacetylspiramycin III: $R_1 = COCH_2CH_3$ $R_2 = COCH_3$

Acetylspiramycin is a mixture mainly containing monoacetylspiramycin II, monoacetylspiramycin III, diacetylspiramycin II and diacetylspiramycin III. It has a potency of not less than 1200 Acetylspiramycin Units per mg, calculated on the dried basis.

Description A white or slightly yellow powder; taste, bitter. Soluble in methanol, ethanol, acetone or ether; practically insoluble in water; insoluble in petroleum ether.

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using 0.6 g of silica gel G mixed with 2.5 ml of sodium hydroxide (0.1 mol/L) as the coating substance and a mixture of toluene-methanol (9 : 1) as mobile phase, dry the coated glass plate (20 cm × 5 cm) in air and activate at 105°C for 30 minutes. Apply separately to the plate 10 μl each of two solutions in methanol containing (1) 5 mg per ml of the substance being examined and (2) 5 mg per ml of acetylspiramycin CRS respectively. After developing and removal of the plate, dry it in air, visualize with iodine vapor. The colour and position of the four principal spots in the chromatogram obtained with solution (1) correspond to that of the principal spots obtained with solution (2).

(2) The retention times of the four principal peaks of acetylspiramycin in the substance being examined in the chromatogram obtained in the test for Acetylspiramycin components are identical with those of the four principal peaks of acetylspiramycin CRS in the chromatogram of the reference solution correspondingly.

Test (1) or (2) may be used alternative.

Loss on drying When dried to constant weight at 105°C, loses not more than 3.0% of its weight (Appendix VIII L).

Acetylspiramycin components Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.1 mol/L ammonium acetate (60 : 40) with a pH value adjusted to 7.2 ± 0.1 by acetic acid as the mobile phase. Detection wavelength is 232 nm. The number of the theoretical plates of the column is not less than

1000, calculated with reference to the peak of monoacetylspiramycin III. The resolution factor between the peaks of monoacetylspiramycin III and diacetylspiramycin II complies with the related requirements.

Procedure Dissolve an accurately weighed quantity in mobile phase to produce a solution of 1 mg per ml, mix well and filter. Inject 10 μ l of the successive filtrate into the column and record the chromatogram. The retention times of the four principal peaks are in this order: monoacetylspiramycin II, monoacetylspiramycin III, diacetylspiramycin II, and diacetylspiramycin III. Calculate the content of monoacetylspiramycin (II + III) and diacetylspiramycin (II + III) as follows. Either the content of monoacetylspiramycin (II + III) or that of diacetylspiramycin (II + III) is not less than 35%.

$$\begin{aligned} \text{Monoacetylspiramycin (II + III)} \\ &= \frac{A_{\text{mono II}} + A_{\text{mono III}}}{A_{\text{mono II}} + A_{\text{mono III}} + A_{\text{di II}} + A_{\text{di III}}} \times 100\% \\ \text{Diacetylspiramycin (II + III)} \\ &= \frac{A_{\text{di II}} + A_{\text{di III}}}{A_{\text{mono II}} + A_{\text{mono III}} + A_{\text{di II}} + A_{\text{di III}}} \times 100\% \end{aligned}$$

Where $A_{\text{mono II}}$ is the peak area of monoacetylspiramycin II; $A_{\text{mono III}}$ is the peak area of monoacetylspiramycin III; $A_{\text{di II}}$ is the peak area of diacetylspiramycin II; $A_{\text{di III}}$ is the peak area of diacetylspiramycin III.

Repeat the operation, using acetylspiramycin CRS instead of the substance being examined. Calculate the sum content of the four main contents by the external standard method, not less than 75%.

The sum content of the four main components

$$= \frac{A_T W_S P}{A_S W_T} \times 100\%$$

Where A_T is the sum area of the four peaks of the substance being examined; A_S is the sum area of the four peaks of acetylspiramycin CRS; W_S is the weight of the substance being examined; W_T is the weight of acetylspiramycin CRS; P is the sum area of the four peaks of acetylspiramycin CRS.

Assay Dissolve an accurately weighed quantity in ethanol (using 2 ml of ethanol for 5 mg), dilute with sterile water to produce a solution of 1000 Units per ml. Carry out the microbiological assay of antibiotics (Appendix XI A).

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry, cool and dark place.

Preparation (1) Acetylspiramycin Capsules
(2) Acetylspiramycin Tablets

Acetylspiramycin Capsules

Acetylspiramycin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of acetylspiramycin.

Description Capsules containing almost white to slightly yellow powder or granules.

Identification A quantity of the content of the capsule complies with the tests for Identification described under Acetylspiramycin Tablets.

Loss on drying When dried to constant weight at 105°C, loses not more than 4.0% of its weight (Appendix VIII L).

Acetylspiramycin components Dissolve an accurately weighted quantity of the contents of the capsules in mobile phase to produce a solution of 1 mg per ml, mix well and filter, carry out the test for Acetylspiramycin components described under Acetylspiramycin. Either the content of monoacetylspiramycin (II + III) or that of diacetylspiramycin (II + III) is not less than 35%, the sum content of the four principal components is not less than 70%, calculated by the following formula.

The sum content of the four main contents

$$\begin{aligned} &A_T W_S \times \text{average weight} \times P \times \\ &= \frac{\text{Potency of Acetylspiramycin CRS}}{A_S W_T \times \text{labelled amount}} \times 100\% \end{aligned}$$

Where A_T is the sum area of the four peaks of the substance being examined;

A_S is the sum area of the four peaks of the acetylspiramycin CRS;

W_S is the weight of the substance being examined;

W_T is the weight of the acetylspiramycin CRS;

P is the sum area of the four peaks of the acetylspiramycin CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using hydrochloride acid solution (24 ml of dilute hydrochloride acid solution \rightarrow 1000 ml) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the above hydrochloride acid solution to produce a solution of 20 μ g per ml. Dissolve an accurately weighted quantity of the mixed contents in the test for weight variation of contents equivalent to about the average weight of one capsule in ethanol, using 2 ml of ethanol for 5 mg and dilute with the above solvent to produce a solution of 100 μ g per ml and filter, dilute an accurately weighted quantity of the successive filtrate with hydrochloride acid solution to produce a solution of 20 μ g per ml. Measure the absorbance of the resulting solutions at 232 nm (Appendix IV A), calculate the dissolution of acetylspiramycin from each capsule. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighted quantity of the mixed contents in the test for weight variation of contents (equivalent to about 0.1 g of acetylspiramycin) in ethanol (using 2 ml of ethanol for 5 mg), dilute with sterile water to produce a solution of 1000 Units per ml, mix well and allow to stand. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under Acetylspiramycin (Appendix VI A).

Category As described under Acetylspiramycin.

Strength (1) 0.1 g (100000 units)
(2) 0.2 g (200000 units)

Storage Preserve in tightly closed containers, stored in a dry, cool and dark place.

Acetylspiramycin Tablets

Acetylspiramycin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of acetylspiramycin.

Description Sugar coated or film coated tablets with almost white or slightly yellow core.

Identification Carry out the following test, using a quantity of the powdered and coating-removed tablets.

(1) To a quantity equivalent to about 0.1 g of acetylspiramycin add 10 ml of methanol, shake thoroughly to dissolve acetylspiramycin and filter. Dilute 1 ml of the successive filtrate with methanol solution (1→5) to produce a solution of 20 µg per ml. The light absorption of the resulting solution exhibits a maximum at 232 nm (Appendix IV A).

(2) The retention times of the four principal peaks of acetylspiramycin in the substance being examined in the chromatogram obtained in the test for Acetylspiramycin components are identical with those of the four principal peaks of acetylspiramycin CRS in the chromatogram of the reference solution correspondingly.

(3) Dissolve a quantity in methanol to produce a solution of 5 mg of acetylspiramycin per ml and filter, using the successive filtrate as solution (1). Dissolve a quantity of acet is iram cin CRS in methanol to produce a solution of 5 mg per ml as solution (2). Measure the equal volume of the two solutions and mix well as solution (3). Apply separately to the plate 10 µl of each of the three solutions. Carry out the test (1) for identification described under Acetylspiramycin. There are four principal spots obtained with solution (3), and the colour and position of the spots correspond to the principal spots obtained with solution (2) or solution (3).

(2) or (3) may be used alternative.

Acetylspiramycin components Dissolve an accurately weighted quantity of the powdered tablets in mobile phase to produce a solution of 1 mg per ml, mix well and filter, carry out the test for Acetylspiramycin components described under Acetylspiramycin. Either the content of monoacetylspiramycin (II + III) or that of diacetylspiramycin (II + III) are not less than 35%, the sum content of the four main component is not less than 70%, calculated by the following formula.

$$\frac{A_T W_S \times \text{average weight} \times P \times \text{Potency of Acetylspiramycin CRS}}{A_S W_T \times \text{labelled amount}} \times 100\%$$

Where A_T is the sum area of the four peaks of the substance being examined;

A_S is the sum area of the four peaks of the acetylspiramycin CRS;

W_S is the weight of the substance being examined;

W_T is the weight of the acetylspiramycin CRS;

P is the sum area of the four peaks of the acetylspiramycin CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloride acid solution (24 ml of dilute hydrochloride acid solution→1000 ml) as the dissolution medium, adjust the rotational speed of the paddle to 100 r/min. Withdraw the solution after exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 20 µg per ml. Dissolve an accurately weighed quantity of the mixed contents in the test for weight variation of contents equivalent to about the average weight of one tablet in ethanol using 2 ml of ethanol for 5 mg, dilute with the dissolution medium to produce a solution of 100 µg per ml and filter. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 20 µg per ml. Measure the absorbance of the resulting solutions at 232 nm (Appendix IV A), calculate the dissolution of acetylspiramycin from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A)

Assay Weigh accurately and triturate 10 tablets or 5 tablets for the sugar coated tablets, accurately weighed a quantity (equivalent to about 0.1 g of acetylspiramycin) in ethanol (using 2 ml of ethanol for 5 mg), dilute with sterile water to produce a solution of 1000 Units per ml, mix well and allow to stand. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under Acetylspiramycin.

Category As described under Acetylspiramycin.

Strength (1) 0.1 g (10 000 units)

(2) 0.2 g (20 000 units)

Storage Preserve in tightly closed containers, stored in a dry, cool and dark place.

Aciclovir

$C_8H_{11}N_5O_3$ 225.21

[59277-89-3]

Aciclovir is 2-amino-9-[(2-hydroxyethoxy) methyl]-1,9-dihydro-6H-purin-6-one. It contains not less than 98.0% of $C_8H_{11}N_5O_3$, calculated on the dried basis.

Description A white crystalline powder; odourless; tasteless. Sparingly soluble in glacial acetic acid or hot water; very slightly soluble in water; practically insoluble in chloroform or ether; soluble in dilute sodium hydroxide solution.

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in water at 252 nm (Appendix IV A), the value of A (1%, 1 cm) is 603-641.

Identification (1) The retention time of principal peak of aciclovir in the chromatogram obtained in the Assay is identical with the principal peak of aciclovir CRS in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of aciclovir (Appendix XVI).

Clarity and colour of solution Triturate and dissolve 0.5 g in 10 ml of 1% sodium hydroxide solution, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B); any colour produced is not more intense than that of reference solution Y_2 (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-concentrate ammonia solution (80 : 20 : 2) as the mobile phase. Apply to the plate 5 µl of the solution containing 10 mg of the substance being examined per ml in dimethyl sulfoxide. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm), no spot other than the principle spot in the chromatogram is observed.

Guanine Dissolve about 50 mg, accurately weighed, in 5 ml of 0.4% sodium hydroxide solution in a 50 ml volumetric flask, dilute with water to volume and mix well, measure accurately 10 ml to a 50 ml volumetric flask, dilute with water to volume and mix well as a test solution. Dissolve 10

mg of guanine CRS, accurately weighed, in 0.4% sodium hydroxide solution in a 100 ml volumetric flask, dilute to volume and mix well as guanine stock reference solution, measure accurately 2 ml to a 100 ml volumetric flask, dilute with water to volume and mix well as guanine reference solution. Carry out the method described under Assay. Inject separately 20 μ l each of the test solution and guanine reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The peak area of guanine in the chromatogram obtained with the test solution is not greater than that of guanine in the chromatogram obtained with the guanine reference solution (1.0%).

Loss on drying When dried to constant weight at 105°C, loses not more than 6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (10 : 90) as the mobile phase. Detection wavelength is 254 nm. Add 1 ml of guanine stock reference solution under Guanine to 5 ml of aciclovir reference solution and mix well. Inject 20 μ l of the resulting solution into the column and record the chromatogram. The resolution factor between peaks of aciclovir and guanine complies with the related requirements.

Procedure Dissolve about 50 mg, accurately weighed, in 5 ml of 0.4% sodium hydroxide solution in a 50 ml volumetric flask, dilute with water to volume and mix well, measure accurately 2 ml to a 100 ml volumetric flask, dilute with water to volume and mix well as test solution. Inject 20 μ l of the test solution into the column, and record the chromatogram. Repeat the operation, using aciclovir CRS instead of the substance being examined to produce the aciclovir reference solution of 20 μ g per ml. Calculate the content of $C_8H_{11}N_5O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antiviral.

Storage Preserve in tightly closed containers, protected from light.

Preparation

- (1) Aciclovir Capsules
- (2) Aciclovir chewable Tablets
- (3) Aciclovir Cream
- (4) Aciclovir Eye Drops
- (5) Aciclovir for Injection
- (6) Aciclovir Granules
- (7) Aciclovir Tablets

Aciclovir Capsules

Aciclovir Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of aciclovir ($C_8H_{11}N_5O_3$).

Description Capsules containing white to almost white powder.

Identification Comply with the tests (1), (2) for Identification described under Aciclovir Tablets.

Guanine The successive filtrate obtained under the Assay as

test solution complies with Guanine described under Aciclovir.

Dissolution Carry out the dissolution test (Appendix X C method 1), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with 0.1 mol/L hydrochloric acid solution to produce a solution containing about 10 μ g per ml. Measure the absorbance of the solution at 254 nm (Appendix IV A) immediately. Measure the absorbance of a solution containing 10 μ g of aciclovir CRS per ml in the same manner. Calculate the dissolution of $C_8H_{11}N_5O_3$ from each capsules. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for Capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents, equivalent to about 50 mg of aciclovir, obtained in the test for weight variation. Carry out the Assay described under Aciclovir Tablets, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength 0.2 g

Storage Preserve in tightly closed containers.

Aciclovir Chewable Tablets

Aciclovir Chewable Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of aciclovir ($C_8H_{11}N_5O_3$).

Description White or almost white tablets; taste, sweet.

Identification Comply with the tests (1), (2) for Identification described under Aciclovir Tablets.

Guanine Carry out the method as described under Aciclovir. The successive filtrate obtained under the Assay as test solution complies with Guanine described under Aciclovir.

Other requirements Comply with the general requirements for tablets (Appendix I A), except Disintegration.

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 50 mg of aciclovir. Carry out the Assay described under Aciclovir Tablets, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength 0.4 g

Storage Preserve in tightly closed containers, stored in a dry place.

Aciclovir Cream

Aciclovir Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of aciclovir ($C_8H_{11}N_5O_3$).

Description A white cream.

Identification (1) Complies with the test (1) for Identification described under Aciclovir Eye Drops, using 50 ml of the successive filtrate obtained under the Assay as test solution.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak obtained in the chromatogram of the reference solution.

Guanine The successive filtrate obtained under the Assay as test solution complies with Guanine described under Aciclovir.

Other requirements Complies with the general requirements for Cream (Appendix I F).

Assay Weigh accurately a quantity of the cream, equivalent to about 50 mg of acyclovir, into a beaker, add 5 ml of 0.4% sodium hydroxide solution, shake thoroughly for 1 minutes in a hot water bath, add 5 g of sodium chloride with stirring, transfer to 250 ml volumetric flask with a quantity of hot water and shake for 10 minutes in a hot water bath, cool to room temperature, dilute with water to volume, mix well and filter. Dilute a quantity of the successive filtrate, accurately measured, with water to produce a solution containing about 20 µg per ml as test solution. Carry out the Assay described under Aciclovir, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength 10 g : 0.3 g

Storage Preserve in tightly closed containers, stored in a dry, cool and dark place.

Aciclovir Eye Drops

Aciclovir Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of aciclovir ($C_8H_{11}N_5O_3$).

Description A clear, colourless liquid.

Identification (1) Evaporate 20 ml to dryness over a water bath. To the residue add 2 ml of hydrochloric acid and evaporate to dryness. Add 1 ml of hydrochloric acid and about 30 mg of potassium chlorate, evaporate to dryness, to the residue add ammonia TS dropwise, a violet-red colour is produced, add a few drops of sodium hydroxide TS again, the violet-red colour disappears.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak obtained in the chromatogram of the reference solution.

pH value 7.5-9.0 (Appendix VI H).

Guanine Dilute an accurately measured quantity with water to produce a solution containing 200 µg of aciclovir per ml as test solution. The solution complies with Guanine described under Aciclovir.

Other requirements Comply with the general requirements for Ophthalmic preparations (Appendix I G).

Assay Dilute an accurately measured quantity with water to produce a solution containing 20 µg of aciclovir per ml. Carry out the Assay described under Aciclovir, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength 8 ml : 8 mg

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Aciclovir for Injection

Aciclovir for Injection is a sterile lyophilized product with sodium hydroxide solution. It contains not less than 90.0% and not more than 110.0% of the labelled amount of aciclovir ($C_8H_{11}N_5O_3$), calculated on the basis of the average contents.

Description A white, loose agglomerates or powder.

Identification (1) To about 20 mg add 2 ml of hydrochloric acid and evaporate to dryness over a water bath. Add 1 ml of hydrochloric acid and about 30 mg of potassium chlorate, evaporate to dryness in the same manner, to the residue add ammonia TS dropwise, a violet-red colour is produced, add a few drops of sodium hydroxide TS, the violet-red colour disappears.

(2) To a quantity of the contents, equivalent to about 10 mg of acyclovir, add 10 ml of water, shake to dissolve acyclovir, add a few drops of ammoniated silver nitrate TS; a curdy, white precipitate is formed.

(3) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak obtained in the chromatogram of the reference solution.

(4) Yields the flame reaction of sodium salts (Appendix III). Carry out the identification (1) (3) (4) or (2) (3) (4)

Alkalinity Dissolve the content of 1 container in 20 ml of water and mix well, pH 10.5-11.5 (Appendix VI H).

Clarity of solution Dissolve the content of 1 container in 5 ml of water, the solution is clear; any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B).

Guanine Weigh accurately a quantity of the mixed contents, equivalent to about 50 mg of acyclovir, obtained in the test for weight variation into a 250 ml volumetric flask, dissolve and dilute with water to volume, mix well, use the resulting solution as test solution. The solution complies with Guanine described under Aciclovir.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 16 mg per ml in Water for Injections per kg of rabbit's weight.

Other requirements Complies with the general requirements for Injection (Appendix I B).

Assay Weigh accurately a quantity of the mixed contents, equivalent to about 50 mg of acyclovir, obtained in the test for weight variation into a 250 ml volumetric flask, dissolve and dilute with water to volume, shake thoroughly, dilute an accurately measured quantity with water to produce a solution containing 20 µg of aciclovir per ml. Carry out the Assay described under Aciclovir, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength 0.25 g

Storage Preserve in well closed containers, protected from light.

Aciclovir Granules

Aciclovir Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of

aciclovir ($C_8H_{11}N_5O_3$).

Description White to almost white granules; taste, slightly sweet.

Identification Comply with the tests (1), (2) for Identification described under Aciclovir Tablets.

Loss on drying When dries to constant weight at 105°C , loses not more than 6.0% of its weight (Appendix VIII L).

Guanine The successive filtrate obtained under the Assay as test solution complies with Guanine described under Aciclovir.

Other requirements Comply with the general requirements for Granules (Appendix I N).

Assay Weigh accurately a quantity of the powdered and mixed contents, equivalent to about 50 mg of acyclovir, obtained in the test for weight variation. Carry out the Assay described under Aciclovir Tablets, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength 0.2 g

Storage Preserve in tightly closed containers.

Aciclovir Tablets

Aciclovir Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of aciclovir ($C_8H_{11}N_5O_3$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets, equivalent to about 10 mg of the acyclovir, add 10 ml of water, shake thoroughly and filter. To the filtrate add a few drops of ammoniated silver nitrate TS; a curdy, white precipitate is formed.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak obtained in the chromatogram of the reference solution.

Guanine The successive filtrate obtained under the Assay as test solution complies with Guanine described under Aciclovir.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with 0.1 mol/L hydrochloric acid solution to produce a solution containing about $10\text{ }\mu\text{g}$ per ml. Measure the absorbance of the solution at 254 nm (Appendix IV A) immediately. Measure the absorbance of a solution containing $10\text{ }\mu\text{g}$ of aciclovir CRS per ml in the same solution. Calculate the dissolution of $C_8H_{11}N_5O_3$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder, equivalent to about 50 mg of acyclovir into a 250 ml volumetric flask, add 5 ml of 0.4% sodium hydroxide solution and sonicate for 1 minute, add a quantity of water and shake for 10 minutes in a hot water bath, cool to room temperature, dilute with water to volume, mix well and filter. Dilute a quantity of the

successive filtrate, accurately measured, with water to produce a solution containing about $20\text{ }\mu\text{g}$ per ml. Carry out the Assay described under Aciclovir, calculate the content of $C_8H_{11}N_5O_3$.

Category As described under Aciclovir.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers.

Adenosine Disodium Triphosphate

$C_{10}H_{14}N_5Na_2O_{13}P_3 \cdot 3H_2O$ 605.19 [987-65-5]

Adenosine disodium triphosphate is adenosine-5'-triphosphate disodium salt trihydrate. It contains not less than 95.0% of $C_{10}H_{14}N_5Na_2O_{13}P_3$, calculated on the anhydrous basis.

Description A white or almost white powder or crystals; odourless; taste, salty; hygroscopic. Freely soluble in water, practically insoluble in ethanol, chloroform, or ether.

Identification (1) Dissolve 20 mg in 2 ml of dilute nitric acid, add 1 ml of ammonium molybdate TS, heat, cool, a yellow turbidity is formed.

(2) To 3 ml of its aqueous solution ($3 \rightarrow 10000$), add 0.2 ml of 3,5-dihydroxy-methylbenzene ethanol solution ($1 \rightarrow 10$) and 3 ml of ammonium ferric sulfate solution ($1 \rightarrow 1000$), heat for 10 minutes in a water bath, a green colour is produced.

(3) The infrared absorption spectrum is concordant with the reference spectrum of adenosine disodium triphosphate (Appendix XVI).

(4) Yields the flame reaction characteristic of sodium salts (Appendix III).

Acidity Dissolve 0.5 g in 10 ml of water, pH 2.5-3.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.15 g in 10 ml of water is clear and colourless; any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Related substance Carry out the method as described under Weight ratio of adenosine disodium triphosphate of Assay, calculate as follows: not more than 5.0%.

$$\text{Related substance (\%)} = \frac{0.671T_1 + 0.855T_2 + T_x}{0.671T_1 + 0.855T_2 + T_3 + T_x} \times 100\%$$

Water 6.0%-12.0% (Appendix VIII M, A of method 1), dissolving an accurately weighed quantity in ethylene glycol-dehydrated methanol (60 : 40).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference solution using 5 ml of sodium chloride standard solution (0.05%).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate buffer (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), slowly injecting 1 ml of a solution of 2 mg per ml in Water for Injection per kg of rabbit's weight.

Assay

Total nucleotide Dissolve an accurately weighed quantity in 0.1 mol/L phosphate BS (to 35.8 g of disodium hydrogen phosphate, add water to 1000 ml, as solution A; to 13.6 g of dehydrated potassium dihydrogen phosphate, add water to 1000 ml, as solution B; adjust solution A to pH 7.0 with solution B) to produce a solution of 20 µg per ml, measure the absorbance at 259 nm (Appendix IV A). Calculate the content of $C_{10}H_{14}N_5Na_2O_{13}P_3$, taking 279 as the value of A (1%, 1 cm).

Weight ratio of adenosine disodium triphosphate Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and 0.2 mol/L phosphate BS (Dissolve 35.8 g of disodium hydrogen phosphate and 13.6 g of potassium dihydrogen phosphate in 900 ml of water, adjust to pH 7.0 with 1 mol/L sodium hydroxide solution, add 1.61 g of tetrabutylammonium bromide, add water to 1000 ml and mix well)-methanol (95 : 5) as the mobile phase. Maintain the column temperature at 35°C. Detection wavelength is 259 nm and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of adenosine disodium triphosphate. The elution order is adenosine sodium monophosphate, adenosine disodium diphosphate and adenosine disodium triphosphate. The resolution factor among peaks complies with related requirements.

Procedure Dissolve an accurately weighed quantity in mobile phase to produce a solution of 4 mg per ml. Inject 10 µl of the resulting solution into the column, calculate the weight ratio of adenosine disodium triphosphate to the total nucleotide as follows.

$$\text{Weight ratio of adenosine disodium triphosphate} = \frac{T_3}{0.671T_1 + 0.855T_2 + T_3 + T_x}$$

Where T_1 is peak area of adenosine sodium monophosphate
 T_2 is peak area of adenosine disodium diphosphate
 T_3 is peak area of adenosine disodium triphosphate
 T_x is area of the other peaks

0.671 is the molecular weight ratio of adenosine sodium monophosphate to adenosine disodium triphosphate

0.855 is the molecular weight ratio of adenosine disodium diphosphate to adenosine disodium triphosphate

Content of adenosine disodium triphosphate Calculate as follows.

$$\text{Content of adenosine disodium triphosphate (\%)} = \frac{\text{Total nucleotide} \times \text{Weight ratio of adenosine disodium triphosphate}}{\text{Total nucleotide}}$$

Category Medicines for improving cell metabolism.

Storage Preserve in tightly closed containers, stored in a cool, dark and dry place.

Preparation (1) Adenosine disodium triphosphate injection
 (2) Adenosine disodium triphosphate for injection

Adenosine Disodium Triphosphate for Injection

Adenosine disodium triphosphate for injection is a sterile lyophilized powder. It contains not less than 90.0% of the labelled amount of adenosine disodium triphosphate ($C_{10}H_{14}N_5Na_2O_{13}P_3$).

Description White lyophilized pieces or powder; hygroscopic; freely soluble in water.

Identification Complies with tests (1) and (2) for Identification described under Adenosine Disodium Triphosphate.

Acidity A solution of 10 mg per ml in water, pH 4.5-7.0 (Appendix VI H).

Clarity and colour of solution A solution of 10 mg per ml in water is clear and colourless.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 100°C, loses not more than 5.0% of its weight (Appendix VIII L).

Pyrogens Complies with the test for Pyrogen described under Adenosine Disodium Triphosphate.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the method for Assay under Adenosine Disodium Triphosphate.

Category As described under Adenosine Disodium Triphosphate.

Strength 20 mg

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Adenosine Disodium Triphosphate Injection

Adenosine disodium triphosphate injection is a sterile solution of adenosine disodium triphosphate in Water for Injection. It contains not less than 90.0% of the labelled amount of adenosine disodium triphosphate ($C_{10}H_{14}N_5Na_2O_{13}P_3$).

Description A clear, colourless or almost colourless liquid.

Identification Complies with tests (1) and (2) for Identification described under Adenosine Disodium Triphosphate.

pH value pH 8.0-9.5 (Appendix VI H).

Colour of solution Not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Pyrogens Complies with the test for Pyrogen described under Adenosine Disodium Triphosphate.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the method for Assay under Adenosine Disodium Triphosphate.

Category As described under Adenosine Disodium Triphosphate.

Strength 2 ml : 20 mg

Storage Preserve in well tightly containers, stored in a cool and dark place.

Adipiodone

$C_{20}H_{14}I_6N_2O_6$ 1139.76

[606-17-7]

Adipiodone is 3,3'-[(1,6-dioxo-1,6-hexanediyl) diimino] bis [2,4,6-triiodo] benzoic acid. It contains not less than 98.0% of $C_{20}H_{14}I_6N_2O_6$, calculated on the dried basis.

Description A white powder; odourless; taste, slightly bitter.

Slightly soluble in ethanol; partially in alcohol, ether, chloroform or ether; soluble in sodium hydroxide solutions.

Identification (1) Heat gently about 10 mg in a crucible, the purple iodine vapour is evolved by decomposition. (2) Add separately a 0.08% methanolic sodium hydroxide solution to the substance being examined and adipiodone CRS to produce solutions of 1 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and *n*-butanol-glacial acetic acid-water (4 : 1 : 5) as the mobile phase. Apply separately 10 µl each of the two solutions to the plate. Examine under an ultraviolet light (254 nm) after developing. The position of the principal spots in the chromatogram obtained with the two solutions are identical.

Clarity and colour of alkaline solution A solution of 2.0 g in 10 ml of sodium hydroxide TS is clear. Any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B) and any colour produced is not more intense than that of reference solution Y₂ or BR₂ (Appendix IX A, method 1).

Free iodine To 5 ml of the alkaline solution obtained in Clarity and colour of solution add water to produce 10 ml. Carry out the method described under Diatrizoic Acid, the result complies with the requirements.

Halide Dissolve 2.0 g in 4 ml of sodium hydroxide TS, add a mixture of 4 ml of dilute nitric acid and 30 ml of water, shake for a few minutes to precipitate adipiodone, filter. Wash the precipitate with a small amount of water. Combine the washings with filtrate and make up to 50 ml, shake well, refilter if necessary. Carry out the limit test for chlorides (Appendix VIII A), using 20 ml of filtrate. Any opalescence produced is not more pronounced than that of a reference, using 8.0 ml of sodium chloride standard solution (0.01%).

Amino-compound Dissolve 1.0 g in 5 ml of water and 5 ml of sodium hydroxide TS, add water to produce 100 ml. To 10 ml add 5 ml of sodium nitrite (0.1 mol/L) VS and 10 ml of hydrochloric acid solution (9→100), mix well and allow to stand for 10 minutes. Add 5 ml of 2.5% ammonium sulfamate solution, shake and allow to stand for 5 minutes. Add 2 ml of alkaline β-naphthol TS, 15 ml of sodium hydroxide TS and water to produce 50 ml, mix well. Measure the absorbance of the resulting solution at 485 nm (Appendix IV B); not greater than 0.34.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals Not more than 0.002% (Appendix VIII H, method 2), Using 1.0 g.

Iodide, Residue on ignition, Iron Carry out the corresponding tests described under Diatrizoic Acid and meet the requirement.

Assay Weigh accurately about 0.3 g, carry out the Assay described under Diatrizoic Acid. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 19.00 mg of $C_{20}H_{14}I_6N_2O_6$.

Category Diagnostic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Meglumine Adipiodone Injection

Adrenaline

(Epinephrine)

$C_9H_{13}NO_3$ 183.21

[51-43-4]

Adrenaline is (*R*)-4-[2-(methylamino) 1-hydroxyethyl]-1, 2-benzenediol. It contains not less than 98.5% of $C_9H_{13}NO_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter. Deteriorated on exposure to air or light; unstable in neutral or alkaline water solution; saturated aqueous solution exhibits a weak alkaline reaction. Very slightly soluble in water; insoluble in ethanol, chloroform, ether, fatty oils or volatile oils; freely soluble in solutions of mineral acids or sodium hydroxide solution; insoluble in ammonia or sodium carbonate solution.

Melting range 206-212°C, with decomposition (Appendix VI C).

Specific optical rotation -50.0° to -53.5°, in a solution of 20 mg per ml in hydrochloric acid solution (9→200) (Appendix VI E).

Identification (1) Dissolve about 2 mg in 2-3 drops of hydrochloric acid solution (9→1000), add 2 ml of water and 1 drop of ferric chloride TS; an emerald-green colour is produced, which changes firstly to violet and then to reddishviolet on the addition of 1 drop of ammonia TS. (2) Dissolve about 10 mg in 2 ml of hydrochloric acid solution (9→1000), add 10 drops of hydrogen peroxide TS and boil; a blood red colour is produced.

Clarity and colour of acid solution The solution obtained in the determination of Specific optical rotation is clear; any colour produced is not more intense than that of a reference solution prepared by adding 5 ml of water to 5 ml of reference solution Y₃ or OR₂ (Appendix IX A, method 1).

Phenones Measure the absorbance of a 2.0 mg per ml solution in hydrochloric acid solution (9→2000) at 310 nm (Appendix IV A); not greater than 0.05.

Loss on drying When dried in vacuum over phosphorus pentoxide for 18 hours, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, and titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.32 mg of $C_9H_{13}NO_3$.

Category Adrenergic receptor stimulant.

Storage Preserve in hermetically sealed containers in vacuum, protected from light and stored in a cool place.

Preparation Adrenaline Hydrochloride Injection

Adrenaline Hydrochloride Injection

(Epinephrine Hydrochloride Injection)

Adrenaline Hydrochloride Injection is an isotonic sterile solution of adrenaline in Water for Injection containing a quantity of hydrochloric acid and sodium chloride. It contains not less than 85.0% and not more than 115.0% of the labelled amount of adrenaline ($C_9H_{13}NO_3$). It may contain suitable stabilizers.

Description A clear, colourless or almost colourless solution; deteriorated on exposure to air or light.

Identification To 2 ml add 1 drop of ferric chloride TS, an emerald-green colour is produced, it changes first to violet and then to reddish-violet on the addition of 1 drop of ammonia TS.

pH value 2.5–5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.14% sodium heptyl-sulfonate solution and methanol (65 : 35) and adjusting to pH 3.0 ± 0.1 with phosphoric acid as the mobile phase. Detection wavelength is 280 nm. The number of theoretical plates of the column is not less than 3000.

Procedure Dilute an accurately measured amount of the injection equivalent to 3 mg of adrenaline in a 25 ml volumetric flask, add acetic acid solution (1 → 25) to volume, mix well, inject 20 μ l into the column, record the peak areas correspondingly obtained in the chromatogram. Dissolve a quantity of adrenaline CRS, accurately weighed, in acetic acid solution (1 → 25) to produce a solution of 0.12 mg per ml. Repeat the operation, Calculate the content of $C_9H_{13}NO_3$ with respect to the peak area obtained in the chromatogram by external standard method.

Category As described under Adrenaline.

Strength (1) 0.5 ml : 0.5 mg (2) 1 ml : 1 mg

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Alanine

$C_3H_7NO_2$ 89.09

Alanine is L-2-aminopropanoic acid. It contains not less than 98.5% of $C_3H_7NO_2$, calculated on the dried basis.

Description White crystals or crystalline powder; odour; taste, sweet.

Specific optical rotation $+14.0^\circ$ to $+15.0^\circ$, in a solution of about 50 mg per ml in 1 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix

IV C) is concordant with the reference spectrum of Alanine (Appendix XVI).

Acidity Dissolve 1.0 g in 20 ml of water, pH is 5.5–7.0 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-water-acetic acid (5 : 2 : 1) as the mobile phase. Apply to the plate 5 μ l of a solution of 20 mg of the substance being examined per ml in water. After developing and removal of the plate, dry it in air and dry at 90°C for 10 minutes and spray with ninhydrin solution (dissolve 1 g ninhydrin in 50 ml of acetone) and heat at 90°C until the colour is produced. There is only one purple spot in the chromatogram.

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.02 EU per mg (for parenteral administration).

Assay Dissolve about 80 mg, accurately weighed, in 2 ml of dehydrated formic acid, add 30 ml of glacial acetic acid.

^y
V A), titrate with ^pperchloric acid (0.1 mol/L) ^{pp}VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 8.909 mg of $C_3H_7NO_2$.

Category Amino acid.

Storage Preserve in tightly closed containers.

Alarelin Acetate

5-oxoPro-His-Trp-Ser-Tyr-D-Ala-Leu-Arg-Pro-NHCH₂CH₃, CH₃COOH

$C_{56}H_{78}N_{16}O_{12} \cdot n C_2H_4O_2$ 1227.39

Alarelin acetate is 5-oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-D-alanyl-L-leucyl-L-arginyl-L-prolyl-ethylamine acetate. It contains not less than 95.0% and not more than 103.0% of $C_{56}H_{78}N_{16}O_{12}$, calculated with reference to the anhydrous, acetic acid-free substance.

Description A white or almost white powder; odourless; hygroscopic.

Soluble in water; sparingly soluble in methanol; soluble in 1% acetic acid solution.

Specific optical rotation -46° to -56° , calculated with reference to the anhydrous and acetic acid-free substance, in a solution of 5 mg per ml in 1% acetic acid solution (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 0.1 mg per ml in water at 279 nm (Appendix IV A), the value of A (1%, 1 cm) is 52-57, calculated with reference to the anhydrous, acetic acid-free substance.

Identification (1) The retention time of the principal peak of alarelin acetate in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of alarelin acetate CRS in the chromatogram of the reference solution.

(2) Dilute the substance being examined and alarelin acetate CRS separately with water to produce test solution and reference solution both containing about 2 mg per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-glacial acetic acid-water (60 : 45 : 6 : 14) as the mobile phase. Apply separately to the plate 2 μ l of each of above two solutions, after developing and removal of the plate, dry it in air, leave it in contact with the chlorine vapour (add to a beaker, which is in a well closed container, 10 ml of 5% potassium permanganate solution and 3ml of hydrochloric acid). Dry it in air again. Spray with potassium iodide starch IS. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with reference solution.

Clarity and colour of solution Dissolve 20 mg in 2 ml of water, the solution is clear and colourless; any colour produced is not more intense than that of reference solution Y_2 (Appendix IX A).

Acetic acid Dissolve a quantity of the substance being examined, accurately weighed, in the diluent (a mixture of 95 volumes of mobile phase A and 5 volumes of mobile phase B) to produce a solution of about 10 mg per ml as test solution. Dissolve a quantity of glacial acetic acid, accurately weighed, in the diluent to produce a reference solution of about 0.60 mg per ml. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel, phosphoric acid solution (dilute 0.7 ml of phosphoric acid to 1000 ml with water; adjust to pH 3.0 with sodium hydroxide TS) as mobile phase A, and methanol as mobile phase B and performing the gradient elution program. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of acetic acid.

Time (min)	Mobile phase A (percent V/V)	Mobile phase B (percent V/V)
0	95	5
5	50	50
20	50	50
25	95	5

Inject separately 20 μ l of each of the reference solution and the test solution into the column, record the chromatogram. Calculate the content of acetic acid with respect to the peak area obtained in the chromatogram by the external standard method; not more than 7.5%.

Amino acids Add a quantity of 6 mol/L hydrochloric acid solution to the substance being examined. After hydrolyzing by heating at 110°C for 24 hours, examine by means of an amino-acid analyzer or suitable high performance liquid chromatography. Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking the number of moles of alanine as equal to one. The values fall within the following limits: serine 0.7 to 1.0; glutamic acid 0.9 to 1.1; proline 0.8 to 1.0; leucine 0.9 to 1.1; tyrosine 0.9 to 1.1; histidine 0.9 to 1.1; arginine 0.9 to 1.1.

Related substance Dissolve a quantity of the substance being examined in water to produce a solution of 0.5 mg per ml as the test solution. Transfer 1 ml of the test solution, measured accurately, into a 100 ml volumetric flask, dilute with water to volume, mix well, and use this solution as the reference solution. Carry out the method as described under the Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 50% of the scale of the chart. Inject separately 20 μ l of each of the reference solution and the test solution into the column, and record the chromatogram for twice the retention time of the principal peak. The area of any peak other than the peaks of solvent and the principal peak in the chromatogram obtained with the test solution is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the areas of all peaks other than the peaks of solvent and the principal peak in the chromatogram obtained with the test solution are not greater than five times the area of principal peak in the chromatogram obtained with the reference solution (Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution).

Water Not more than 7.0% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L phosphoric acid solution (adjust to pH 3.0 with triethylamine)-acetonitrile (80 : 20) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of alarelin acetate.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of about 0.5 mg per ml, mix well. Inject 10 μ l into the column. Repeat the operation, using alarelin acetate CRS instead of the substance being examined. Calculate the content of $C_{56}H_{78}N_{16}O_{12}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Gonadotrophin-releasing hormone.

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Preparation Alarelin acetate for injection

Alarelin Acetate for Injection

Alarelin acetate for injection is a sterile, freeze-dried preparation of alarelin acetate with mannitol. It contains

not less than 90.0% and not more than 110.0% of the labelled amount of alarelin ($C_{56}H_{78}N_{16}O_{12}$).

Description A white, friable mass or powder.

Identification The retention time of the principal peak of alarelin acetate in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of alarelin acetate CRS in the chromatogram of the reference solution.

Acidity Add 2 ml of water separately to each of 5 containers, mix together, pH 4.5 to 7.0 (Appendix VI H).

Content uniformity Complies with the requirements for content uniformity (Appendix X E), using the individual results obtained in the Assay.

Sterility Complies with the requirements for sterility (Appendix XI H, membrane filtration method), dilute the substance being examined with sodium chloride injection.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of each of 10 containers in water to produce a solution of 0.1 mg per ml as test solution. Dissolve a quantity of alarelin acetate CRS, accurately weighed, in water to produce a solution of 0.1 mg per ml as reference solution. Carry out the method described under Assay in alarelin acetate. Calculate the content of $C_{56}H_{78}N_{16}O_{12}$ from the average of the 10 individual results.

Category As described under Alarelin acetate.

Strength (1) 25 μg (2) 150 μg

Storage Preserve in well closed containers and protected from light.

Albendazole

$C_{12}H_{15}N_3O_2S$ 265.34

[54965-21-9]

Albendazole is [5-(propylthio)-1*H*-benzimidazol-2-yl] carbamic acid methyl ester. It contains not less than 98.5% of $C_{12}H_{15}N_3O_2S$, calculated on the dried basis.

Description A white or almost white powder; odourless; tasteless.

Slightly soluble in acetone or chloroform; practically insoluble in ethanol; insoluble in water; soluble in glacial acetic acid.

Melting range 206–212°C, with decomposition (Appendix VI C).

Specific Absorbance Dissolve about 10 mg, accurately weighed, in 5 ml of glacial acetic acid in a 100 ml volumetric flask. Dilute with ethanol to volume, mix well. Transfer 5 ml, accurately measured, to a 50 ml volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbance at 295 nm. The value of *A* (1%, 1 cm) is 430–458 (Appendix IV A).

Identification (1) Ignite about 0.1 g, fumes are evolved which stain lead acetate TP black.

(2) Dissolve about 0.1 g in warm dilute sulfuric acid, add potassium iodobismuthate TS, a reddish-brown precipitate is

produced.

(3) The light absorption of the solution obtained in the measurement of specific absorbance exhibits a maximum at 295 nm, a minimum at 277 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of albendazole (Appendix XVI). If the absorption peak at 1380 cm^{-1} is not concordant with the reference spectrum, dissolve a quantity of the substance in dehydrated ethanol, evaporate to dryness on a water bath and dry in vacuum. Record the infrared absorption spectrum of the dried substance.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-ether-glacial acetic acid (30 : 7 : 3) as the mobile phase. Apply separately to the plate 5 μl each of two solutions of the substance being examined in chloroform-glacial acetic acid (9 : 1) containing (1) 5.0 mg per ml, (2) 75 μg per ml. After developing and removal of the plate, dry it in the air and examine under an ultra-violet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Iron To the residue obtained in the test for Residue on ignition add 2 ml of hydrochloric acid, evaporate to dryness on a water bath. Dissolve the residue in 4 ml of dilute hydrochloric acid by warming, add 30 ml of water and 50 mg of ammonium persulfate. Carry out the limit test for iron (Appendix VIII G), the colour produced is not more intense than that produced by treating 3.0 ml of standard iron solution in the same manner (0.0030%).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.53 mg of $C_{12}H_{15}N_3O_2S$.

Category Anthelmintic.

Storage Preserve in tightly closed containers.

Preparation (1) Albendazole Capsules
(2) Albendazole Granules
(3) Albendazole Tablets

Albendazole Capsules

Albendazole Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of albendazole ($C_{12}H_{15}N_3O_2S$).

Identification (1) A quantity of the contents of the capsules equivalent to about 0.2 g of albendazole, complies with tests (1) and (2) for Identification described under Albendazole. (2) The light absorption of the solution obtained in the Assay exhibits maximum at 295 nm and a minimum at 277 nm (Appendix IV A).

Other requirements Comply with the general requirements for capsules (Appendix I E), except that the disintegration test is not required.

Assay To a quantity of the mixed contents obtained in the

test for weight variation of content equivalent to about 20 mg of albendazole, accurately weighed, in a 100 ml volumetric flask, add 10 ml of glacial acetic acid, shake thoroughly. Dilute with ethanol to volume, mix well, filter if necessary, and discard the initial filtrate. Transfer 5 ml of the successive filtrate, accurately measured to another 100 ml volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A). Calculate the content of $C_{12}H_{15}N_3O_2S$, taking 444 as the value of A (1%, 1 cm).

Category As described under Albendazole.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers.

Albendazole Granules

Albendazole Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of albendazole ($C_{12}H_{15}N_3O_2S$).

Description Granules with colour; odour, fragrant.

Identification (1) Dissolve a quantity of powdered granules, equivalent to about 0.2 g of albendazole, in 30 ml of ethanol by warming on a water bath. Filter and evaporate the filtrate to dryness on a water bath. The residue complies with test (2) for Identification described under Albendazole. (3) The light absorption of the solution obtained in the Assay exhibits a maximum at 295 nm and a minimum at 277 nm (Appendix IV A).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve an accurately weighed quantity of powdered granules equivalent to about 20 mg of albendazole in 100 ml volumetric flask with 10 ml of glacial acetic acid, shake well. Dilute to volume with ethanol, mix well and filter. Transfer accurately measured 5 ml of the successive filtrate into 100 ml volumetric flask. Dilute to volume with ethanol, mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A), calculate the content of $C_{12}H_{15}N_3O_2S$, taking 444 as the value of A (1%, 1 cm).

Category As described under Albendazole.

Strength (1) 1 g : 0.1 g (2) 1 g : 0.2 g

Storage Preserve in tightly closed containers, stored in a dry place.

Albendazole Tablets

Albendazole Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of albendazole ($C_{12}H_{15}N_3O_2S$).

Description Almost white tablets, sugar coated tablets or film coated tablets, with white or almost white core.

Identification (1) Dissolve a quantity of powdered tablets, equivalent to about 0.2 g of albendazole, in 30 ml of ethanol by warming on a water bath. Filter and evaporate the filtrate on a water bath to dryness. The residue complies with tests (1) and (2) for Identification described under Albendazole. (2) The light absorption of the solution obtained in the Assay exhibits a maximum at 295 nm and a minimum at 277 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with 0.1 mol/L sodium hydroxide solution to produce a solution of 10 µg per ml as the test solution. Dissolve about 20 mg of albendazole CRS, accurately weighed, into 100 ml volumetric flask with 5 ml of 2% methanolic hydrochloric acid solution, shake well. Dilute to volume with 0.1 mol/L hydrochloric acid solution, mix well. Measure accurately 5 ml into a 100 ml volumetric flask, dilute to volume with 0.1 mol/L sodium hydroxide solution and mix well, as the reference solution. Measure the absorbance at 308 nm (Appendix IV A). Calculate the dissolution of $C_{12}H_{15}N_3O_2S$ from each tablet. Not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with sugar coating removed if the tablets are sugar coated. To a quantity of the powder equivalent to about 20 mg of albendazole, accurately weighed, in a 100 ml volumetric flask, add 10 ml of glacial acetic acid, shake thoroughly. Dilute with ethanol to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate and transfer to another 100 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the resulting solution at 295 nm (Appendix IV A), calculate the content of $C_{12}H_{15}N_3O_2S$, taking 444 as the value of A (1%, 1 cm).

Category As described under Albendazole.

Strength (1) 0.1 g (2) 0.2 g (3) 0.4 g

Storage Preserve in tightly closed containers.

Albumin Aggregated and Stannous Chloride for Injection

Albumin Aggregated and Stannous Chloride for Injection is a sterile, nonpyrogen and lyophilized preparation of stannous chloride and heat denatured human serum albumin. It contains not less than 85.0% and not more than 110.0% of the labelled amount of human serum albumin.

Description A white lyophilized powder, white particle suspension is produced in water or Sodium Chloride Injection, the particles aggregate at the bottom of the bottle after standing.

Identification (1) Dissolve the content of 1 bottle in 1 ml of water, mix well, add 1 drop of ninhydrin TS and heat, a violet blue is produced.

(2) Dissolve the content of 1 bottle in a quantity of water, add 1 drop of ammonium phosphomolybolic acid TS, a light blue colour is produced gradually, which changes dark blue after heating.

Acidity and alkalinity Suspend the content of 1 bottle in 5 ml of Sodium Chloride Injection, pH 5.0-7.5 (Appendix VI H).

Particle size Dilute the content of 1 bottle in a quantity of Sodium Chloride Injection to produce a suspension of about 1000 particles per ml, shake thoroughly to disperse the particles, immediately withdraw a drop with a pipette on a blood cell counting chamber, examine under a microscope.

Examining not less than 100 particles, particles from 10 μm up to 90 μm in maximum dimension are not less 90% and no particle of larger than 150 μm is observed.

Stannous To each of the content of 5 bottles, add 3 ml of 1 mol/L hydrochloric acid solution saturated with nitrogen respectively. Carry out the method for potentiometric titration (Appendix VII A), titrate with potassium iodate (0.001667 mol/L) VS under nitrogen current. Not less than 0.02 ml of potassium iodate (0.001667 mol/L) VS is consumed for per bottle. Repeat the test with 5 additional bottles if 1 bottle fails, All of the bottles should comply with the requirements.

Bacterial endotoxin Mix the content of 1 bottles with 5 ml of water-BET. Carry out the test for bacterial endotoxin (Appendix XI E); not more than 75 Eu per bottle.

Other requirements Complies with the general requirements for Injection (Appendix I B).

Assay Transfer the contents of 2 bottles with 4 ml of Sodium Chloride Injection to a centrifuging in portions, centrifuge, discard the supernatant liquid, wash the precipitation with 4 ml of Sodium Chloride Injection. Centrifuge and discard the supernatant liquid, add 2 ml of Sodium Chloride Injection, shake well as a test solution. Transfer 2 ml of human serum albumin solution (2 mg per ml) to another centrifuging as a reference solution. Transfer 2 ml of sodium chloride solution, measure accurately, to a third centrifuging as a blank solution. To each of the three solutions, add accurately 4 ml of alkaline cupric tartaric acid solution (Dissolve 1.5 g cupric sulfate and 6.0 g of sodium potassium tartrate in 500 ml of water in a 1000 ml volumetric flask, add 300 ml of 10% sodium hydroxide solution free from carbonate, mix well, and dilute with water to volume) respectively, mix well, heat in a 50-60°C water bath for 30 minutes. Measure the absorbance at 540 nm (Appendix IV B), and calculate the content of human serum albumin.

Category For preparation of Technetium [$^{99\text{m}}\text{Tc}$] Albumin Aggregated injection.

Strength 2 mg of human serum albumin and 0.15 mg of stannous chloride ($\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$).

Storage Preserve in tightly closed containers, stored in a temperature between 2°C to 8°C in a dark place.

Alfacalcidol

$\text{C}_{27}\text{H}_{44}\text{O}_2$ 400.65

[41294-56-8]

Alfacalcidol is 9,10-Secosteroid-5,7,10 (19)-triene-1 α , 3 β -diol. It contains not less than 97.5% and not more than 102.0% of $\text{C}_{27}\text{H}_{44}\text{O}_2$.

Description A white, crystalline powder; odourless; tasteless, deteriorated on exposure to light, moisture or heat. Freely soluble in ethanol or dichloromethane; soluble in

ether; practically insoluble in water.

Melting range 137-142°C, with decomposition (Appendix VI C).

Specific optical rotation +46° to +52°, in a solution of 1.25 mg per ml in anhydrous ethanol (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μg per ml in anhydrous ethanol at 265 nm (Appendix IV A), the value of A (1%, 1 cm) is 420-447.

Identification (1) Dissolve about 0.02 mg with 0.2 ml of chloroform, add 3 drops of acetic acid and 1 drop of sulfuric acid, shake; a yellow colour is produced which turns to red immediately and to yellow-green gradually.

(2) The retention time of the principal peak of the substance being examined in the chromatogram of the Assay corresponds to that of the reference substance.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of alfacalcidol CRS.

Related substances Dissolve a quantity of the substance being examined in mobile phase to produce a solution of 0.1 mg per ml (solution 1) and 1 μg per ml (solution 2). Carry out the method as described under Assay. Inject 20 μl of the solution 2 into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10% of the full scale of the chart. Inject separately 20 μl of solution 1 and solution 2 into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the area of all peaks other than the principal peak in the chromatogram with solution 1 is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution 2.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with silica gel and a mixture of ethyl acetate-petroleum ether (60-90°C)-chloroform (42 : 44 : 14) as the mobile phase. Detection wavelength is 265 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of alfacalcidol. The resolution factor between the peaks of alfacalcidol and internal standard is not less than 3.5.

Internal standard solution Dissolve about 15 mg of diazepam in mobile phase in a 50 ml volumetric flask, dilute to volume, shake well; and dilute 2 ml of the solution with mobile phase to volume in a 100 ml volumetric flask, shake well.

Procedure Dissolve a quantity of the substance being examined with mobile phase to produce a solution of 10 μg per ml as a test solution; transfer 5 ml each of the test solution and the internal standard solution, both measured accurately, in a 50 ml volumetric flask, dilute with mobile phase to volume, mix well. Inject 20 μl of the resulting solution into the column. And then dissolve a quantity of alfacalcidol CRS, accurately weighed, repeat the operation, calculate the content of $\text{C}_{27}\text{H}_{44}\text{O}_2$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Calcium metabolism regulator.

Storage Preserve in tightly closed containers filled with nitrogen, stored in a cold place and protected from light.

Preparation Alfacalcidol Tablets.

Alfacalcidol Tablets

Alfacalcidol Tablets contain not less than 85.0% and not more than 115.0% of the labelled amount

of alfacalcidol ($C_{27}H_{44}O_2$).

Description White tablets.

Identification The retention time of the principal peak of the substance being examined in the chromatogram of the Assay corresponds to that of the reference substance.

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 tablet to a stoppered centrifugal tube and powder. Add 1 ml of the internal standard solution (2) described under the Assay, measure accurately, stopper, treat vortically and ultrasonically for 4 minutes alternately, centrifuge in high speed. The supernatant is used as the test solution. Carry out the method described under the Assay and calculate the content of alfacalcidol. The limit of content uniformity is $\pm 25\%$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with silica gel and a mixture of ethyl acetate-petroleum ether (60-90°C)-chloroform (42 : 44 : 14) as the mobile phase. Detection wavelength is 265 nm, and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of alfacalcidol. The resolution factor between the peaks of alfacalcidol and internal standard is not less than 1.5.

Internal standard solution Dissolve about 15 mg of diazepam in mobile phase in a 50 ml volumetric flask, dilute to volume, shake well; and measure accurately 2 ml of the solution to a 100 ml volumetric flask, dilute with mobile phase to volume, shake well as internal standard solution (1). Measure accurately 5 ml of the internal standard solution (1) to a 100 ml volumetric flask, dilute with a mixture of mobile phase-dichloromethane (1 : 1) to volume, shake well as internal standard solution (2).

Procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity, equivalent to about 1 μg of alfacalcidol, to a stoppered centrifugal tube, add 2 ml of the internal standard solution (2), treat vortically and ultrasonically for 4 minutes alternately, centrifuge in high speed. Inject 20 μl of the supernatant into the column. Dissolve a quantity of alfacalcidol CRS with mobile phase to produce a solution of 10 μg per ml; transfer 5 ml each of the solution and the internal standard solution (1), both measured accurately, in a 100 ml of volumetric flask, dilute with mobile phase to volume, mix well. And then repeat the operation, calculate the content of $C_{27}H_{44}O_2$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Alfacalcidol.

Strength (1) 0.25 μg (2) 0.5 μg

Storage Preserve in tightly closed containers, stored in a dry, cool and dark place and protected from light.

Allopurinol

$C_5H_4N_4O$ 136.11

[315-30-0]

Allopurinol is 1*H*-pyrazolo [3,4-*d*] pyrimidin-4-ol. It contains not less than 97.0% and not more than 102.0% of $C_5H_4N_4O$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless.

Very slightly soluble in ethanol or water; insoluble in chloroform or ether; freely soluble in sodium hydroxide or potassium hydroxide solution.

Identification (1) To about 50 mg add 5 ml of 5% sodium hydroxide solution and 1 ml of alkali potassium mercuric iodide TS, heat to boil, a yellow precipitate is formed on standing.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 250 nm and a minimum at 231 nm. The ratio of the absorbance at 231 nm to that at 250 nm is 0.52-0.60 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of allopurinol (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using microcrystalline cellulose powder (F_{254}) as the coating substance and *n*-butanol saturated with ammonia TS as the mobile phase. Apply separately to the plate 5 μl each of two solutions in 10% diethylamine solution containing (1) 50 mg per ml, (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry it in the air, examine under ultra-violet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Weigh accurately about 20 mg and dissolve in 10 ml of 0.4% sodium hydroxide solution with warming, if necessary. Add hydrochloric acid solution (9→1000) to produce a solution of 10 μg per ml. Measure the absorbance at 250 nm (Appendix IV A), calculate the content of $C_5H_4N_4O$, taking 571 as the value of *A* (1%, 1 cm).

Category Gout suppressant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Allopurinol Tablets

Allopurinol Tablets

Allopurinol Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of allopurinol ($C_5H_4N_4O$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.1 g of allopurinol add 10 ml of 5% sodium hydroxide solution, shake to dissolve allopurinol, filter. The filtrate complies with test (1) for Identification describe 'r A''-p r' ol.

(2) The solution obtained in Assay complies with test (2) for Identification described under Allopurinol.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 100 r/min. Withdraw 10 ml of the solution

after exactly 45 minutes and filter. Dilute 5 ml of successive filtrate, accurately measured, with hydrochloric acid solution (9 → 1000) to 50 ml, mix well. Measure the absorbance at 250 nm (Appendix IV A), calculate the dissolution of $C_5H_4N_4O$ from each tablet, taking 571 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powdered tablets equivalent to about 0.1 g of allopurinol, accurately weighed, in a 100 ml volumetric flask add 20 ml of 0.2% sodium hydroxide solution, shake for 15 minutes to dissolve allopurinol, add water to volume and mix well. Filter, transfer 5 ml of the successive filtrate, accurately measured, to a 500 ml volumetric flask, add hydrochloric acid solution (9 → 1000) to volume and mix well. Measure the absorbance at 250 nm (Appendix IV A). Calculate the content of $C_5H_4N_4O$, taking 571 as the value of A (1%, 1 cm).

Category As described under Allopurinol.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Almitrine Bismesylate

Almitrine Bismesylate is bis-2,4-allylamino-6-[4-bis-(4-fluorophenyl) methyl]-1-piperazinyl-S-triazine bismesylate. It contains not less than 98.0% and not more than 102.0% of $C_{26}H_{29}F_2N_7 \cdot 2CH_3SO_3H$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless. Freely soluble in methanol, chloroform; soluble in ethanol; slightly soluble in acetone; insoluble in water.

Identification (1) Transfer about 0.2 g to a test tube, a gas is evolved by gentle heating, which turns wet lead acetate TP black.

(2) The light absorption of a solution of 8 µg per ml in ethanol exhibits a maximum at 223 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of almitrine bismesylate (Appendix XVI).

Acidity Dissolve 0.50 g in 50 ml of water, shake for 10 minutes and filter, the successive filtrate is as the test solution, pH 2.0-3.5 (Appendix VI H)

Fluorine Weigh accurately about 35 mg and carry out the limit test for Fluorine (Appendix VIII E). The fluorine content is not less than 5.1% and not more than 6.3%.

Related substances Carry out the method for thin-layer chromatography (Appendix V B) using silica gel GF₂₅₄ as the coating substance and the supernatant liquid of a mixture of *n*-Hexane-dichloromethane-ether-concentrated ammonia solution (38 : 25 : 12 : 10) as mobile phase. Apply separately to the plate 5 µl each of four solutions in methanol containing (1) 20 mg per ml, (2) 0.10 mg per ml, (3) 0.20 mg per ml, (4) 0.40 mg per ml of substance being examined. After developing and removal of the plate, dry it in air and expose it to iodine vapour until the spots appear. The number of spots in the chromatogram other than the principal spot obtained with solution (1) is not more than 3. The intensity of any secondary spot in the chromatogram obtained with solution (1) is compared with that of the principal spots obtained with solution (2), (3), (4), the total impurity is not more than 2.0%.

Toluene Dissolve a quantity, accurately weighed, in dimethyl-sulfoxide to produce a solution of 20 mg per ml and complies with the determination of residual solvents (Appendix VIII P).

Chloride Dissolve about 0.50 g in 25 ml of ethanol and carry out the limit test for chloride (Appendix VIII A) except diluting with ethanol. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.01%).

Sulfate Dissolve about 0.50 g in 50 ml of water, boil gently for 2 minutes, cool, add water to original volume, mix well and filter. Carry out the limit test for sulfate (Appendix VIII B), using 40 ml of the successive filtrate. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.05%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.15% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85 : 15) (add 5 µl of diethylamine per 1000 ml) as the mobile phase. Detection wavelength is 222 nm and the number of theoretical plates of the column is not less than 900, calculated with reference to the peak of almitrine bismesylate.

Procedure Dissolve a quantity, accurately weighed, in the mobile phase to produce the solution of 0.12 mg per ml. Inject 20 µl of the resulting solution, accurately measured, into the column and record the peak areas corresponding obtained in the chromatogram. Weigh accurately almitrine bismesylate CRS and repeat the operation. Calculate the content of $C_{26}H_{29}F_2N_7 \cdot 2CH_3SO_3H$.

Category Central stimulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Compound Almitrine Tablets

Alprazolam

$C_{17}H_{13}ClN_4$ 308.77

[28981-97-7]

Alprazolam is 8-chloro-1-methyl-6-phenyl-4*H*-s-triazolo [4,3- α] [1,4] benzodiazepine. It contains not less than 98.0% of $C_{17}H_{13}ClN_4$, calculated on the dried basis.

Description A white or almost white crystalline powder. Freely soluble in chloroform; sparingly soluble in ethanol or acetone; practically insoluble in water or ether.

Identification (1) Dissolve about 5 mg in 2 ml of hydrochloric acid solution (9→1000), divide to two portions. Add 1 drop of silicotungstic acid TS in one portion, a white precipitate is formed. Add 1 drop of potassium iodobismuthate TS in another portion, an orange red precipitate is produced.

(2) The light absorption of a solution of 12 μ g per ml in hydrochloric acid solution (9→1000) exhibits a maximum at 264 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Alprazolam (Appendix XVI).

Chloride To 0.50 g add 50 ml of water, shake for 10 minutes and filter. Carry out the limit test for chloride (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Related substance Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol (9 : 1) as the mobile phase. Apply separately to the plate 10 μ l of each of two solutions of the substance being examined in ethanol containing (1) 10 mg per ml, (2) 0.1 mg per ml. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any spot, other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of acetic anhydride, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to yellowish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 15.44 mg of $C_{17}H_{13}ClN_4$.

Category Hypnotic, sedative.

Storage Preserve in tightly closed containers, protected from light.

Preparation Alprazolam Tablets

Alprazolam Tablets

Alprazolam Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of alprazolam ($C_{17}H_{13}ClN_4$).

Description White tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 2 mg of alprazolam add 3 ml of hydrochloric acid solution (9→1000), shake thoroughly and filter. The filtrate complies with the test (1) for Identification described under Alprazolam.

(2) The light absorption of a solution obtained in the Assay exhibits a maximum at 264 nm (Appendix IV A).

Content uniformity Comply with the requirements (Appendix X E). Dissolve 1 tablet with a quantity of hydrochloric acid solution (9→1000) and transfer to a 50 ml volumetric flask, shake well, dilute with hydrochloric acid solution (9→1000) to volume, shake and filter. Measure the absorbance of the successive filtrate, proceed as described under Assay, calculate the content of $C_{17}H_{13}ClN_4$, taking 407 as the value of A (1%, 1 cm).

Dissolution Carry out the dissolution test (Appendix XC, method 1), using 500 ml of phosphate BS (dissolve 16 g of potassium dihydrogen phosphate and 4 g of dipotassium hydrogen phosphate in water, dilute to 2000 ml with water, adjust the pH value to 6.0 ± 0.1 with phosphoric acid) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of solution after exactly 30 minutes and filter, using the successive filtrate as the test solution. Carry out the method for high performance liquid chromatography (Appendix VD), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS-acetonitrile-tetrahydrofuran (60 : 35 : 5) as the mobile phase. Detection wavelength is 254 nm. Inject 100 μ l of the successive filtrate into the column, accurately measured, record the chromatogram. Dissolve a quantity of alprazolam CRS, accurately measured, in methanol to produce a solution of 16 μ g per ml. Transfer 5 ml of the solution into a 100 ml volumetric flask, accurately measured, dilute with the phosphate BS to volume and mix well, repeat the operation. Calculate the dissolution of $C_{17}H_{13}ClN_4$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets. To an accurately weighed quantity of powder (equivalent to about 3 mg of alprazolam) in a 50 ml volumetric flask, add a quantity of hydrochloric acid solution (9→1000), shake thoroughly, dilute with hydrochloric acid solution (9→1000) to volume, mix well and filter. Measure accurately 10 ml of the successive filtrate to another 50 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Measure the absorbance of the resulting solution at 264 nm (Appendix IV A), calculate the content of $C_{17}H_{13}ClN_4$, taking 407 as the value of A (1%, 1 cm).

Category As described under Alprazolam.

Strength 0.4 mg

Storage Preserve in tightly closed containers, protected from light.

Alprostadil

$C_{20}H_{34}O_5$ 354.48

[745-65-3]

Alprostadil is 11 α , 15(S)-dihydroxy-9-oxoprost-13-en-1-oic acid. It contains not less than 95.0% and not more than 105.0% of $C_{20}H_{34}O_5$, calculated on the dried basis.

Description White acicular crystals or a crystalline powder. Freely soluble in ethanol; slightly soluble in water; soluble in phosphate BS (pH 7.4-8.0).

Melting point 113-118°C (Appendix VI C).

Specific optical rotation -60° to -70° , in a solution of 10 mg per ml in ethanol (Appendix VI E).

Identification (1) The retention time of principal peak of alprostadil in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of alprostadil CRS in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of alprostadil (Appendix XVI).

Related substance Dissolve a quantity of the substance being examined in the mobile phase to produce a solution of 1 mg per ml as the test solution. Transfer 5 ml of the test solution, measured accurately, into a 100 ml volumetric flask, dilute with the mobile phase to volume, mix well. Use this solution as the reference solution. Carry out the method as described under Assay. Inject 10 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10%-15% of full scale of the chart. Inject separately 10 μ l each of the test solution and the reference solution into the column, and record the chromatogram for three times the retention time of the principal peak. The area of the peak of prostaglandin A_1 in the chromatogram obtained with test solution is divided by 7.28, the sum of the result and the areas of all peaks other than the principal peak are not greater than that of the principal peak in the chromatogram obtained with reference solution (5.0%).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.02 mol/L potassium dihydrogen phosphate solution (pH 4.9) (40 : 60) as the mobile phase. Detection wavelength is 214 nm. To 2.0 ml of alprostadil CRS solution obtained in the Procedure, add 1 drop of 0.1 mol/L sodium hydroxide solution, mix well and allow to stand for 1 hour. Inject 10 μ l of the resulting solution into the column. The resolution factor between the peaks of Alprostadil and prostaglandin A_1 complies with the requirements (The relative retention time of the peak of prostaglandin A_1 is about 2.2-2.7).

Procedure Transfer about 10 mg, accurately weighed, into a 50 ml volumetric flask, dilute with mobile phase to volume, and mix well. Inject 10 μ l into the column, record the peak area obtained in the chromatogram. Repeat the operation, using alprostadil CRS instead of the substance being examined. Calculate the content of $C_{20}H_{34}O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Medicine for prostaglandin.

Storage Preserve in tightly closed containers, stored in a cold place.

Preparation Alprostadil for Injection

Alprostadil for Injection

Alprostadil for injection is a sterile, freeze-dried preparation of alprostadil. It contains not less than 85.0% and not more than 120.0% of the labelled amount of alprostadil ($C_{20}H_{34}O_5$).

Description A white friable mass or powder

Identification The retention time of the principal peak of alprostadil in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of alprostadil CRS in the chromatogram of the reference solution.

Related substance Dissolve a quantity of the substance being examined in 25% ethanol solution to produce a solution of 0.1 mg of alprostadil per ml as the test solution. Transfer 5 ml of the test solution, measured accurately, into a 50 ml volumetric flask, dilute with 25% ethanol solution to volume, mix well. Use this solution as the reference solution and carry out the test described under Alprostadil. The area of the peak of prostaglandin A_1 in the chromatogram obtained with test solution is divided by 7.28, the result is not greater than that of the principal peak in the chromatogram obtained with reference solution (10.0%).

Content uniformity Complies with the requirements for content uniformity except the limit is $\pm 20\%$ (Appendix X E). Carry out the method described under the Assay, using the contents of one container.

Undue toxicity Complies with the test for Undue toxicity (Appendix XI C), using a solution of 0.1 mg per ml in a sodium chloride injection, injected intravenously.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): not more than 0.25 EU per μ g of alprostadil.

Sterility Complies with the test for sterility (Appendix XI H), using a solution by dissolving a quantity of the substance being examined in a sodium chloride injection.

Other requirements Complies with the general requirements for the injections (Appendix I B).

Assay Dissolve a quantity of the substance being examined in 25% ethanol solution to produce a solution of 0.1 mg of alprostadil per ml as the test solution. Carry out the Assay described under Alprostadil and calculate the content of $C_{20}H_{34}O_5$.

Category As described under alprostadil.

Strength (1) 20 μ g (2) 30 μ g (3) 80 μ g (4) 100 μ g (5) 200 μ g

Storage Preserve in tightly closed containers, protected

from light and stored in a cool place.

Altretamine

$C_9H_{18}N_6$ 210.28

[645-05-6]

Altretamine is 2,4,6-Tri-(dimethylamino)-1,3,5-triazine. It contains not less than 98.5% of $C_9H_{18}N_6$, calculated on the dried basis.

Description A white crystalline powder; odourless; sublimate, it may sublime.

Freely soluble in chloroform; sparingly soluble in ethanol; insoluble in water; freely soluble in dilute hydrochloric acid.

Melting range 170-174°C (Appendix VI C).

Identification (1) Dissolve 15 mg in 5 ml of 0.14% iodine petroleum ether solution, the colour of solution changes from purple to red.

(2) The light absorption of a solution of 2 µg per ml in ethanol exhibits a maximum at 227 nm (Appendix IV A).

(3) The infrared absorption spectrum of this substance or its sublimate are concordant with the spectrum of altretamine (Appendix XVI).

Chlorinated compound Weigh accurately 0.1 g, carry out the method for oxygen flask combustion (Appendix VII C), using 2 ml of sodium hydroxide TS and 10 ml of water as the absorbing liquid, when the combustion is completed, shake the flask vigorously to complete the absorption, add 10 ml of dilute nitric acid and transfer to a 50 ml nessler cylinder, carry out the limit test for chloride (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 2 ml of sodium chloride standard solution (0.01%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in each 10 ml of glacial acetic acid and acetic anhydride, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.03 mg of $C_9H_{18}N_6$.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Altretamine Capsules
(2) Altretamine Tablets

Altretamine Capsules

Altretamine capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of altretamine ($C_9H_{18}N_6$).

Identification To a quantity of the contents of capsules equivalent to about 0.1 g of Altretamine add a quantity of chloroform, filter and evaporate the filtrate to dryness on a water bath. The residue complies with test (1) and (2) for Identification described under Altretamine.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (0.9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Measure accurately 2 ml of the successive filtrate to a 25 ml volumetric flask (strength 50 mg), to a 50 ml volumetric flask (strength 100 mg) or to a 100 ml volumetric flask (strength 200 mg), dilute with the same dissolution medium to volume and mix well. Dissolve an accurately weighed quantity of altretamine CRS in the dissolution medium to produce a solution of 4.4 µg per ml. Measure the absorbance of the resulting solutions at 241 nm (Appendix IV A), calculate the dissolution of $C_9H_{18}N_6$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of mixed contents obtained in the test for weight variation of contents equivalent to about 0.15 g of Altretamine, and carry out the Assay described under Altretamine.

Category As described under Altretamine.

Strength (1) 50 mg (2) 100 mg (3) 200 mg

Storage Preserve in tightly closed containers, protected from light.

Altretamine Tablets

Altretamine tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of altretamine ($C_9H_{18}N_6$).

Description White tablets.

Identification To a quantity of powdered tablets equivalent to about 0.1 g of altretamine add a quantity of chloroform, shake thoroughly, filter and evaporate the filtrate to dryness on a water bath. The residue complies with test (1) and (2) for Identification described under Altretamine.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (0.9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Measure accurately 2 ml of the successive filtrate to a 25 ml volumetric flask (strength 50 mg) or to a 50 ml volumetric flask (strength 100 mg), dilute with the same dissolution medium to volume and mix well. Dissolve an accurately weighed quantity of altretamine CRS in the dissolution medium to produce a solution of 4.4 µg per ml. Measure the absorbance of the resulting solutions at 241 nm (Appendix IV A), calculate the dissolution of $C_9H_{18}N_6$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 0.15 g of altretamine, and carry out the Assay described under Altretamine.

Category As described under Altretamine.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Aluminium Hydroxide

Aluminium Hydroxide contains not less than 48.0% of Al_2O_3 .

Description A white powder, odourless and tasteless. Insoluble in water or ethanol; soluble in dilute mineral acids and sodium hydroxide solution.

Identification Heat and dissolve about 0.5 g in 10 ml of dilute hydrochloric acid, the solution yields the reactions characteristic of aluminium salts (Appendix III).

Neutralizing capacity To about 0.12 g, accurately weighed, in a 250 ml conical flask with stopper add 50 ml of hydrochloric acid (0.1 mol/L) VS, accurately measured, stopper the flask and shake for 1 hour continuously at 37°C. Allow the solution to cool, add 6-8 drops of bromophenol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS. The volume of hydrochloric acid (0.1 mol/L) VS consumed is not less than 230 ml for each g of the substance being examined.

Alkali carbonate Mix 0.20 g with 10 ml of freshly boiled and cooled water and filter. To the filtrate add 2 drops of phenolphthalein IS. If the solution is pink, add 0.10 ml of hydrochloric acid (0.1 mol/L) VS, the pink colour disappears.

Chloride Boil and dissolve 0.10 g in 6 ml of dilute nitric acid, allow to cool, dilute to 20 ml with water and filter. Carry out the limit test for chlorides (Appendix VIII A), using 5 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.2%).

Sulfate Boil and dissolve 0.10 g in 3 ml of dilute hydrochloric acid, allow to cool, dilute to 50 ml with water and filter. Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of potassium sulfate standard solution (0.1%).

Heavy metals To 1.0 g add 5 ml of hydrochloric acid, evaporate to dryness on a water bath. Add 5 ml of water, stir thoroughly, continue to evaporate towards dryness, stir to produce a dry powder. Dissolve it in 2 ml of acetate BS (pH 3.5) and 10 ml of water by gently heat, filter. To the filtrate add a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.003%.

Arsenic Boil 0.20 g in 10 ml of dilute sulfuric acid, allow to cool, add 5 ml of hydrochloric acid and a quantity of water to produce 28 ml. Complies with the limit test for arsenic (Appendix VIII J, method 1) (0.001%).

Assay Dissolve by heat about 0.6 g, accurately weighed, in 10 ml each of hydrochloric acid and water, cool to room temperature and filter. Transfer the filtrate to a 250 ml volumetric flask, wash the filter with water, combine the washings to the flask, dilute with water to volume and mix well. Measure accurately 25 ml of the resulting solution, neutralize with ammonia TS until the precipitate is just dissolved, add 10 ml of ammonium acetate BS (pH 6.0) and then 25 ml of disodium edetate (0.05 mol/L) VS, accurately measured. Boil the solution for 3-5 minutes, cool

to room temperature, add 1 ml of xylene orange IS, titrate with zinc (0.05 mol/L) VS until the solution changes from yellow to red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.549 mg of Al_2O_3 .

Category Antacid.

Storage Preserve in tightly closed containers.

Preparation (1) Aluminium Hydroxide Gel
(2) Aluminium Hydroxide Tablets
(3) Compound Aluminium Hydroxide Tablets

Aluminium Hydroxide Gel

Aluminium Hydroxide Gel is an suspension gel, form with colloid particles of aluminium hydroxide dispense in water. It contains not less than 3.60% and not more than 4.40% of aluminium hydroxide, calculated as Al_2O_3 .

A quantity of flavouring agent and preservatives may be added.

Description A white, viscous suspension gel; a thin layer of the suspension is translucent; a small amount of water may separate on standing; it exhibits a weak reaction to red or blue litmus paper, and no reaction to phenolphthalein IS.

Identification Heat and dissolve 5 ml in 10 ml of dilute hydrochloric acid, the solution yields the reactions characteristic of aluminium salts (Appendix III).

Neutralizing capacity To about 1.5 g, accurately weighed, in a 250 ml conical flask with stopper add 50 ml of hydrochloric acid (0.1 mol/L) VS, accurately measured, stopper the flask, shake for 1 hour continuously at 37°C. Add 6-8 drops of bromophenol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS until the solution becomes blue. The volume of hydrochloric acid (0.1 mol/L) consumed is 12.5-25.0 ml for each g of the substance being examined.

Chloride Boil and dissolve 0.40 g in 6 ml of dilute nitric acid, allow to cool, dilute to 50 ml with water and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.035%).

Sulfate Boil and dissolve 1.0 g in 1 ml of dilute hydrochloric acid, allow to cool, dilute to 50 ml with water and filter. Carry out the limit test for sulfates (Appendix VIII B), using 20 ml of filtrate. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of potassium sulfate standard solution (0.125%).

Heavy metals To 5.0 g add 5 ml of hydrochloric acid, evaporate to dryness on a water bath; add 5 ml of water, stir, continue to evaporate towards dryness, stir to produce a dry powder. Dissolve it by heat gently in 2 ml of acetate BS (pH 3.5) and 10 ml of water, filter. To the filtrate add a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.0005%.

Arsenic Boil 2.5 g in 10 ml of dilute sulfuric acid, allow to cool, add 5 ml hydrochloric acid and a quantity of water to produce 28 ml. Complies with the limit test for arsenic (Appendix VIII J, method 1) (0.00008%).

Assay Weigh accurately about 8 g and carry out the Assay described under Aluminium Hydroxide beginning at the words "in 10 ml each of hydrochloric acid...", Each ml of

disodium edetate (0.05 mol/L) VS is equivalent to 2.549 mg of Al_2O_3 .

Category As described under Aluminium Hydroxide.

Storage Preserve in tightly closed containers, protected from freezing.

Aluminium Hydroxide Tablets

Aluminium Hydroxide Tablets contain not less than 0.135 g of aluminium oxide (Al_2O_3) in each tablet.

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.5 g of aluminium hydroxide add 10 ml of dilute hydrochloric acid, heat to dissolve and filter, the filtrate yields the reactions characteristic of aluminium salts (Appendix III).

Neutralizing capacity Weigh accurately a quantity of the powdered tablets equivalent to about 0.15 g of aluminium hydroxide to a 250 ml conical flask with stopper, add accurately 50 ml of hydrochloric acid (0.1 mol/L) VS, stopper the flask and shake for an hour continuously at 37°C. Allow to cool, add 6-8 drops of bromophenol blue IS, titrate with sodium hydroxide (0.1 mol/L) VS. The volume of hydrochloric acid (0.01 mol/L) VS consumed is not less than 60 ml for each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A), except the disintegration test.

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity equivalent to about 0.6 g of aluminium hydroxide, carry out the Assay described under Aluminium Hydroxide. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.549 mg of Al_2O_3 .

Category As described under Aluminium Hydroxide.

Strength 0.3 g

Storage preserve in tightly closed containers, stored in a dry place.

Compound Aluminium Hydroxide Tablets

Compound Aluminium Hydroxide Tablets contain not less than 0.116 g of aluminium oxide (Al_2O_3). And not less than 0.020 g of magnesium oxide (MgO) in each tablet.

Formula	Aluminium Hydroxide	245 g
	Magnesium Trisilicate	105 g
	Belladonna Liquid Extract	2.6 ml
	to make	1000 tablets

Description White tablets.

Identification To about 6 powdered tablets add 30 ml of dilute hydrochloric acid, warm gently and filter. The filtrate complies with the following tests:

(1) Make 4 ml alkaline with ammonia TS, a gelatinous white precipitate is formed; add a few drops of sodium alizarin sulfonate IS, the precipitate becomes cherry red in colour.

(2) Make 4 ml alkaline with sodium hydroxide TS, a gelatinous white precipitate is produced, which is partially

soluble in 3 ml of sodium hydroxide TS. Filter and wash the precipitate with water, it is produced reddish brown colour on the addition of iodine TS.

(3) Make 20 ml alkaline with ammonia TS, extract with ether, evaporate the ether extract to dryness. To the residue add 3-4 drops of fuming nitric acid and evaporate on a water bath to dryness. Cool, to the residue add a small pellet of potassium hydroxide and a few drops of dehydrated ethanol; a violet colour is produced.

Neutralizing capacity Transfer accurately a quantity of the powdered tablets equivalent to a quarter of one tablet to a 250 ml glass-stoppered flask. Add accurately 50 ml of hydrochloric acid (0.1 mol/L) VS and shake continuously, maintaining the temperature at 37°C for 1 hour. Allow to cool, add 0.5 ml of bromophenol blue IS and titrate the excess acid with sodium hydroxide (0.1 mol/L) VS. The volume of hydrochloric acid (0.1 mol/L) VS consumed is not less than 60 ml per tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A); but the disintegration time is not more than 10 minutes, using hydrochloric acid solution (9→1000) instead of water.

Assay Aluminium oxide Weigh accurately and powder 10 tablets. To an accurately weighed quantity of the powder equivalent to about a quarter of one tablet add 50 ml of water and 2 ml of hydrochloric acid. Heat to boiling, cool and filter. Wash the residue with water, combine the washings with the filtrate, add ammonia TS until a precipitate is just formed and redissolve it by adding dropwise, dilute hydrochloric acid. Add 10 ml of acetic acid ammonium acetate BS (pH 6.0) and 25.0 ml of disodium edetate (0.05 mol/L) VS, heat to boil for 10 minutes. Cool, add 1 ml of xylenol orange IS and titrate with zinc (0.05 mol/L) VS until the colour changes from yellow to red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.549 mg of Al_2O_3 .

Magnesium oxide Weigh accurately a quantity of the powdered tablets equivalent to about 1 tablet, add 50 ml of water and 5 ml of hydrochloric acid, heat to boil, cool. Add 1 drop of methyl red IS, and then add ammonia TS dropwise until the colour changes from red to yellow. Boil again for 5 minutes, filter while hot, wash the residue with 30 ml of 2% ammonium chloride solution. Combine the washings with the filtrate and cool. Add 10 ml of ammonia TS, 5 ml of triethanolamine solution (1→2) and a small quantity of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS until the colour changes to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.015 mg of MgO .

Category Antacid.

Storage Preserve in tightly closed containers, stored in a dry place.

Amantadine Hydrochloride

$\text{C}_{10}\text{H}_{17}\text{N} \cdot \text{HCl}$ 187.71

[665-66-7]

Amantadine Hydrochloride is tricyclo [3.3.1.^{1,3,7}]

decan-1-amine hydrochloride. It contains not less than 99.0% of $C_{10}H_{17}N \cdot HCl$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; taste, bitter. Freely soluble in water or ethanol; soluble in chloroform.

Identification (1) Dissolve 10 mg in 2 ml of water, acidify with hydrochloric acid, add silicotungstic acid TS dropwise; a white precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amantadine hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 2.0 g in 10 ml of water, pH 3.5-5.0 (Appendix VI H).

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B), and any colour produced is not more intense than that of reference solution Y_2 (Appendix IX A, method 1).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 2.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5), carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0005%.

Assay Dissolve about 0.12 g, accurately weighed, in 30 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.77 mg of $C_{10}H_{17}N \cdot HCl$.

Category Anti-parkinsonian and antiviral.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Amantadine Hydrochloride Capsules
(2) Amantadine Hydrochloride Tablets
(3) Amantadine Hydrochloride Granules
(4) Amantadine Hydrochloride Syrup

Amantadine Hydrochloride Capsules

Amantadine Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of amantadine hydrochloride ($C_{10}H_{17}N \cdot HCl$).

Identification (1) Dissolve 10 mg of the contents of the capsules in 2 ml of water, acidify with hydrochloric acid and add dropwise silicotungstic acid TS; a white precipitate is produced.

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighted quantity of the mixed

contents obtained in the test for weight variation, equivalent to about 0.12 g of amantadine hydrochloride, in 30 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue, perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.77 mg of $C_{10}H_{17}N \cdot HCl$.

Category As described under Amantadine Hydrochloride.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Amantadine Hydrochloride Granules

Amantadine Hydrochloride Granules contain not less than 93.0% and not more than 107.0% of the labelled amount of amantadine hydrochloride ($C_{10}H_{17}N \cdot HCl$).

Description White granules; taste sweet.

Identification (1) To a quantity of the granules, equivalent to about 0.1 g of amantadine hydrochloride, add 5 ml of water, shake to dissolve amantadine hydrochloride and filter. Acidify the filtrate with hydrochloric acid, add dropwise silicotungstic acid TS; a white precipitate is formed.

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Triturate the contents of 20 packages, weigh accurately. Weigh accurately a quantity of the powdered granules, equivalent to about 0.3 g of amantadine hydrochloride, in a conical flask with stopper. Add 50 ml of ethanol, accurately measured, shake for 20 minutes to dissolve amantadine hydrochloride. Filter through a dry filter paper, transfer 20 ml of the successive filtrate, accurately measured, to a conical flask, and evaporate on a water bath to dryness. Dry the residue at 105°C for 30 minutes, cool. Carry out the Assay as described under Amantadine Hydrochloride, beginning at the words "in 30 ml of glacial acetic acid". Calculate the content of $C_{10}H_{17}N \cdot HCl$.

Category As described under Amantadine Hydrochloride.

Strength (1) 6 g : 60 mg (2) 12 g : 140 mg

Storage Preserve in tightly closed containers, protected from light.

Amantadine Hydrochloride Syrup

Amantadine Hydrochloride Syrup contains not less than 93.0% and not more than 107.0% of the labelled amount of amantadine hydrochloride ($C_{10}H_{17}N \cdot HCl$).

Formula	Amantadine Hydrochloride	5 g
	Sucrose	650 g
	Citric Acid	4 g
	Sodium Benzoate	3 g
	Flavouring agent	1 ml

Colouring matter	a quantity
Water	a quantity
To make	1000 ml

Description A clear, coloured viscous liquid.

Identification To 5 ml add 1 ml of 20% sodium hydroxide solution, mix well. Add 5 ml of ethyl acetate, shake thoroughly, allow to separate into two layers. To ethyl acetate layer add 5 ml of 1 mol/L hydrochloric acid solution, shake thoroughly, allow to separate into two layers. To 2 ml of the aqueous layer add dropwise silicotungstic acid TS; a white precipitate is formed.

pH value 3.0-4.0 (Appendix VI H).

Relative density Not less than 1.240 (Appendix VI A).

Other requirements Complies with the general requirements for syrup (Appendix I K).

Assay Measure accurately 50 ml with a "to contain" pipette, equivalent to about 250 mg of amantadine hydrochloride, into a separator. Wash the inner wall of the pipette with water in several portions. Combine the washings into the separator, add 13 ml of 20% sodium hydroxide solution, and mix well. Add accurately 40 ml of ethyl acetate, shake thoroughly for 15 minutes, allow it to separate. Measure accurately 20 ml of the ethyl acetate layer into 50 ml of glacial acetic acid in a conical flask, add 2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes from violet to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.77 mg of $C_{10}H_{17}N \cdot HCl$.

Category As described under Amantadine Hydrochloride.

Storage Preserve in tightly closed containers, protected from light.

Amantadine Hydrochloride Tablets

Amantadine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of amantadine hydrochloride ($C_{10}H_{17}N \cdot HCl$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.1 g of amantadine hydrochloride add 5 ml of water, shake and filter. The filtrate complies with tests (1) and (3) for Identification described under Amantadine Hydrochloride.

Other requirements Complies with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powder equivalent to about 0.3 g of amantadine hydrochloride, accurately weighed, in a 50 ml volumetric flask, add about 35 ml of ethanol, shaking for 20 minutes, dilute to volume with ethanol, mix well. Filter through a dry filter paper, transfer 20 ml of the successive filtrate, accurately measured, to a conical flask, and evaporate on a water bath to dryness. Dry the residue at 105°C for 30 minutes, cool. Carry out the Assay described under Amantadine Hydrochloride, beginning at the words "in 30 ml of glacial acetic acid...". Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.77 mg of $C_{10}H_{17}N \cdot HCl$.

Category As described under Amantadine Hydrochloride.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Ambroxol Hydrochloride

$C_{13}H_{18}Br_2N_2O \cdot HCl$ 414.57

Ambroxol Hydrochloride is trans-4-[(2-Amino-3,5-dibromobenzyl) amino] cyclohexanol hydrochloride. It contains not less than 99.0% of $C_{13}H_{18}Br_2N_2O \cdot HCl$, calculated on the dried basis.

Description A white to slightly yellow crystalline powder; practically odourless.

Soluble in methanol; sparingly soluble in water; slightly soluble in ethanol.

Specific absorbance Measure the absorbance of a solution of 25 μ g per ml in 0.01 mol/L hydrochloric acid at 244 nm (Appendix IV A), the value of E (1%, 1 cm) is 233-247.

Identification (1) The light absorption of a solution of 15 μ g per ml in 0.01 mol/L hydrochloric acid solution exhibits two maximum at 244 nm and 308 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Ambroxol Hydrochloride (Appendix XVI).

(3) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.20 g in 20 ml of water, pH 4.5-6.0 (Appendix VI H).

Clarity and colour of methanol solution Dissolve 0.50 g in 10 ml of methanol, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₃ (Appendix IX A, method 2).

Related substances Dissolve a quantity in the mobile phase to produce a solution of 1 mg per ml (test solution). Transfer 1 ml of the test solution in a 100 ml volumetric flask, dilute with the mobile phase, mix well (reference solution). Dissolve 5 mg in 0.2 ml of methanol, add 40 μ l of formaldehyde solution (1 \rightarrow 100), mix well, heat at 60°C for 5 minutes, dry it in nitrogen, dissolve the residue in 5 ml of water, dilute with the mobile phase to 20 ml, inject 20 μ l into the column. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L diammonium hydrogen phosphate solution (adjust the pH value to 7.0 with phosphate acid)-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 248 nm. The resolution factor between the peaks of ambroxol hydrochloride and the secondary B (the relative retention time is 0.8) is more than 4.0. Inject 20 μ l of reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is 20%-25% of the full scale of the recorder.

Inject accurately 20 μ l of test solution and reference solution into the column respectively, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all secondary peaks in the chromatogram obtained with the test solution is not greater than 1/3 of the principal peak area in the chromatogram obtained with the reference solution.

Residual solvents Dissolve a quantity, accurately weighed, in dimethylsulfoxide to produce a solution of 100 mg per ml (test solution). Dissolve a quantity of methanol and acetone, accurately weighed, in dimethylsulfoxide to produce a solution of 0.3 mg of methanol and 0.5 mg of acetone per ml (reference solution), transfer 1 ml of the reference solution in vaporization chamber. Carry out the test for residual solvents (Appendix VIII P method 2), using a column packed with (5%) diphenyl-(95) dimethyl silane polymer as the stationary phase, and maintain the injector temperature at 120°C and the detection temperature at 260°C. Temperature program: maintain the initial temperature of the column at 50°C for 5 minutes, then raising the temperature at a rate of 8°C per minute to 145°C, then raising the temperature at a rate of 35°C per minute to 260°C and maintain it at 260°C for 5 minutes. The relative deviation is not more than 10.0%. Inject the test solution into the column, measure in the same manner, the content of methanol and acetone complies with the related requirements.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Arsenic Dissolve 1.0 g in 10 ml of water and 15 ml of hydrochloric acid. Carry out limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.3 g, accurately weighed, in 5 ml of methanol, add 20 ml of glacial acetic acid, 5 ml mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid VS (0.1 mol/L) until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid VS (0.1 mol/L) is equivalent to 41.46 mg of $C_{13}H_{18}Br_2N_2O \cdot HCl$.

Category Extensorant.

Storage Preserve in tightly closed containers, protected from light.

Preparations (1) Ambroxol Hydrochloride Oral Solution (2) Ambroxol Hydrochloride Tablets (3) Ambroxol Hydrochloride Capsules (4) Ambroxol Hydrochloride Sustained-release Capsules

Ambroxol Hydrochloride Capsules

Ambroxol Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$).

Description Capsules containing white or almost white particles or powder.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ambroxol hydrochloride CRS in the chromatogram of the

reference solution.

(2) The light absorption of a solution under Dissolution exhibits two maximum at 244 nm and 308 nm (Appendix IV A).

Related substances Dissolve a quantity of the mixed content in the mobile phase to produce a solution of 1 mg of ambroxol hydrochloride per ml as the test solution and a solution of 10 μ g of ambroxol hydrochloride per ml as the reference solution. Carry out the chromatogram conditions as described under Assay. Inject 20 μ l of reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is 20%-25% of the full scale of the recorder. Inject accurately 20 μ l of test solution and reference solution into the column respectively, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all secondary peaks in the chromatogram obtained with the test solution is not greater than the principal peak area in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with the dissolution medium to 10 ml, mix well. Carry out the method for spectrophotometry (Appendix IV A), measure the absorbance at 244 nm. Dissolve a quantity of ambroxol hydrochloride CRS, accurately weighed, in the dissolution medium to produce a solution of 15 μ g per ml, measure the absorbance in the same manner. Calculate the dissolution of $C_{13}H_{18}Br_2N_2O \cdot HCl$ from each capsules, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for High performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L diammonium hydrogen phosphate solution (adjust the pH value to 7.0 with phosphate acid)-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 248 nm. Dissolve about 5 mg of ambroxol hydrochloride CRS in 0.2 ml of methanol, add 40 μ l of formaldehyde solution (1→100), mix well, heat at 60°C for 5 minutes, dry it in nitrogen, dissolve the residue in 5 ml of water, dilute with the mobile phase to 20 ml, inject 20 μ l into the column. The resolution factor between the peaks of ambroxol hydrochloride and the secondary B (the relative retention time is 0.8) is more than 4.0.

Procedure Weigh and powder a quantity of the contents. Dissolve a quantity of the powder, accurately measured, in mobile phase to produce a solution of 30 μ g of ambroxol hydrochloride per ml, filter. Inject 20 μ l of the successive filtrate into the column and record the peak areas correspondingly obtained in the chromatogram. Dissolve about a quantity of ambroxol hydrochloride CRS, accurately weighed, in mobile phase to produce a solution of 30 μ g per ml, inject the reference solution into the column, measure in the same manner. Calculate the content of $C_{13}H_{18}Br_2N_2O \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ambroxol Hydrochloride.

Strength 30 mg

Storage Preserve in tightly closed containers, protected from light.

Ambroxol Hydrochloride Oral Solution

Ambroxol Hydrochloride Oral Solution contains not less than 95.0% and not more than 105.0% of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$).

Description A clear, colourless or almost colourless viscous liquid; a clear, colourless or almost colourless liquid (sugarless).

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ambroxol hydrochloride CRS in the chromatogram of the reference solution.

(2) The light absorption of a solution of 30 μg per ml in 0.1 mol/L hydrochloric acid solution exhibits a maximum at 308 nm (Appendix IV A).

Relative density 1.090-1.200 (Appendix VI A) (contain sugar).

pH value 2.5-5.0 or 4.0-6.0 (sugarless) (Appendix VI H).

Clarity and colour A clear, colourless liquid; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y_2 (Appendix IX A, method 2).

Other requirements Complies with the general requirements for oral solution (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L diammonium hydrogen phosphate solution (adjust the pH value to 7.0 with phosphate acid)-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 248 nm. Dissolve about 5 mg of ambroxol hydrochloride CRS in 0.2 ml of methanol, add 40 μl of formaldehyde solution (1 \rightarrow 100), mix well, heat at 60°C for 5 minutes, dry it in nitrogen, dissolve the residue in 5 ml of water, dilute with the mobile phase to 20 ml, inject 20 μl into the column. The resolution factor between the peaks of ambroxol hydrochloride and the secondary B (the relative retention time is 0.8) is more than 4.0.

Procedure Measure accurately a quantity (viscous liquid with a "to contain" pipette), in mobile phase to produce a solution of 30 μg per ml. Inject 20 μl into the column and record the peak areas correspondingly obtained in the chromatogram. Dissolve a quantity of ambroxol hydrochloride CRS, accurately weighed, in mobile phase to produce a solution of 30 μg per ml, inject the reference solution into the column, measure in the same manner. Calculate the content of $C_{13}H_{18}Br_2N_2O \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ambroxol Hydrochloride.

Strengths (1) 5 ml : 15 mg (2) 60 ml : 180 mg
(3) 105 ml : 0.3 g (4) 100 ml : 0.3 g (sugarless)

Storage Preserve in tightly closed containers, protected from light.

Ambroxol Hydrochloride Sustained-release Capsules

Ambroxol Hydrochloride Sustained-release Capsules

contain not less than 95.0% and not more than 105.0% of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$).

Description Capsules containing white or almost white small pills.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ambroxol hydrochloride CRS in the chromatogram of the reference solution.

(2) The light absorption of a solution under Assay exhibits a maximum at 244 nm (Appendix IV A).

Related substances Dissolve a quantity of power of the mixed content in the mobile phase to produce a solution of 1 mg of ambroxol hydrochloride per ml as the test solution. Transfer 1 ml of the test solution in a 100 ml volumetric flask, dilute with the mobile phase, mix well as the reference solution. Carry out the chromatogram conditions as described under Assay. Inject 20 μl of reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is 20%-25% of the full scale of the recorder. Inject accurately 20 μl of test solution and reference solution into the column respectively, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all secondary peaks in the chromatogram obtained with the test solution is not greater than the principal peak area in the chromatogram obtained with the reference solution.

Drug release Carry out the method for drug release test (Appendix X D, method 1), with the apparatus of dissolution test (Appendix X C, method 2), using 1000 ml of sodium chloride hydrochloric acid solution (dissolve 2 g of sodium chloride in a quantity of water, add 7 ml of hydrochloric acid, dilute with water to 1000 ml, pH value is 1.2) as the release medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. The successive filtrate are used as the test solution (1). Replace the basket into 1000 ml phosphate BS (dissolve 6.805 g potassium dihydrogen phosphate in 22.4 ml of 1 mol/L sodium hydroxide, dilute with water to 1000 ml, pH value 6.8) as the release medium. Withdraw a sample of 5 ml of the solution at exact 2 and 4 hours respectively, filter and supply 5 ml of release medium accordingly in the vessel immediately. Transfer 2 ml of the successive filtrate in a 10 ml volumetric flask and dilute with the sodium chloride hydrochloric acid solution separately, mix well as the test solution (2) and (3). Carry out the method for spectrophotometry (Appendix IV A), measure the absorbance at 244 nm. Dissolve a quantity of ambroxol hydrochloride CRS, accurately weighed, in the sodium chloride hydrochloric acid solution to produce a solution of 25 μg per ml. Measure the absorbance in the same manner. Calculate the content of $C_{13}H_{18}Br_2N_2O \cdot HCl$ released from each capsule at 1, 2 and 4 hours separately. The dissolution of ambroxol hydrochloride complies with the requirement: the quantity released of each capsule is not less than 15%-45%, 45%-80% and over 80% of the labelled amount of $C_{13}H_{18}Br_2N_2O \cdot HCl$ at 1, 2 and 4 hours respectively.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L diammonium hydrogen phosphate solution (adjust the pH value to 7.0 with phosphate acid)-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 248 nm. Dissolve about 5 mg of ambroxol hydrochloride CRS in 0.2

ml of methanol, add 40 μ l of formaldehyde solution (1 \rightarrow 100), mix well, heat at 60°C for 5 minutes, dry it in nitrogen, dissolve the residue in 5 ml of water, dilute with the mobile phase to 20 ml, inject 20 μ l into the column. The resolution factor between the peaks of ambroxol hydrochloride and the secondary B (the relative retention time is 0.8) is more than 4.0.

Procedure Weigh and powder a quantity of the contents obtained in the test of Weigh Variation. Dissolve a quantity of the powder, accurately measured, in mobile phase to produce a solution of 30 μ g of ambroxol hydrochloride per ml, filter. Inject 20 μ l of the successive filtrate into the column and record the peak areas correspondingly obtained in the chromatogram. Dissolve a quantity of ambroxol hydrochloride CRS, accurately weighed, in mobile phase to produce a solution of 30 μ g per ml, inject the reference solution into the column, measure in the same manner. Calculate the content of $C_{13}H_{18}Br_2N_2O \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ambroxol Hydrochloride.

Strength 75 mg

Storage Preserve in tightly closed containers, protected from light.

Ambroxol Hydrochloride Tablets

Ambroxol Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of ambroxol hydrochloride ($C_{13}H_{18}Br_2N_2O \cdot HCl$).

Description White or almost white tablets.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ambroxol hydrochloride CRS in the chromatogram of the reference solution.

(2) The light absorption of a solution under Dissolution exhibits two maximum at 244 nm and 308 nm (Appendix IV A).

Related substances Dissolve a quantity of powdered tablets in the mobile phase to produce a solution of 1 mg of ambroxol hydrochloride per ml, filter and using the successive filtrate as the test solution. Transfer 1 ml of the test solution in a 100 ml volumetric flask, dilute with the mobile phase, mix well. Carry out the assay under the following conditions as described under Assay. Inject 20 μ l of reference solution into the column, adjust the sensitivity of the detector so that the principal peak height in the chromatogram is 20%-25% of the full scale of the recorder. Inject accurately 20 μ l of test solution and reference solution into the column respectively, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all secondary peaks in the chromatogram obtained with the test solution is not greater than the principal peak area in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of hydrochloric acid solution (9 \rightarrow 1000) as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with the dissolution medium to 10 ml, mix well. Carry out the method for spectrophotometry (Appendix IV A), measure the absorbance at 244 nm. Dissolve a quantity of ambroxol

hydrochloride CRS, accurately weighted, in the dissolution medium to produce a solution of 15 μ g per ml. Measure the absorbance in the same manner. Calculate the dissolution of $C_{13}H_{18}Br_2N_2O \cdot HCl$ from each tablet, not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L diammonium hydrogen phosphate solution (adjust the pH value to 7.0 with phosphate acid)-acetonitrile (50 : 50) as the mobile phase. Detection wavelength is 248 nm. Dissolve about 5 mg of ambroxol hydrochloride CRS in 0.2 ml of methanol, add 40 μ l of formaldehyde solution (1 \rightarrow 100), mix well, heat at 60°C for 5 minutes, dry it in nitrogen, dissolve the residue in 5 ml of water, dilute with the mobile phase to 20 ml, inject 20 μ l into the column. The resolution factor between the peaks of ambroxol hydrochloride and the secondary B (the relative retention time is 0.8) is more than 4.0.

Procedure Weigh accurately and powder 20 tablets. Dissolve a quantity of the powder, accurately measured, in mobile phase to produce a solution of 30 μ g of ambroxol hydrochloride per ml, filter. Inject 20 μ l of the successive filtrate into the column and record the peak areas correspondingly obtained in the chromatogram. Dissolve about a quantity of ambroxol hydrochloride CRS, accurately weighed, in mobile phase to produce a solution of 30 μ g per ml, inject the reference solution into the column, measure in the same manner. Calculate the content of $C_{13}H_{18}Br_2N_2O \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Ambroxol Hydrochloride.

Strength 30 mg

Storage Preserve in tightly closed containers, protected from light.

Amphetamine Sulfate

$C_{18}H_{26}N_2 \cdot H_2SO_4$ 368.49

[60-13-9]

Amphetamine sulfate is (\pm)- α -methyl-benzene-ethanamine sulfate. It contains not less than 98.0% and not more than 100.5% of $C_{18}H_{26}N_2 \cdot H_2SO_4$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter and then numbing. Freely soluble in water; slightly soluble in ethanol; insoluble in ether.

Identification (1) Dissolve about 0.1 g in 5 ml of water, add 5 ml of sodium hydroxide TS, cool to 10-15°C, add 1 ml of a mixture of benzoyl chloride-dehydrated ether (1 : 2), stopper and shake for 3 minutes. Filter, wash the precipitate with 10 ml of cold water, and recrystallize twice with dilute ethanol, the crystals of the benzoyl derivative of amphetamine is produced. Dry at 80°C for 2 hours, it melts at 131-135°C (Appendix VI C).

(2) Dissolve about 5 mg in 4 ml of water, add 1 ml of 1 mol/L hydrochloric acid solution, 2 ml of diazotized *p*-nitroaniline TS, 4 ml of sodium hydroxide solution (1 mol/L) and 2 ml of butanol. Shake and allow to stand until two separate layers are produced, the colour of butanol layer is red.

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity or alkalinity Dissolve 0.50 g in 25 ml of water, add 0.1 ml of methyl red IS, not more than 0.1 ml of hydrochloric acid (0.01 mol/L) VS or sodium hydroxide (0.01 mol/L) VS is required to change the colour of solution.

Clarity and colour of solution A Solution of 0.2 g in water is clear and colourless.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of water in a separator, add 8 ml of sodium hydroxide TS, saturated with sodium chloride. Extract with 15 ml each of ether for 6 times, combine ether extracts, wash with 10 ml of water and extract the washing with 10 ml of ether. Combine ether extracts, add accurately 25 ml of sulfuric acid (0.05 mol/L) VS, shake thoroughly, expel ether on a water bath at a warm temperature, cool to room temperature. Add 2 drops of methyl red IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 18.42 mg of $C_{18}H_{26}N_2 \cdot H_2SO_4$.

Category Psychostimulant

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Amfetamine Sulfate Injection
(2) Amfetamine Sulfate Tablets

Amfetamine Sulfate Injection

Amfetamine Sulfate Injection is a sterile solution of amfetamine sulfate in water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of amfetamine sulfate ($C_{18}H_{26}N_2 \cdot H_2SO_4$).

Description A clear, colourless liquid.

Identification Complies with tests (2) and (3) for Identification described under Amfetamine sulfate.

pH value 5.0-6.5 (Appendix VI H).

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Measure accurately a quantity of the injection equivalent to about 50 mg of amfetamine sulfate in a separator, add a quantity of water to produce about 20 ml, and 3 ml of sodium hydroxide TS, saturated with sodium chloride. Extract with ether for 6 times, using 30 ml for the first time and then each of 15 ml. Combine the ether extracts, wash with 10 ml of water, extract the washing with 10 ml of ether. Combine ether extracts, add accurately 20 ml of sulfuric acid (0.01 mol/L) VS, shake thoroughly, heat on a warm water bath to remove ether and cool to room temperature. Add 1-2 drops of methyl red IS, titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 3.685 mg of

$C_{18}H_{26}N_2 \cdot H_2SO_4$.

Category As described under amfetamine sulfate.

Strength (1) 1 ml : 5 mg (2) 1 ml : 10 mg

Storage Preserve in well closed containers, protected from light.

Amfetamine Sulfate Tablets

Amfetamine Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of amfetamine sulfate ($C_{18}H_{26}N_2 \cdot H_2SO_4$).

Description White tablets; taste, slightly bitter.

Identification To a quantity of powdered tablets, equivalent to about 0.1 g of amfetamine sulfate, add 10 ml of water, macerate for 30 minutes, filter. The filtrate complies with tests for Identification described under Amfetamine Sulfate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 15 tablets (for 10 mg) or 25 tablets (for 5 mg). Transfer an accurately weighed quantity of the powder equivalent to about 50 mg of amfetamine sulfate to a conical flask. Add 30 ml of water and 1 ml of dilute sulfuric acid, shake and allow to stand for 2 hours with constantly shaking. Filter wash the residue with water. Combine the filtrate and washings, evaporate to about 20 ml on a water bath, cool to room temperature, add 5 ml of sodium hydroxide TS, saturated with sodium chloride. Extract with ether for 6 times, using 30 ml for the first time and then each of 15 ml. Combine the extracts, wash with 10 ml of water, extract the washing with 10 ml of ether. Combine ether extracts, add accurately 20 ml of sulfuric acid (0.01 mol/L) VS, shake thoroughly, heat on a warm water bath to remove ether, cool to room temperature. Add 1-2 drops of methyl red IS, titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 3.685 mg of $C_{18}H_{26}N_2 \cdot H_2SO_4$.

Category As described under Amfetamine sulfate.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Amikacin

$C_{22}H_{43}N_5O_{13}$ 585.61

[37517-28-5]

Amikacin is O-3-amino-3-deoxy-α-D-glucopyranosyl-(1→6)-O-[(6-amino-6-deoxy-α-D-glucopyra-

nosyl-(1 → 4)]-N'-(4-amino-2-hydroxyl-1-oxobutyl)-2-deoxy-D-streptamine. It has a potency of not less than 910 amikacin Units per mg, calculated on the dried basis.

Description A white or almost white powder or crystalline powder; almost odourless; tasteless. Freely soluble in water; practically insoluble in ethanol.

Specific optical rotation +97° to +105°, in a solution of 20 mg per ml in water (Appendix VI E).

Identification (1) Dissolve 10 mg in 1 ml of water, add 4 ml of a 0.1% solution of anthrone in sulfuric acid; a bluish-purple colour is produced.

(2) Dissolve 10 mg in 1 ml of water, add 1 ml of a 4% solution of sodium hydroxide, mix well and add 2 ml of a 5% solution of cobaltous nitrate; a purple flocculent precipitate is produced.

(3) Carry out the method for thin-layer chromatography (Appendix V B) described under Related substances. Apply separately to the plate 2 µl each of the two solutions in water containing (1) 5 mg of the substance being examined per ml and (2) 5 mg of Amikacin RS per ml. The position and colour of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot in the chromatogram obtained with solution (2).

Alkalinity Dissolve 0.1 g in 10 ml of water, pH 9.5-11.5 (Appendix VI H).

Clarity and colour of solution Dissolve 0.6 g each of the 5 portions with sulfuric acid solution (0.5 mol/L) to produce solutions of 0.12 g per ml respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Related substance Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance, and a mixture of chloroform-methanol-concentrate ammonia solution-water (1 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 2 µl each of three solutions in water containing (1) 10 mg of the substance being examined per ml, (2) 0.2 mg of the substance being examined per ml, (3) 3 mg of per ml of each of the amikacin RS and impurity A CRS, after developing and removal of the plate, allow it to dry in air and spray with a 0.2% solution of ninhydrin in n-butanol saturated with water and heat at 100°C for 10 minutes. The spot of amikacin and impurity in the chromatogram obtained with solution (3) is separated completely. Any spot other than principal in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 120°C, losses not more than 7.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 2.2 EU per 1000 Amikacin Units.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of about 1000 Units per ml and carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Amikacin Units are equivalent to 1 mg of C₂₂H₄₃N₅O₁₃.

Category Aminoglycoside antibiotic

Storage Preserve in hermetically sealed containers, stored

in a dry place.

Amikacin Sulfate

C₂₂H₄₃N₅O₁₃ · 1.8 H₂SO₄ 762.15

C₂₂H₄₃N₅O₁₃ · 2 H₂SO₄ 781.76 [39831-28-5]

Amikacin Sulfate is O-3-amino-3-deoxy-α-D-glucopyranosyl-(1 → 6)-O-[6-amino-6-deoxy-α-D-glucopyranosyl-(1 → 4)]-N-(4-amino-2-hydroxy-1-oxobutyl)-2-deoxy-D-streptamine sulfate. It has a potency of not less than 690 Amikacin Units per mg (n=1.8) or not less than 674 Amikacin units per mg (n=2), calculated on the dried basis.

Description A white or almost white powder or crystalline powder; almost odourless; tasteless. Very soluble in water; practically insoluble in methanol, acetone, ether or chloroform.

Specific optical rotation +72° to +85°, in a solution of 20 mg per ml in water (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), described under Related substances. Apply separately to the plate 2 µl each of two solutions in water containing (1) 5 mg per ml of substance being examined and (2) 5 mg per ml of Amikacin RS. The position and colour of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot in the chromatogram obtained with solution (2).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Amikacin Sulfate RS (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity or alkalinity Dissolve a quantity in water to produce a solution of 10 mg per ml, pH 6.0-7.5 (n=1.8) or 2.4-4.0 (n=2) (Appendix VI H).

Clarity and colour of solution To 0.3 g each of 5 portions add water to produce solutions of 0.06 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance, and a mixture of chloroform-methanol-concentrate ammonia solution-water (1 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 2 µl each of three solutions in water containing (1) 10 mg of the substance being examined per ml, (2) 0.2 mg of the substance being examined per ml, (3) 3 mg per ml of each of the amikacin RS and impurity A CRS, after developing

and removal of the plate, allow it to dry in air and spray with a 0.2% solution of ninhydrin in n-butanol saturated with water and heat at 100°C for 10 minutes. The spot of amikacin and impurity in the chromatogram obtained with solution (3) is separated completely. Any spot other than principal in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (2%).

Sulfate Dissolve 0.25 g, accurately weighed, in 100 ml of water, adjust the pH to 11 with concentrated ammonia solution, add 10 ml of barium chloride (0.1 mol/L) VS and 5 drops of metaphthalein IS. Titrate with disodium edetate (0.05 mol/L) VS, when the colour of the solution begin to change slightly add 50 ml of ethanol and continue titration until the violet colour disappears. Perform a blank determination and make any necessary correction. Each ml of barium chloride (0.1 mol/L) VS is equivalent to 0.009 606 g of sulfate (SO_4). The content of sulfate is not less 21.0% and not more than 24.0% ($n=1.8$), or not less 22.8% and not more than 26.0% ($n=2$) calculated on the dried basis.

Loss on drying When dried over phosphorous pentoxide in vacuum at 110°C for 3 hours, loses not more than 13.0% (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 2.2 EU per 1000 Amikacin Units.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), using not less than 2 portions each containing the maximum dose of the preparation being examined, to each portion add not less than 500 ml of 0.9% sterile sodium chloride solution to produce a solution.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of 1000 Units per ml and carry out the Microbiological Assay of Antibiotics (Appendix XI A). 1000 Amikacin Units are equivalent to 1 mg of $\text{C}_{22}\text{H}_{43}\text{N}_5\text{O}_{13}$.

Category Aminoglycosides antibiotic.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation (1) Amikacin Sulfate for Injection
(2) Amikacin Sulfate Injection

Amikacin Sulfate for Injection

Amikacin Sulfate for Injection is a powder steril crystalline powder or sterile lyophilized preparation of amikacin sulfate. It contains not less than 93.0% and not more than 107.0% of the labelled potency of amikacin ($\text{C}_{22}\text{H}_{43}\text{N}_5\text{O}_{13}$), calculated on the basis of the average weight of contents.

Description A white or almost white powder or crystalline powder or loose masses.

Identification Complies with the Identification tests described under Amikacin Sulfate.

Clarity and colour of solution To each of 5 containers add 5 ml of water, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_3 or YG_3 (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance, and a mixture of chloroform-methanol-concentrate ammonia solution-water (1 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 2 μl each of three solutions in water containing (1) 10 mg of the substance being examined per ml, (2) 0.3 mg of the substance being examined per ml, (3) 3 mg of per ml of each of the amikacin RS and impurity A CRS, after developing and removal of the plate, allow it to dry in air and spray with a 0.2% solution of ninhydrin in n-butanol saturated with water and heat at 100°C for 10 minutes. The spot of amikacin and impurity in the chromatogram obtained with solution (3) is separated completely. Any spot other than principal in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Acidity or alkalinity, Loss on drying, Bacterial endotoxin, sterility Complies with the corresponding tests described under Amikacin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Amikacin Sulfate, using an accurately weighed quantity of the mixed contents obtained from the test for Weight variation of contents.

Category As described under Amikacin Sulfate.

Strength 0.2 g (200000 Units)

Storage Preserve in well closed containers, stored in a dry place.

Amikacin Sulfate Injection

Amikacin Sulfate Injection is a sterile aqueous solution of amikacin sulfate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of amikacin ($\text{C}_{22}\text{H}_{43}\text{N}_5\text{O}_{13}$).

Description A clear, colourless to slightly yellow liquid.

Identification (1) Complies with test (1) for Identification described under Amikacin, using a quantity of the substance being examined and Amikacin RS.

(2) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

pH value 4.0-7.0 (Appendix VI H).

Colour of solution The solution is colourless, any colour produced is not more intense than that of reference solution Y_3 or YG_3 (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance, and a mixture of chloroform-methanol-concentrate ammonia solution-water (1 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 2 μl each of three solutions in water containing (1) 10 mg of the substance being examined per ml, (2) 0.3 mg of the substance being examined per ml, (3) 3 mg of per ml of each of the amikacin RS and impurity A CRS, after developing and the removal of the plate, allow it to dry in air and spray with a 0.2% solution of ninhydrin in n-butanol saturated with water and heat at 100°C for 10 minutes. The spot of amikacin and impurity in the chromatogram obtained with solution (3) is separated completely. Any spot other than principal in the chromatogram obtained with solution (1) is not more intense than the principal

spot obtained with solution (2).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.33 EU per 1000 Amikacin Units.

Sterility Complies with the test for Sterility (Appendix IX H, membrane filtration method), using not less than 2 portions. To each portion add not less than 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity and carry out the assay described under Amikacin Sulfate.

Category As described under Amikacin Sulfate.

Strength (1) 1 ml : 0.1 g (100000 Units)
(2) 2 ml : 0.2 g (200000 Units)

Storage Preserve in well closed containers, stored in a cool and dark place.

Amiloride Hydrochloride

$C_6H_8ClN_7O \cdot HCl \cdot 2H_2O$ 302.1

Amiloride hydrochloride is *N*-Amidino-3,5-diamino-6-chloropyrazine-2-carboxamide hydrochloride dihydrate. It contains not less than 98.5% of $C_6H_8ClN_7O \cdot HCl$, calculated on the dried basis.

Description A pale yellow or yellowish green powder; odourless or practically odourless; taste, bitter. Slightly soluble in water; very slightly soluble in ethanol; practically insoluble in chloroform or ether.

Identification (1) The light absorption of a solution of about 10 µg per ml in (0.1 mol/L) hydrochloric acid solution exhibits maxima at 285 nm and 362 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Amiloride hydrochloride (Appendix XVI).

(3) Dissolve about 20 mg in 20 ml of water, add excessive nitric acid dropwise to precipitate entirely, filter, the filtrate yields reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 20 ml of water, pH 3.8-5.2 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dioxane-diluted ammonia solution-water (90 : 6 : 6) as the mobile phase. Apply separately to the plate 10 µl each of the solutions in methanol containing (1) 2 mg per ml of the substance being examined, (2) 10 µg per ml and (3) 4 µg per ml of 3,5-diamino-6-chloropyrazine-2-carboxylic methyl ester CRS. After developing and removal of the plate, dry it in air and examine under ultra-violet light (365 nm). The fluorescence intensity of the spot in the chromatogram obtained with solution (1), corresponding to the spot obtained with solution (2), is not more intense than that of the principal spot obtained with solution (2). Any other secondary spots

in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (3).

Loss on drying When dried in vacuum to constant weight at 100°C, loses not less than 11.0% and not more than 13.0% of its weight (Appendix VIII C).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition: not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in a mixture of 50 ml of glacial acetic acid, 5 ml of mercuric acetate TS and 8 ml of dioxane, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue, perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.61 mg of $C_6H_8ClN_7O \cdot HCl$.

Category Diuretics.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Amiloride Hydrochloride Tablets
(2) Compound Amiloride Hydrochloride Tablets

Amiloride Hydrochloride Tablets

Amiloride Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of amiloride hydrochloride ($C_6H_8ClN_7O \cdot HCl$).

Description Pale yellow tablets.

Identification (1) Dissolve a quantity of the powdered tablets in hydrochloric acid solution (0.1 mol/L) to produce a solution of 10 µg of amiloride hydrochloride per ml, filter, the light absorption of the filtrate exhibits maxima at 285 nm and 362 nm (Appendix IV A).

(2) Triturate 1 tablets, add 25 ml of methanol, shake thoroughly and filter, using the filtrate as a test solution. Dissolve a quantity of amiloride hydrochloride CRS in methanol to produce a reference solution of 0.2 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance and a mixture of dioxane-diluted ammonia solution-water (90 : 6 : 6) as the mobile phase. Apply separately to the plate 10 µl each of the resulting two solutions, after developing and removal of the plate, dry it in the air, and examined under ultra-violet light (365 nm). The fluorescence and position of the principal spot in the chromatogram obtained with the test solution corresponding to that of the principal spot obtained with the reference solution.

Content uniformity Transfer 1 powdered tablet to a 50 ml volumetric flask, carry out the method described under Assay and comply with the requirements for content uniformity (Appendix X E).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm, withdraw 10 ml of the solution after exactly 30 minutes and filter. Measure the absorbance of the filtrate at 362 nm (Appendix IV A). Dissolve an accurately weighed quantity of amiloride hydrochloride CRS in

(0.1 mol/L) hydrochloric acid solution to produce a solution of 2.5 µg per ml, measure the absorbance as the same procedure. Calculate the dissolution of $C_6H_8ClN_7O \cdot HCl$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and triturate 10 tablets, weigh accurately a quantity, equivalent to about 5 mg of amiloride hydrochloride, to a 100 ml volumetric flask, add 60 ml of 0.1 mol/L hydrochloric acid solution, heat in a water bath for about 30 minutes with shaking to dissolve amiloride hydrochloride, cool, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well. Transfer immediately a quantity to a centrifuging with stopper and centrifuge. Measure accurately 5 ml of the supernatant liquid into a 25 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well. Measure the absorbance at 362 nm (Appendix IV A). Dissolve an accurately weighed quantity of amiloride hydrochloride CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 10 µg per ml, measure the absorbance as the same procedure. Calculate the content of $C_6H_8ClN_7O \cdot HCl$.

Category As described under Amiloride Hydrochloride.

Strength 2.5 mg

Storage Preserve in tightly closed containers, protected from light.

Compound Amiloride Hydrochloride Tablets

Compound Amiloride Hydrochloride Tablets contain not less than 2.25 mg and not more than 2.75 mg of amiloride hydrochloride ($C_6H_8ClN_7O \cdot HCl$) and not less than 22.5 mg and not more than 27.5 mg of hydrochlorothiazide ($C_7H_8ClNO_4S_2$).

Formula	Amiloride hydrochloride	2.5 g
	Hydrochlorothiazide	25 g
	to make	1000 tablets

Description Almost White tablets.

Identification The retention times of the principal peaks of amiloride hydrochloride and hydrochlorothiazide in the substance being examined in the chromatogram obtained in the Assay are identical with those of the principal peaks of amiloride hydrochloride CRS and hydrochlorothiazide CRS in the chromatogram of the reference solution correspondingly.

Content Uniformity Comply with the requirement for content uniformity (Appendix X E). Transfer 1 powdered tablet to a 25 ml volumetric flask, add 7.5 ml of methanol and 1 ml of 0.1 mol/L hydrochloric acid solution, carry out the method described under Assay, beginning at the words "Ultrasonicate to dissolve amiloride hydrochloride...".

Dissolution Carry out the "dissolution" test (Appendix X C, method 1), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 20 ml of the solution after exactly 30 minutes and filter, carry out the following tests, using the filtrate.

Amiloride hydrochloride Measure the absorbance of the filtrate at 365 nm (Appendix IV A). Dissolve an accurately weighed quantity of amiloride hydrochloride CRS in 0.1 mol/L

hydrochloric acid solution to produce a solution of 2.5 µg per ml, measure the absorbance as the same procedure. Calculate the dissolution of $C_6H_8ClN_7O \cdot HCl$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Hydrochlorothiazide Transfer 5 ml of the filtrate to a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well. Measure the absorbance at 272 nm (Appendix IV A). Dissolve an accurately weighed quantity of hydrochlorothiazide CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 2.5 µg per ml, measure the absorbance as the same procedure. Calculate the dissolution of $C_7H_8ClNO_4S_2$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer solution (Dissolve 13.6 g of potassium dihydrogen phosphate in 80 ml of water, adjust the pH value to 3.0 with phosphoric acid, dilute with water to 100 ml)-methanol-water (4 : 25 : 71) as the mobile phase. Detection wavelength is 286 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of amiloride hydrochloride. The resolution factor between amiloride hydrochloride and hydrochlorothiazide complies with the related requirements.

Procedure Weigh accurately and triturate 10 tablets, weigh accurately a quantity equivalent to about 5 mg of amiloride hydrochloride to a 50 ml volumetric flask, add 15 ml of methanol and 2 ml of 0.1 mol/L hydrochloric acid solution. Ultrasonicate to dissolve amiloride hydrochloride and hydrochlorothiazide, dilute with water to volume, mix well, filter. Inject 10 µl of the successive filtrate into the column and record the chromatogram. Dissolve 100 mg of hydrochlorothiazide CRS, accurately weighed, in 20 ml of methanol in a 100 ml volumetric flask, add accurately 10 ml of a solution of 1 mg of amiloride hydrochloride CRS per ml in methanol, add 4 ml of 0.1 mol/L hydrochloric acid solution, dilute with water to volume, inject 10 µl into the column. Calculate the content of $C_6H_8ClN_7O \cdot HCl$ and $C_7H_8ClNO_4S_2$ respectively with respect to the peak area obtained in the chromatogram by the external standard method.

Category Diuretics.

Storage Preserve in tightly closed containers, protected from light.

Aminoglutethimide

$C_{13}H_{16}N_2O_2$ 232.28

Aminoglutethimide is 2-(*p*-aminophenyl)-2-ethylglutarimide. It contains not less than 99.0% of $C_{13}H_{16}N_2O_2$, calculated on the dried basis.

Description A white crystalline powder.

Very soluble in acetone; soluble in methanol and chloro-

form; sparingly soluble in ethanol; practically insoluble in water.

Melting point 150-153°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in ethanol at 242 nm (Appendix IV A), the value of A (1%, 1 cm) is 489-519.

Identification (1) To about 10 mg add 3 drops of furfural solution (dissolve 10 drops of furfural in 10 ml of dehydrated ethanol, add 10 ml of glacial acetic acid, shake well), a red colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Aminogluthethimide (Appendix XVI).

Acidity or alkalinity Dissolve 10 mg in 0.5 ml of methanol, add 10 ml of water, shake well. pH 6.2-7.3 (Appendix VI H).

Sulfate Dissolve 0.25 g in 1 ml of dilute hydrochloric acid and a quantity of water. Carry out the limit test for sulfate (Appendix VIII B), any opalescence produced is not more pronounced than that of a reference solution using 0.5 ml of potassium sulfate standard solution (0.02%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-ethyl acetate (7 : 3) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in chloroform containing (1) 10 mg per ml, (2) 0.2 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, repeat this operation for 3 times. Examine under ultra-violet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII), m.g l. . g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.2 g, accurately weighed, in 30 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 23.23 mg of C₁₃H₁₆N₂O₂.

Category Adrenocortical suppressant; antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Aminogluthethimide Tablets

Aminogluthethimide Tablets

Aminogluthethimide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of aminogluthethimide (C₁₃H₁₆N₂O₂).

Description White tablets.

Identification (1) The powder, equivalent to 10mg of aminogluthethimide, complies with the test for Identification (1) described under Aminogluthethimide.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 242 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of hydrochloric acid solution (7→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with phosphate BS (pH 7.4) to produce a solution of 12.5 µg per ml. Dissolve 12.5 mg of aminogluthethimide CRS, in hydrochloric acid solution (7→1000) and dilute to 100 ml, transfer 5 ml to a 50 ml volumetric flask, dilute with phosphate BS (pH 7.4) to volume and mix well. Measure the absorbances of the resulting solutions at 237 nm (Appendix IV A). Calculate the dissolution of C₁₃H₁₆N₂O₂ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 20 mg of aminogluthethimide into a 100 ml volumetric flask, add a quantity of ethanol, warm on a water bath for 10 minutes, cool, add ethanol to volume and mix well. Filter, transfer 5 ml of the successive filtrate, accurately measured, to a 100 ml volumetric flask, add ethanol to volume and mix well. Measure the absorbance of the resulting at 242 nm (Appendix IV A). Calculate the content of C₁₃H₁₆N₂O₂, taking 504 as the value of A (1%, 1 cm).

Category As described under Aminogluthethimide.

Strength (1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Aminophylline

C₂H₈N₂ (C₇H₈N₄O₂)₂ · 2H₂O 456.46 [5877-66-5]

Aminophylline is 3,7-dihydro-1,3-dimethyl-1H-Purine-2,6-dione, compound with 1,2-ethanediamine (2 : 1), dihydrate. It contains not less than 84.0% and not more than 87.4% of C₇H₈N₄O₂; not less than 13.5% and not more than 15.0% of C₂H₈N₂, calculated on anhydrous basis.

Description White to slightly yellow granules or a powder; odour, slightly ammoniacal; taste, bitter. Upon exposure to air it absorbs carbon dioxide with the liberation of free theophylline. Its aqueous solution is alkaline. Soluble in water; slightly soluble in ethanol; practically insoluble in ether.

Identification (1) Dissolve about 0.2 g in 10 ml of water, add dropwise, with constant stirring, 1 ml of dilute hydrochloric acid, filter, wash the precipitate with small portions of water and dry at 105°C for 1 hour. Complies with the tests for Identification described under Theophylline. (2) Dissolve 30 mg in 1 ml of water, add 2-3 drops of 1% cupric sulfate solution, shake; a violet colour is produced.

which turns to bluish-violet and finally to dark blue on the addition of cupric sulfate solution dropwise.

Clarity and colour of solution Dissolve 0.5 g in 10 ml of freshly boiled and cooled water by warming the solution is clear and colourless. Any colour produced is not more intense than that reference solution YG₂ (Appendix IX A, method 1).

Related Substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of *n*-butanol-acetone-chloroform-concentrated ammonia solution (40 : 30 : 30 : 10) as the mobile phase. Dissolve 0.20 g of the substance being examined in 2 ml of water by warming, cool, dilute, with methanol to 10 ml (solution 1), measure accurately 1 ml, dilute with methanol to 200 ml (solution 2). Apply separately to the plate 10 µl each of solution (1) and (2), after developing and removal of the plate, dry it in the air, and examine under ultra-violet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Water Not more than 8.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay *Ethylenediamine* Weigh accurately about 0.25 g, dissolve in 25 ml of water, add 8 drops of sodium alizarin-sulfonate IS, titrate with sulfuric acid (0.05 mol/L) VS until the colour changes to yellow. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 3.005 mg of C₂H₈N₂.

Anhydrous Theophylline To above titrated solution add 20 ml of silver nitrate (0.1 mol/L) VS, shake, titrate with sodium hydroxide (0.1 mol/L) VS immediately, until the colour changes to red. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 18.02 mg of C₇H₈N₄O₂.

Category Smooth muscle relaxant and diuretic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Aminophylline Injection
(2) Aminophylline Sustained-release Tablets
(3) Aminophylline Tablets

Aminophylline Injection

Aminophylline Injection is a sterile solution of Aminophylline in Water for Injection. It contains anhydrous theophylline (C₇H₈N₄O₂) not less than 74.0% and not more than 84.0% of the labelled amount of aminophylline.

Description A clear colourless to slightly yellow liquid.

Identification Complies with the tests for Identification described under Aminophylline.

pH value Not more than 9.6 (Appendix VI H).

Colour of solution Dilute a quantity of the injection with water to produce a solution containing 12.5% of aminophylline, any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Dilute an accurately measured quantity of the injection, 0.01 mol/L with sodium hydroxide solution to

produce a solution of about 10 µg per ml. Measure the absorbance at 275 nm (Appendix IV A). Calculate the content of C₇H₈N₄O₂, taking 650 as the value of A (1%, 1 cm).

Category As described under Aminophylline.

Strength (1) 2 ml : 0.125 g (2) 2 ml : 0.25 g
(3) 2 ml : 0.5 g (4) 10 ml : 0.25 g

Storage Preserve in well closed containers, protected from light.

Aminophylline Sustained-release Tablets

Aminophylline Sustained-release Tablets contain aminophylline consisting of not less than 74.0% and not more than 84.0% of the labelled amount of anhydrous theophylline (C₇H₈N₄O₂) and ethylenediamine (C₂H₈N₂) contains not less than 11.25% of the labelled amount of aminophylline.

Description Film coated tablets with white to slightly yellow core.

Identification Triturate a quantity of the powdered tablets equivalent to about 0.5 g of aminophylline with 25 ml of water, filter. The filtrate exhibits alkaline reaction and complies with the tests for Identification described under Aminophylline.

Drug release Carry out the drug release test (Appendix X D, method 1), using the apparatus described under dissolution test method 1 and using 1000 ml of dilute hydrochloric acid (24 → 1000) as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw each 10 ml of the solution after exactly 2, 4 and 6 hours, respectively, add 10 ml of the same dissolution medium to the vessel to compensate the volume. Filter, to each 5 ml of the successive filtrate, accurately measured, add 4.5 ml of 0.1 mol/L sodium hydroxide solution, dilute with 0.01 mol/L sodium hydroxide solution to produce 25 ml or 50 ml and mix well. Measure the absorbance of the resulting solutions at 275 nm (Appendix IV A), calculate the drug release from each tablet at different time interval, taking 650 as the value of A (1%, 1 cm). The amount of aminophylline released in 2, 4 and 6 hours is 25%-45%, 35%-55% and not less than 50% of the labelled amount, respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay *Anhydrous Theophylline* Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powdered tablets, equivalent to about 100 mg of aminophylline, to a 200 ml volumetric flask. Add 20 ml of sodium hydroxide solution (0.1 mol/L) and 60 ml of water, shake well for 10 minutes, dilute with water to volume and mix well. Filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 250 ml volumetric flask, dilute with sodium hydroxide solution (0.01 mol/L) to volume and mix well. Measure the absorbance of the resulting solution at 275 nm (Appendix IV A). Calculate the content of C₇H₈N₄O₂, taking 650 as the value of A (1%, 1 cm).

Ethylenediamine Transfer an accurately weighed quantity of the powdered tablets, equivalent to about 0.8 g of aminophylline, to a 100 ml volumetric flask, shake with a quantity of water and warm, allow to cool, dilute with

water to volume and mix well. Filter, to 50 ml of the successive filtrate, accurately measured, add 8 drops of sodium alizarinsulfonate IS, titrate with hydrochloric acid (0.1 mol/L) VS until the colour changes to yellow. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 3.005 mg of $C_2H_8N_2$.

Category As described under Aminophylline.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Aminophylline Tablets

Aminophylline Tablets contain anhydrous theophylline ($C_7H_8N_4O_2$) not less than 74.0% and not more than 84.0% of the labelled amount of aminophylline; contains ethylenediamine ($C_2H_8N_2$) not less than 11.25% of the labelled amount of aminophylline.

Description White to slightly yellow tablets.

Identification Triturate a quantity of powdered tablets equivalent to 0.5 g of aminophylline with 20 ml of water, filter; the filtrate is alkaline. The filtrate complies with the tests for Identification described under Aminophylline.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 800 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 10 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with 0.01 mol/L sodium hydroxide solution to produce a solution of 10 µg per ml. Measure the absorbance at 275 nm (Appendix IV A). Calculate the dissolution of $C_7H_8N_4O_2$ from each tablet, taking 650 as the value of A (1%, 1 cm). Not less than 60% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Anhydrous Theophylline Weigh accurately and powder 20 tablets. To a quantity of the powder equivalent to 100 mg of aminophylline, accurately weighed, in a 200 ml volumetric flask add 20 ml of 0.1 mol/L sodium hydroxide solution and 60 ml of water, shake for 10 minutes, dilute with water to volume and mix well. Filter, discard the initial filtrate. Measure accurately 5 ml of the successive filtrate into a 250 ml volumetric flask, dilute with 0.01 mol/L sodium hydroxide solution to volume and mix well. Measure the absorbance at 275 nm (Appendix IV A). Calculate the content of $C_7H_8N_4O_2$, taking 650 as the value of A (1%, 1 cm).

Ethylenediamine To a quantity of the powdered tablets equivalent to 0.5 g of aminophylline, accurately weighed, add 50 ml of water and warm to dissolve. Allow to cool, add 8 drops of sodium alizarinsulfonate IS, titrate with hydrochloric acid (0.1 mol/L) VS until the colour changes to yellow. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 3.005 mg of $C_2H_8N_2$.

Category As described under Aminophylline.

Strength (1) 20 mg (2) 30 mg (3) 0.1 g (4) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Amiodarone Hydrochloride

$C_{25}H_{29}I_2NO_3 \cdot HCl$ 681.78

Amiodarone Hydrochloride is 2-butyl-3-[3,5-diiodo-4-(2-diethylaminoethoxy)benzoyl]benzofuran hydrochloride. It contains not less than 98.5% of $C_{25}H_{29}I_2NO_3 \cdot HCl$ calculated on the dried basis.

Description A white to slightly yellow crystalline powder; odourless; tasteless.

Freely soluble in chloroform; soluble in ethanol; slightly soluble in acetone; practically insoluble in water.

Melting range 158-162°C, with decomposition (Appendix V C).

Identification (1) Dissolve 20 mg in 2 ml of ethanol, add 2 ml of a solution of 2,4-dinitrophenylhydrazine in perchloric acid (dissolve 1.2 g of 2,4-dinitrophenylhydrazine in 50 ml of 30% perchloric acid) and 5 ml of water; a yellow precipitate is formed.

(2) Heat gently 50 mg with 1 ml of sulfuric acid; violet iodine vapor is evolved.

(3) The light absorption of a solution of 10 µg per ml in ethanol exhibits a maximum at 242 nm and a minimum at 223 nm (Appendix IV A). The ratio of the absorbance at 242 nm to that at 223 nm is 1.47-1.61.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amiodarone hydrochloride (Appendix XVI).

(5) The ethanolic solution yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of methanol solution A solution of 1.0 g in 20 ml of methanol is clear and colourless. Any colour produced is not more intense than that of reference solution Y₃ (Appendix IX A, method 1).

Acidity Dissolve 0.50 g in 10 ml of water by warming, cool to room temperature, pH 3.4-3.9 (Appendix VI H).

Free iodine Shake 0.50 g with 10 ml of water for 30 seconds, allow to stand for 5 minutes and filter. To the filtrate, add 1 ml of dilute sulfuric acid and 2 ml of chloroform, shake well; the chloroform layer exhibits no colour.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of chloroform-methanol-anhydrous formic acid (80 : 15 : 5) as the mobile phase. Apply separately to the plate 10 µl each of two solutions of the substance being examined in methanol containing (1) 20 mg per ml, (2) 0.10 mg per ml. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Iodine Weigh accurately about 20 mg, carry out the method for oxygen flask combustion (Appendix VII C), using 2 ml of sodium hydroxide TS and 10 ml of water as the

absorbing liquid. When the process is complete, add 10 ml of bromine-acetic acid solution (dissolve 10 g of potassium acetate in a quantity of glacial acetic acid, add 0.4 ml of bromine and dilute with glacial acetic acid to 100 ml). Stopper the flask, shake, allow the solution to stand for several minutes and add about 1 ml of formic acid. Wash the mouth of the flask with water and introduce an air stream into the flask for 3-5 minutes to expel the excess of bromine vapour. Then add 2 g of potassium iodide, stopper the flask, mix well and titrate with sodium thiosulfate (0.02 mol/L) VS. Add 1 ml of starch IS towards the end of titration and continue the titration until the blue colour just disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.02 mol/L) VS is equivalent to 0.423 mg of iodine (I), not less than 36.0% and not more than 38.0% of iodine.

Loss on drying When dried in vacuum at 50°C for 4 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.50 g, accurately weighed, in 20 ml of glacial acetic acid by warming, add 6 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until a blue colour is produced. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 68.18 mg of $C_{25}H_{29}I_2NO_3 \cdot HCl$.

Category Antiarrhythmic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Amiodarone Hydrochloride Capsules
(2) Amiodarone Hydrochloride Injection
(3) Amiodarone Hydrochloride Tablets

Amiodarone Hydrochloride Capsules

Amiodarone Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of amiodarone hydrochloride ($C_{25}H_{29}I_2NO_3 \cdot HCl$).

Identification (1) Dissolve a quantity of the contents of the capsules equivalent to about 20 mg of amiodarone hydrochloride in 2 ml of ethanol, add 2 ml of a solution of 2,4-dinitrophenylhydrazine in perchloric acid (dissolve 1.2 g of 2,4-dinitrophenylhydrazine in 50 ml of 30% perchloric acid) and 5 ml of water; a yellow precipitate is formed.

(2) To a quantity of the contents of the capsules equivalent to about 50 mg of amiodarone hydrochloride add 1 ml of sulfuric acid and heat gently, the violet iodine vapour is evolved.

(3) Dissolve a quantity of the contents of the capsules in ethanol to produce a solution of 10 µg per ml, filter. The light absorption of the filtrate exhibits a maximum at 242 nm and a minimum at 223 nm (Appendix IV A).

(4) Shake a quantity of the contents of the capsules equivalent to about 50 mg of amiodarone hydrochloride with 5 ml of ethanol, filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Related substances Dissolve a quantity of the contents of the capsules in methanol to produce a solution containing 20 mg per ml of amiodarone hydrochloride as the test solution

(filter if necessary). Dilute an accurately measured quantity of the test solution with methanol to produce a solution of 0.20 mg per ml as the reference solution. Proceed as described under Amiodarone Hydrochloride beginning at the words "carry out the method for thin-layer chromatography (Appendix V B)...". It complies with the requirements.

Loss on drying When dried in vacuum at 50°C for 4 hours, loses not more than 1.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about 0.1 g of amiodarone hydrochloride in a conical flask with stopper, add 20 ml of water, 50 ml of chloroform and 5 ml of dilute sulfuric acid. Then add 1 ml of dimethyl yellow solvent blue 19 IS and titrate with sodium dioctylsulfo-succinate TS, shake vigorously towards the end of titration and continue titration until the chloroform layer changes from green to reddish-grey. Perform a reference titration using 0.1 g of amiodarone hydrochloride CRS. Calculate the content of $C_{25}H_{29}I_2NO_3 \cdot HCl$ from the volume ratio of sodium dioctylsulfo succinate TS consumed in the two titrations.

Category As described under Amiodarone Hydrochloride.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Amiodarone Hydrochloride Injection

Amiodarone Hydrochloride Injection is a sterile solution of Amiodarone Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of amiodarone hydrochloride ($C_{25}H_{29}I_2NO_3 \cdot HCl$).

Description A clear, pale yellow liquid.

Identification To a quantity equivalent to about 0.2 g of amiodarone hydrochloride add 10 ml of chloroform, shake and filter the chloroform layer. Evaporate the filtrate to dryness, the residue complies with the test (1), (2), (3) and (5) for Identification described under Amiodarone Hydrochloride.

pH value 2.5-4.0 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of chloroform-methanol-anhydrous formic acid (85 : 15 : 5) as the mobile phase. Apply separately to the plate 10 µl each of two solutions of the substance being examined in methanol containing (1) 20 mg per ml, (2) 0.20 mg per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer an accurately measured quantity equivalent to about 0.15 g of amiodarone hydrochloride to a conical flask with stopper, add 20 ml of water, 50 ml of chloroform and 5 ml of dilute sulfuric acid. Then add 1 ml of dimethyl yellow solvent blue 19 IS and titrate with sodium

dioctylsulfo-succinate TS, Shake vigorously towards the end of titration and continue titration until the chloroform layer changes from green to reddish-grey. Perform a reference titration using 0.15 g of amiodarone hydrochloride CRS. Calculate the content of $C_{25}H_{29}I_2NO_3 \cdot HCl$ from the volume ratio of sodium dioctylsulfo succinate TS consumed in the two titrations.

Category As described under Amiodarone Hydrochloride.

Strength (1) 2 ml : 150 mg (2) 3 ml : 150 mg

Storage Preserve in well closed containers, protected from light.

Amiodarone Hydrochloride Tablets

Amiodarone Hydrochloride Tablets contain not less than 95.0% and not more than 105.0% of amiodarone hydrochloride ($C_{25}H_{29}I_2NO_3 \cdot HCl$).

Description Almost white tablets.

Identification Triturate 1 tablet and shake with 10 ml of chloroform, filter and evaporate the filtrate to dryness. The residue complies with tests (1), (2), (3) and (5) for Identification described under Amiodarone Hydrochloride.

Related substances Dissolve a quantity of powdered tablets in methanol to produce two solution of the substance being examined, containing (1) 20 mg per ml (2) 0.20 mg per ml. Proceed as described under Amiodarone Hydrochloride beginning at the words "carry out the method for thin-layer chromatography (Appendix V B)...". It complies with the requirements.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. To a quantity of the powdered tablets, equivalent to 0.1 g of amiodarone hydrochloride, accurately weighed, in a glass stoppered flask, add 20 ml of water, 50 ml of chloroform and 5 ml of dilute sulfuric acid. Then add 1 ml of dimethyl yellow solvent blue 19 IS and titrate with sodium dioctylsulfo-succinate TS, Shake vigorously towards the end of titration and continue titration until the chloroform layer changes from green to reddish-grey. Perform a reference titration using 0.1 g of amiodarone hydrochloride CRS. Calculate the content of $C_{25}H_{29}I_2NO_3 \cdot HCl$ from the volume ratio of sodium dioctylsulfo succinate TS consumed in the two titrations.

Category As described under Amiodarone Hydrochloride.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Amitriptyline Hydrochloride

$C_{20}H_{23}N \cdot HCl$ 313.87

[549-18-8]

Amitriptyline Hydrochloride is 3-(10,11-dihydro-5H-dibenzo [*a,d*] cyclohepten-5-ylidene)-N,N-dimethyl-1-propanamine hydrochloride. It contains not less than 99.0% of $C_{20}H_{23}N \cdot HCl$, calculated on the dried basis.

Description Colourless crystals or a white to almost white powder; odourless or almost odourless; taste, bitter, hot and numbing. Freely soluble in water, methanol, ethanol or chloroform; practically insoluble in ether.

Melting range 195-199°C (Appendix VI C).

Identification (1) Dissolve 5 mg in 2 ml of sulfuric acid; a red colour is produced.

(2) The light absorption of a solution of 12 µg per ml in hydrochloric acid solution (9→1000) exhibits maximum at 239 nm, the absorbance is about 0.51-0.56 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amitriptyline hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.5-6.0 (Appendix VI H).

Clarity and colour of solution A solution of 0.20 g in 10 ml of water is clear and colourless. Any colour produced is not more intense than reference solution Y_2 or OY_2 (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-toluene (1 : 1) as the mobile phase. Apply to the plate 5 µl of a solution of 10 mg per ml in ethanol. After developing and removal the plate, dry it in the air and spray with formaldehyde-sulfuric acid (4 : 96). Examine immediately under an ultra-violet light (365 nm). No spot other than the principal spot is appeared in the chromatogram.

Loss on drying When dried in vacuum over phosphorus pentoxide at 60°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%; use 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.0015%.

Assay Dissolve 0.3 g, accurately weighed, in 20 ml of glacial acetic acid by warming. Allow to cool, add 5 ml of mercuric acetate TS and 1 ml of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bright blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.39 mg of $C_{20}H_{23}N \cdot HCl$.

Category Antidepressant

Storage Preserve in tightly closed containers, protected from light.

Preparation Amitriptyline Hydrochloride Tablets

Amitriptyline Hydrochloride Tablets

Amitriptyline Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the

labelled amount of amitriptyline hydrochloride ($C_{20}H_{23}N \cdot HCl$).

Description Sugar coated tablets with white core.

Identification (1) The light absorption of the solution obtained in the Assay exhibits a maximum at 239 nm (Appendix IV A).

(2) Triturate 1 tablet with 4 ml of water, filter, to the filtrate add 2 drops of dilute nitric acid and 2 drops of silver nitrate TS; a white precipitate is formed.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of solution after exactly 45 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with the above dissolution medium to volume in a 10 ml volumetric flask, mix well. Proceed as described under assay beginning at the word "Measure the absorbance...". Calculate the dissolution from each tablet, not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately 20 tablets with the coating removed to a 200 ml volumetric flask. Add 100 ml of hydrochloric acid solution (9→1000), shake for 30 minutes to dissolve amitriptyline hydrochloride, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Filter and dilute 5 ml of the successive filtrate, accurately measured, with hydrochloric acid solution (9→1000) to volume in a 100 ml volumetric flask and mix well. Transfer 10 ml of above solution into a 100 ml volumetric flask, accurately measured, dilute with the solution to volume and mix well. Measure the absorbance at 239 nm (Appendix IV A). Calculate the content of $C_{20}H_{23}N \cdot HCl$, taking 444 as the value of A (1%, 1 cm).

Category, Storage As described under Amitriptyline Hydrochloride.

Strength 25 mg

Dilute Ammonia Solution

Dilute Ammonia Solution contains 9.5%-10.5% (g/ml) of ammonia (NH_3).

Formula	Strong Ammonia Solution	420 ml
	Water	a quantity
	Total	1000 ml

Description A clear, colourless liquid; odour, pungent and characteristic; alkaline.

Relative density 0.955-0.962 (Appendix VI A).

Identification Dip a glass rod into hydrochloric acid and hold it above the surface of the substance being examined, dense white fumes are produced.

Assay To 5 ml, accurately measured, in a stoppered conical flask containing 25 ml of water add 2 drops of methyl red IS and titrate with sulfuric acid (0.5 mol/L) VS. Each ml of sulfuric acid (0.5 mol/L) VS is equivalent to 17.03 mg of NH_3 .

Category Stimulant.

Storage Preserve in tightly closed containers, stored at a temperature below 30°C.

Ammonium Chloride

NH_4Cl 53.49

[12125-02-9]

Ammonium Chloride contains not less 99.5% of NH_4Cl , calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; odourless; taste, salty and chilly; hygroscopic. Freely soluble in water; slightly soluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of ammonium salts (Appendix III) and chlorides (Appendix III).

Acidity Dissolve 2.0 g in 10 ml of water, pH 4.0-6.0 (Appendix IV H).

Barium Dissolve 4.0 g in 20 ml of water, filter. Divide the filtrate into 2 equal parts. To one part add 2 ml of dilute sulfuric acid and to the other part add 2 ml of water, allow to stand for 15 minutes. The solutions are equal in clarity.

Loss on drying When dried over sulfuric acid to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Heat 1.0 g with a small flame until ammonium chloride is completely evaporated, cool, add 25 ml of water to the residue. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference, using 5.0 ml of iron standard solution (0.005%).

Heavy metals Dissolve 2.0 g in 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Arsenic Dissolve 0.40 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than (0.0005%).

Assay Dissolve about 0.12 g, accurately weighed, in 50 ml of water, add 5 ml of dextran solution (1→50), 8 drops of fluorescein IS and 0.10 g of calcium carbonate, shake well. Titrate the solution with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.349 mg of NH_4Cl .

Category Expectorant and auxiliary diuretics.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Ammonium Chloride Tablets

Ammonium Chloride Tablets

Ammonium Chloride Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of ammonium chloride (NH_4Cl).

Description White tablets.

Identification Its aqueous solution yields the reactions characteristic of ammonium salts and chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.12 g of ammonium chloride and carry out the Assay described under Ammonium Chloride. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.349 mg of NH_4Cl .

Category As described under Ammonium Chloride.

Strength 0.3 g

Storage Preserve in tightly closed containers, stored in a dry place.

Amobarbital

$\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$ 226.28

[57-43-2]

Amobarbital is 5-ethyl-5-(3-methylbutyl)-2,4,6-(1*H*,3*H*,5*H*)-pyrimidinetrione. It contains not less than 98.5% of $\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Freely soluble in ethanol or ether; soluble in chloroform; very slightly soluble in water; soluble in aqueous solution of sodium hydroxide or sodium carbonate.

Melting point 155-158.5°C (Appendix VI C).

Identification (1) Yields the reactions characteristic of malonylureas (Appendix III).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amobarbital (Appendix XVI).

Clarity of solution Dissolve 1.0 g in 10 ml of sodium hydroxide solution TS, the solution is clear.

Chlorides Boil 0.30 g with 30 ml of water for 2 minutes, cool, filter, add water through the filter to produce 50 ml. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of this filtrate, any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.047%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Weigh accurately about 0.2 g and dissolve in 40 ml of methanol, add 15 ml of freshly prepared 3% anhydrous sodium carbonate solution. Carry out the method for potentiometric titration (Appendix VII A), titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 22.63 mg of $\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$.

Category Hypnotic and anticonvulsant agent.

Storage Preserve in tightly closed containers.

Preparation Amobarbital Tablets

Amobarbital Tablets

Amobarbital Tablets contain not less than 94.0% and not more than 106.0% of the labelled amount of amobarbital ($\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets equivalent to about 0.5 g of amobarbital in 10 ml of sodium carbonate TS with gentle heating, filter. Add hydrochloric acid dropwise to the filtrate, until no more precipitate is formed, filter. The residue, washed with water and dried at 105°C, has a melting point of 155-158.5°C (Appendix VI C) and yields the reactions characteristic of malonylureas (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml of phosphate BS (pH 7.6) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with phosphate BS to volume and mix well. Dissolve a quantity of amobarbital CRS, accurately weighed, in phosphate BS to produce a solution of 35 µg per ml. Measure the absorbance of the resulting solution at 239 nm (Appendix IV A). Calculate the dissolution of $\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$ from each tablet, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Add 40 ml of methanol to a quantity of the powder equivalent to about 0.2 g, accurately weighed, of amobarbital and shake to dissolve the amobarbital. Carry out the Assay described under Amobarbital beginning at the words "add 15 ml of freshly prepared 3% anhydrous sodium carbonate solution...". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 22.63 mg of $\text{C}_{11}\text{H}_{18}\text{N}_2\text{O}_3$.

Category As described under Amobarbital.

Strength 0.1 g

Storage Preserve in tightly closed containers.

Amobarbital Sodium

$\text{C}_{11}\text{H}_{17}\text{N}_2\text{NaO}_3$ 248.26

[64-43-7]

Amobarbital Sodium is 5-ethyl-5-(3-methylbutyl)-2,4,6-(1*H*,3*H*,5*H*)-pyrimidinetrione monosodium salt. It contains not less than 98.5% of $\text{C}_{11}\text{H}_{17}\text{N}_2\text{NaO}_3$, calculated on the dried basis.

Description White granules or a white powder; odourless; taste, bitter; hygroscopic. The aqueous solution yields alkaline reaction.

Very soluble in water; soluble in ethanol; practically insoluble in chloroform or ether.

Identification (1) Dissolve about 0.5 g in 10 ml of water, add 0.5 ml of hydrochloric acid, a white precipitate of amobarbital is produced. Filter, the residue, washed with water and dried at 105°C, has a melting point of 155-158.5°C (Appendix VI C).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amobarbital sodium (Appendix XVI).

(3) Yields the reactions characteristic of malonylureas (Appendix III).

(4) Ignite about 0.1 g, the residue yields the reactions characteristic of sodium salts (Appendix III).

Alkalinity Dissolve 1.0 g in 20 ml of water, pH 9.5-11.0 (Appendix VI H).

Loss on drying When dried to constant weight at 130°C, loses not more than 4.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in 43 ml of water, add slowly 3 ml of dilute hydrochloric acid with constant shaking. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 23 ml of the successive filtrate, add 2 ml of acetate BS (pH 3.5); not more than 0.002%.

Sterility Dissolve a quantity of the powder in 10 ml of sterile water, complies with the test for sterility (Appendix XI H).

Assay Carry out the Assay described under Amobarbital, using about 0.2 g, accurately weighed. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 24.83 mg of $C_{11}H_{17}N_2NaO_3$.

Category Anticonvulsant.

Storage Preserve in hermetically sealed containers, protected from light.

Preparation Amobarbital Sodium for Injection

Amobarbital Sodium for Injection

Amobarbital Sodium for Injection is a sterile powder of Amobarbital Sodium. It contains not less than 93.0% and not more than 107.0% of the labelled amount of amobarbital sodium ($C_{11}H_{17}N_2NaO_3$), calculated on the basis of average weight of content.

Description White granules or a white powder.

Identification Complies with the tests (1), (3) and (4) for Identification described under Amobarbital Sodium.

Alkalinity Dissolve 0.50 g in 10 ml of water, pH 9.5-11.0 (Appendix VI H).

Loss on drying When dried to constant weight at 130°C, loses not more than 5.0% of its weight (Appendix VIII L).

Sterility Dissolve separately the contents of two containers in sterile water to produce two solutions of 50 mg per ml, the resulting solutions comply with the test for sterility (Appendix XI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Amobarbital, using the mixed contents obtained from the test for weight variation of content. The content of $C_{11}H_{17}N_2NaO_3$, calculated on the dried basis, is not less than 98.5%. Then calculated on the basis of average weight of content. Each ml

of silver nitrate (0.1 mol/L) VS is equivalent to 24.83 mg of $C_{11}H_{17}N_2NaO_3$.

Category As described under Amobarbital Sodium.

Strength (1) 0.1 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Amoxicillin

$C_{16}H_{19}N_3O_5S \cdot 3H_2O$ 419.46

[61336-70-7]

Amoxicillin is (2S,5R,6R) 6-[(R)-(–)-2-amino-2 (P-hydroxyphenyl) acetamido]-3,3-dimethyl-7-oxo-4-thia-azabicyclo [3.2.0] heptane-2-carboxylic acid trihydrate. It contains not less than 95.0% of $C_{16}H_{19}N_3O_5S$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; taste, slightly bitter.

Slightly soluble in water; practically insoluble in ethanol.

Specific optical rotation +290° to +315°, in a solution of 2 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of amoxicillin CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amoxicillin (Appendix XVI).

Acidity Dissolve a quantity in water by gently heating on a water bath at 50 °C to produce a solution of 5 mg per ml, pH 3.5-5.5 (Appendix VI H).

Clarity of solution To 5 portions each of 1.0 g add 10 ml of 0.5 mol/L hydrochloric acid solution and 2 mol/L ammonia solution separately, the solution is clear; any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase A to produce a solution of 2 mg per ml as the test solution; dissolve an accurately weighed quantity of amoxicillin CRS in mobile phase A to produce a solution of 20 µg per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. A mixture of 0.05 mol/L phosphate buffer solution (0.05 mol/L potassium dihydrogen phosphate solution, adjust the pH value with 2 mol/L sodium hydroxide solution to 5.0) - acetonitrile (99 : 1) as mobile phase A; the mobile phase B is 0.05 mol/L phosphate buffer solution (pH 5.0) - acetonitrile (80 : 20). The flow rate is 1 ml per min and detection wavelength is 254 nm. Start the elution isocratically with a mobile phase ratio A : B of 92 : 8, immediately after elution of the amoxicillin peak start the following linear gradient.

Time(min)	Mobile phase A(%)	Mobile phase B(%)
0	92	8
25	0	100
40	0	100
41	92	8
55	92	8

The number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution and record the chromatogram. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1 percent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than three times the area of the principal peak in the chromatogram obtained with the reference solution (3 percent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Amoxicillin polymer Carry out the method for size-exclusion chromatography (Appendix V H), using a column with 1.3-1.6 cm in internal diameter and 30-40 cm height packed with sephadex G-10 (40-120 μ m), a phosphate buffer solution [0.05 mol/L disodium hydrogen phosphate solution-0.05 mol/L sodium dihydrogen phosphate (95 : 5), pH 8.0] as mobile phase A and water as mobile phase B. The flow rate is 1.5 ml per minute and the detection wavelength is 254 nm. Inject 200 μ l of a solution of 0.1 mg/ml dextran blue 2000 per ml into the column, elute with mobile A and mobile B separately. The number of the theoretical plates of the column is not less than 700 and the tailing factor is not more than 2.0, calculated with reference to the peak of dextran blue 2000, using mobile phase A and B as eluent. The ratio of retention time of dextran blue 2000 peak in the two mobile phases is between 0.93-1.07, the ratio of retention time of the polymer peak of the test solution and the dextran blue 2000 peak in mobile phase A is between 0.93-1.07, the ratio of retention time of the principal peak of the reference solution and the dextran blue 2000 peak in mobile phase B is between 0.93-1.07. The relative standard deviation (RSD) of the areas of the principal peak in chromatogram obtained with 200 μ l of the reference solution for several replicate injections is not more than 5.0%, using mobile phase B as the eluent.

Reference solution Dissolve an accurately weighed quantity of benzylpenicillin CRS in water to produce a solution of 0.2 mg per ml.

Procedure Weigh accurately 0.2 g of the substance being examined in a 10 ml volumetric flask, add 4 ml of sodium carbonate solution (2%) to dissolve amoxicillin, dilute to volume with water, mix well as test solution. Inject immediately 200 μ l into the column and record the chromatogram, using mobile phase A as the eluent. Inject 200 μ l the reference solution into the column and record the chromatogram, using mobile phase B as the eluent. The content of amoxicillin polymer is not more than 0.15%, calculate as amoxicillin ($C_{16}H_{19}N_3O_5S$) with respect to the peak area obtained in the chromatogram by the external standard method (amoxicillin; benzylpenicillin=1 : 10).

Water 12.0%-15.0% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid

chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution (adjust the pH with 2 mol/L potassium hydroxide solution to 5.0)-acetonitrile (97.5 : 2.5) as the mobile phase. The flow rate is 1 ml per min. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin.

Procedure Dissolve about 25 mg of amoxicillin, accurately weighed, in 50 ml volumetric flask, dilute with the mobile phase to volume, mix well. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using amoxicillin CRS instead of the substance being examined. Calculate the content of $C_{16}H_{19}N_3O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, penicillins.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Amoxicillin Tablets
(2) Amoxicillin Capsules

Amoxicillin Capsules

Amoxicillin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$).

Identification The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of amoxicillin CRS in the reference solution correspondingly.

Amoxicillin polymer Weigh accurately a quantity of the mixed contents, equivalent to about 200 mg of amoxicillin, to a 10 ml volumetric flask, add 5 ml of 2% sodium carbonate solution to dissolve the amoxicillin. Dilute to volume with water, mix well and filter, using the successive filtrate immediately as the test solution. Carry out the method described under Amoxicillin, the content of amoxicillin polymer is not more than 0.2%, calculate as amoxicillin ($C_{16}H_{19}N_3O_5S$).

Related substances Dissolve a quantity of the mixed contents in mobile phase A to produce a solution of 2 mg of amoxicillin per ml, filter, using the successive filtrate as the test solution. Carry out the method for Related substances described under Amoxicillin. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (2 percent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with the reference solution (5%). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Measure accurately a quantity of the successive filtrate and dilute with water to produce a solution of 130 μ g per ml as the test solution. Measure the absorbances of the test solutions at 272 nm (Appendix IV A). Dissolve a quantity

of the mixed contents obtained from the test for weight variation of contents, equivalent to about average weight of one capsule, in water to produce a solution of 130 μ g of amoxicillin per ml as the reference solution. Measure the absorbance of the reference solutions at 272 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{19}N_3O_5S$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Water Not more than 16.0% (Appendix VIII M, method 1 A).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents, equivalent to about 0.125 g of amoxicillin, in phosphate buffer solution (pH 5.0) to produce a solution of 0.5 mg per ml, filter. Carry out the Assay described under Amoxicillin.

Category As described under Amoxicillin.

Strength Calculated as $C_{16}H_{19}N_3O_5S$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Amoxicillin Tablets

Amoxicillin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$).

Description White or almost white tablets.

Identification The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of amoxicillin CRS in the reference solution correspondingly.

Related substances Dissolve a quantity of powdered tablets in mobile phase A to produce a solution of 2 mg of amoxicillin per ml, filter, using the successive filtrate as the test solution. Carry out the method for Related substances described under Amoxicillin. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (2 percent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with the reference solution (5 percent). Disregard and peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 30 minutes and filter, measure accurately a quantity of the successive filtrate and dilute with water to produce a solution of 130 μ g per ml as the test solution. Measure the absorbance of the test solutions at 272 nm (Appendix IV A). Powder 10 tablets and weigh accurately a quantity of the powder equivalent to about average weight of one tablet. Dissolve in water to produce a solution of 130 μ g per ml as the reference solution. Measure the absorbances of the reference solutions at 272 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{19}N_3O_5S$ from each tablet. Not less than 80% of the labelled amount

is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.125 g of amoxicillin and dissolve in phosphate buffer solution (pH 5.0) to produce a solution of 0.5 mg per ml, filter. Carry out the Assay described under Amoxicillin.

Category As described under Amoxicillin.

Strength Calculated as $C_{16}H_{19}N_3O_5S$ (1) 0.125 g
(2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Amoxicillin and Clavulanate Potassium Tablets

Amoxicillin and Clavulanate Potassium Tablets is a mixed preparation of amoxicillin and clavulanate potassium. (The ratio of the labelled content of amoxicillin and clavulanic acid is 2 : 1 or 4 : 1 or 7 : 1). It contains not less than 90.0% and not more than 110.0% of the labelled content of amoxicillin ($C_{16}H_{19}N_3O_5S$) and clavulanate ($C_8H_9NO_5$).

Description Film coated tablets with almost white to pale yellow core; taste, slightly bitter; hygroscopic.

Identification The retention time of principal peaks of amoxicillin and clavulanate in the substance being examined in the chromatogram obtained in the Assay are identical with that of principal peaks of amoxicillin CRS and clavulanate CRS in the chromatogram of the reference solution correspondingly.

Dissolution Carry out the dissolution test (Appendix X C method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 30 minutes, filter, take the successive filtrate as the test solution. Dissolve an accurately weighed quantity of amoxicillin CRS and clavulanic acid CRS in water to produce a mixture solution as the reference solution, the concentration is equivalent to the test solution. Carry out the method described under Assay, calculate the dissolution of amoxicillin and clavulanic acid from each tablet respectively. Not less than 80% of the labelled amount is dissolved.

Related substances Dissolve an accurately weighed quantity of the powdered tablets equivalent to the average weight of one tablet in mobile phase A to produce a solution of 2 mg of amoxicillin per ml, filter, take the successive filtrate as the test solution; dissolve an accurately weighed quantity of amoxicillin CRS in mobile phase A to produce a solution of 40 μ g per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. The 0.01 mol/L potassium dihydrogen phosphate solution (pH 6.0) as mobile phase A; the mobile phase B is 0.01 mol/L potassium dihydrogen phosphate solution (pH 6.0)-acetonitrile (20 : 80). The flow rate is 1 ml per min and elute with linear gradient as the following table, detection wavelength is 254 nm. The retention time of amoxicillin is about 10 minutes. The number of the theoretical plates of the column is not less than 2000,

calculated with reference to the peak of amoxicillin. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution and record the chromatogram. In the chromatogram obtained with the test solution, calculate the contents of impurities of which retention time is longer than that of amoxicillin: the area of any peak, apart from the principal peak, is not more than 2.0%; the sum of the areas of all the peaks, apart from the principal peak, is not more than 5.0%, calculated with reference to the labelled amount of amoxicillin.

Time(min)	Mobile phase A(%)	Mobile phase B(%)
0	95	5
0.5	95	5
30.5	59	41
32	95	5
40	95	5

Water Carry out the method for Determination of Water (Appendix VIII M, method 1, A), using a quantity of fine powder. The content of water is not more than 7.5% (for strength of $C_{16}H_{19}N_3O_5S$ 250 mg or less than 250 mg); not more than 10.0% (for strength of $C_{16}H_{19}N_3O_5S$ from 250 mg to 500 mg); not more than 11.0% (for strength of $C_{16}H_{19}N_3O_5S$ more than 500 mg).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L potassium dihydrogen phosphate solution (adjust the pH value with 2 mol/L sodium hydroxide solution to 6.0)-acetonitrile (96 : 4) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin. The resolution factor between the peaks of amoxicillin and clavulanic acid is not less than 3.5.

Procedure Powder finely 10 tablets, dissolve an accurately weighed quantity of the powdered tablets (equivalent to about the average weight of one tablet) in water to produce a solution of 1.0 mg of amoxicillin per ml, filter. Inject 10 μ l of the successive filtrate into the column and record the chromatogram. Dissolve an accurately weighed quantity of amoxicillin CRS and clavulanic acid CRS in water to produce a mixture solution as the reference solution, the concentration is equivalent to the test solution. Repeat the operation and calculate the contents of $C_{16}H_{19}N_3O_5S$ and $C_8H_9NO_5$ with respect to the peak areas obtained in the chromatogram by the external standard method respectively.

Category β -lactam antibiotic, penicillins.

Strength (1) 0.375 g ($C_{16}H_{19}N_3O_5S$ 0.25 g; $C_8H_9NO_5$ 0.125 g)
 (2) ① 0.625 g ($C_{16}H_{19}N_3O_5S$ 0.5 g; $C_8H_9NO_5$ 0.125 g)
 ② 0.3125 g ($C_{16}H_{19}N_3O_5S$ 0.25 g; $C_8H_9NO_5$ 0.0625 g)
 (3) ① 0.457 g ($C_{16}H_{19}N_3O_5S$ 0.4 g; $C_8H_9NO_5$ 0.057 g)
 ② 1.0 g ($C_{16}H_{19}N_3O_5S$ 0.875 g; $C_8H_9NO_5$ 0.125 g)

Storage Preserve in tightly closed containers, stored in a dry, cool and dark place.

Amoxicillin Sodium

$C_{16}H_{18}N_3NaO_5S$ 387.40

[34642-77-8]

Amoxicillin Sodium is sodium (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-amino-2-(4-hydroxy-phenyl) acetyl] amino] 3,3-dimethyl-7-oxo-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate. It contains not less than 80.0% of $C_{16}H_{19}N_3O_5S$, calculated on the anhydrous basis.

Description A white or almost white powder or crystals; odourless or slight odour; taste, slightly bitter; hygroscopic. Freely soluble in water; sparingly soluble in ethanol; insoluble in ether.

Specific optical rotation +240° to +290°, in a solution of 2.5 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak of amoxicillin in the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of amoxicillin CRS in the chromatogram of the reference solution correspondingly.

(2) Yields the flame reaction of sodium salts (Appendix III)

Alkalinity An aqueous solution of 0.1 g per ml, pH 8.0-10.0 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 0.6 g add 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₇ or YG₇ (Appendix IX A method 1).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase A to produce a solution of 2 mg per ml as the test solution; dissolve an accurately weighed quantity of amoxicillin CRS in mobile phase A to produce a solution of 20 μ g per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. A mixture of 0.05 mol/L phosphate buffer solution (0.05 mol/L potassium dihydrogen phosphate solution, adjust the pH with 2 mol/L sodium hydroxide solution to 5.0)-acetonitrile (99 : 1) as mobile phase A; the mobile phase B is 0.05 mol/L phosphate buffer solution (pH 5.0)-acetonitrile (80 : 20). The flow rate is 1 ml per min and detection wavelength is 254 nm. Start the elution isocratically with a mobile phase ratio A : B of 92 : 8, immediately after elution of the amoxicillin peak start the following linear gradient.

Time(min)	Mobile phase A(%)	Mobile phase B(%)
0	92	8
25	0	100
40	0	100
41	92	8
55	92	8

The number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution and record the chromatogram. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than three times the area of the principal peak in the chromatogram obtained with the reference solution (3 percent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than nine times the area of the principal peak in the chromatogram obtained with the reference solution (9 percent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Water Not more than 4.0% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): not more than 0.15 EU per mg of amoxicillin.

Sterility Dissolve a quantity in a suitable solvent, then transfer to not less than 500 ml of 0.9% sterile sodium chloride solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution (adjust the pH with 2 mol/L potassium hydroxide solution to 5.0)-acetonitrile (97.5 : 2.5) as the mobile phase. The flow rate is 1 ml per min. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin.

Procedure Dissolve an accurately weighed quantity in mobile phase and dilute to produce a solution of 0.5 mg per ml. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using amoxicillin CRS instead of the substance being examined. Calculate the content of $C_{16}H_{19}N_3O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation Amoxicillin Sodium for Injection

Amoxicillin Sodium for Injection

Amoxicillin Sodium for Injection is a sterile powder of amoxicillin sodium. It contains not less than 80.0% of amoxicillin ($C_{16}H_{19}N_3O_5S$), calculated on the anhydrous basis. It contains not less than 90.0% and not more than 110.0% of the labelled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$), calculated with reference to the average weight of contents.

Description A white or almost white powder or crystals.

Identification Comply with tests for Identification described under Amoxicillin Sodium.

Alkalinity An aqueous solution of 0.1 g per ml, pH 8.0-10.0 (Appendix VI H).

Clarity and colour of solution Dissolve each of 5 containers

in water to produce solutions of 0.1 g per ml according to the labelled amount, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y_8 or YG_8 (Appendix IX A method 1).

Water Not more than 4.5% (Appendix VIII M, method 1 A).

Related substances, Bacterial endotoxin and Sterility Comply with the corresponding requirements described under Amoxicillin Sodium.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay described under Amoxicillin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Amoxicillin Sodium.

Strength 0.5 g ($C_{16}H_{19}N_3O_5S$)

Storage Preserve in tightly closed containers, protected from light.

Amoxicillin Sodium and Clavulanate Potassium for Injection

Amoxicillin Sodium and Clavulanate Potassium for Injection is a sterile mixture of amoxicillin sodium and clavulanate potassium (5 : 1). It contains not less than 66.0% of Amoxicillin ($C_{16}H_{19}N_3O_5S$) and 13.2% of Clavulanate ($C_8H_9NO_5$) respectively per mg, calculated on the anhydrous basis; It contains not less than 90.0 % and not more than 110.0 % of the labelled amount of amoxicillin ($C_{16}H_{19}N_3O_5S$) and clavulanate ($C_8H_9NO_5$), calculated with reference to the average weight of contents.

Description A white or almost white powder.

Identification The retention time of principal peaks of amoxicillin and clavulanic acid in the substance being examined in the chromatogram obtained in the Assay are identical with that of principal peaks of amoxicillin CRS and clavulanic acid CRS in the chromatogram of the reference solution correspondingly.

Alkalinity An aqueous solution of 100 mg per ml, pH 8.0-10.0 (Appendix VI H).

Clarity and colour of solution Dissolve each of 5 containers in 20 ml of water, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B); any colour produced is not more intense than that of reference solution Y_6 or YG_6 (Appendix IX A, method 1).

Related substances Dissolve an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents in mobile phase A to produce a solution of 2 mg per ml, filter, take the successive filtrate as the test solution; dissolve an accurately weighed quantity of amoxicillin CRS in mobile phase A to produce a solution of 40 μ g per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. The 0.01 mol/L potassium dihydrogen phosphate

solution (pH 6.0) as mobile phase A; the mobile phase B is 0.01 mol/L potassium dihydrogen phosphate solution (pH 6.0)-acetonitrile (20 : 80). The flow rate is 1 ml per min and elute with linear gradient as the following table, detection wavelength is 254 nm. The retention time of amoxicillin is about 10 minutes. The number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution and record the chromatogram. In the chromatogram obtained with the test solution, calculate the contents of impurities of which retention time is longer than that of amoxicillin; the area of any peak, apart from the principal peak, is not more than 2.0%; the sum of the areas of all the peaks, apart from the principal peak, is not more than 5.0%, calculated with reference to the labelled amount of amoxicillin.

Time (min)	Mobile phase A (%)	Mobile phase B (%)
0	95	5
0.5	95	5
30.5	59	41
32	95	5
40	95	5

Water Not more than 4.0 % (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): not more than 0.25 EU per mg.

Sterility Dissolve a quantity in a suitable solvent, then transfer to not less than 500 ml of 0.9 % sterile sodium chloride solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L potassium dihydrogen phosphate solution (adjust the pH with 2 mol/L sodium hydroxide solution to 6.0)-acetonitrile (96 : 4) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 2000 calculated with reference to the peak of amoxicillin.

Procedure Dissolve an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents (equivalent to the content of 1 vial) in water to produce a solution of 1.0 mg of amoxicillin and 0.2 mg of clavulanic acid per ml. Inject 10 μ l of the resulting solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of amoxicillin CRS and clavulanic acid CRS in water to produce a solution of 1.0 mg of amoxicillin and 0.2 mg of clavulanic acid per ml. Repeat the operation and calculate the contents of $C_{16}H_{19}N_3O_5S$ and $C_8H_9NO_5$ with respect to the peak areas obtained in the chromatogram by the external standard method respectively.

Category β -lactam antibiotic, penicillins.

Strength 1.2 g ($C_{16}H_{19}N_3O_5S$ 1 g; $C_8H_9NO_5$ 0.2 g)

Storage Preserve in well closed containers, stored in a dry, cool and dark place.

Amphotericin B

$C_{47}H_{73}NO_{17}$ 924.09

[1397-89-3]

Amphotericin B has a potency of not less than 850 amphotericin B Units per mg, calculated on the dried basis.

Description A yellow to orange yellow powder; odourless or almost odourless; tasteless; hygroscopic; inactivated easily on exposure to sunlight.

Soluble in dimethylsulfoxide; slightly soluble in dimethylformamide; very slightly soluble in methanol; insoluble in water, dehydrated ethanol, chloroform or ether.

Identification (1) Dilute the solution obtained from the test for Amphotericin A with methanol to produce a solution of 5 μ g per ml. It exhibits three maxima at about $362\text{ nm} \pm 2\text{ nm}$, $381\text{ nm} \pm 2\text{ nm}$ and $405\text{ nm} \pm 2\text{ nm}$. The ratio of absorbance at 362 nm to that at 381 nm and the ratio of absorbance at 381 nm to that at 405 nm, is about 0.6 and 0.9 respectively (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amphotericin B (Appendix XVI).

Acidity A suspension of 3% in water, pH 4.0-6.0 (Appendix VI H).

Amphotericin A Dissolve a quantity in a small amount of dimethylsulfoxide, add methanol to produce a solution of 100 μ g per ml. The absorbance at 305 nm is not greater than 0.40 (Appendix IV A).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight at 60°C , loses not more than 5.0% of its weight (Appendix VIII L).

Assay Dissolve an accurately weighed quantity in dimethylsulfoxide, add dimethylformamide to produce a solution of 100 Units per ml, dilute with phosphate BS (pH 10.5) to produce the final solution of 1.4 Units and 0.7 Units per ml respectively. The concentration of dimethylformamide in the final solutions is 8%. Carry out the Microbiological Assay of Antibiotics (Appendix XI A) using 15 ml of inoculated medium instead of base and seed layers. 1000 amphotericin B units are equivalent to 1 mg of $C_{47}H_{73}NO_{17}$.

Category Antifungal.

Storage Preserve in hermetically sealed containers, protected from light and stored in a cold place.

Preparation Amphotericin B for Injection

Amphotericin B for Injection

Amphotericin B for Injection is a sterile lyophilized

mixture of Amphotericin B, sodium deoxycholate and suitable amount of phosphate buffer. It contains not less than 90.0% and not more than 110.0% of the labelled potency of amphotericin B ($C_{47}H_{73}NO_{17}$), calculated with reference to the average weight of contents.

Description A yellow to orange yellow powder.

Identification Dissolve a quantity in a small quantity of water and dilute with methanol to produce a solution containing 5 μ g of amphotericin B per ml. It complies with test (1) for Identification described under Amphotericin B.

Alkalinity Dissolve the content of one container in 5 ml of water, pH 7.2-8.0 (Appendix VI H).

Clarity of Solution Add water to each of 5 containers to produce solutions containing 5 mg of Amphotericin B per ml, the solutions are clear; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight at 60°C, loses not more than 8.0% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 5.0 EU per 1000 amphotericin B units; not more than 0.9 EU per 1000 amphotericin B units for intrathecal injection.

Sterility Dissolve a quantity in a suitable solvent, then transfer to not less than 500 ml of 0.9% sterile sodium chloride solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay described under Amphotericin B, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Amphotericin B.

Strength (1) 5 mg (5000 Units) (2) 25 mg (25000 Units) (3) 50 mg (50000 Units)

Storage Preserve in well closed containers, protected from light and stored in a cold place.

Ampicillin

$C_{16}H_{19}N_3O_4S \cdot 3H_2O$ 403.45

Ampicillin is 6-[D (-)-2-amino-2-phenylacetamido] penicillanic acid trihydrate. It contains not less than 96.0% of Ampicillin ($C_{16}H_{19}N_3O_4S$), calculated on the anhydrous basis.

Description A white, crystalline powder; taste, slightly bitter.

Slightly soluble in water; insoluble in chloroform, ethanol, ether and involatile oils, soluble in dilute solutions of acids or alkali.

Specific optical rotation Dissolve a quantity in water to produce a solution of 2.5 mg per ml by heating on a 60°C water bath and cool, the optical rotation is +280° to +305°, calculated with reference to the anhydrous substance (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Ampicillin (Appendix XVI).

Acidity Dissolve a quantity in water to produce a solution of 2.5 mg per ml by heating on a 60°C water bath and cool. pH is 3.5-5.5 (Appendix VI H).

Clarity of solution Dissolve five portions each of 0.6 g in 5 ml of hydrochloric acid solution (1 mol/L) and dissolve another five portions each of 0.6 g in 5 ml of ammonia hydroxide solution (2 mol/L), observe immediately, the solutions are clear, any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B).

N, N-dimethyl phenylamine Carry out the method for gas chromatography (Appendix V E), using a column packed with 3% silica as the stationary phase, and maintain the column temperature at 120°C. The resolution factor between the peaks of N, N-dimethylphenylamine and the internal standard substance complies with the related requirements.

Internal standard solution Dissolve a quantity of naphthalene, accurately weighed, in hexane to produce a solution of about 50 μ g per ml.

Reference standard solution To 50 mg N, N-dimethylphenylamine, accurately weighed, add 2 ml of hydrochloric acid and 20 ml of water, mix well, dilute with water to 50 ml. Measured accurately 5 ml to 250 ml volumetric flask, dilute to volume with water, mix well.

Procedure To 1.0 g of the substance being examined, accurately weighed, add 5 ml of sodium hydroxide solution (1 mol/L) and 1 ml of internal standard solution accurately measured. Shake thoroughly, allow it to stand. Inject 2 μ l of upper layer into the column, record the peak areas correspondingly obtained in the chromatogram. Repeat the operation, using 1 ml of reference standard solution, accurately measured. Calculate the content of N, N-dimethylphenylamine by the internal standard method. Not more than 0.0020%.

Related substance Dissolve an accurately weighed quantity in mobile phase A to produce a solution of 3 mg per ml as test solution. Measured accurately 1 ml to an 100 ml volumetric flask, dilute with mobile phase A to volume and mix well, as the reference solution. Carry out the method as described under Assay. A mixture of 12% acetic acid solution-0.2 mol/L dihydrogen phosphate potassium solution-acetonitrile-water (0.5 : 50 : 400 : 550) as the mobile phase B, and elute with linear gradient as the following table. The retention time of ampicillin is about 8-10 min. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject 20 μ l separately of the test solution and the reference solution into the column and record the chromatograms. Single peak area other than the principle peak is not more than the peak area of ampicillin in the reference solution (1.0%). The total peak areas other than the principle peak are not more than three times the area of ampicillin in the reference solution (3.0%). (disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference

solution).

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0	85	15
10	85	15
40	0	100
50	0	100
51	85	15
60	85	15

Water 12.0%-15.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.5%, using 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.0020%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D) using a column packed with octadecylsilane bonded silica gel, a mixture of mobile phase A-mobile phase B (described under Related substance) (85 : 15), as the mobile phase. The flow rate is 1.0 ml per minute. Detection wavelength is 254 nm. Dissolve an accurately weighed quantity of ampicillin CRS and cefradine CRS in mobile phase A to produce a mixed solution of 0.3 mg ampicillin per ml and 0.02 mg cefradine per ml. Inject 20 μ l of the solution into the column and record the chromatogram. The resolution factor between the peak of ampicillin and that of the cefradine is not less than 3.0.

Procedure Dissolve an accurately weighed quantity in mobile phase A to produce a solution of 1.0 mg per ml, mix well as the test solution. Inject 20 μ l of the test solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of ampicillin CRS measured as the reference solution. Repeat the operation. Calculate the content of $C_{16}H_{19}N_3O_4S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, stored in a cool place and protected from light.

Ampicillin Sodium

$C_{16}H_{18}N_3NaO_4S$ 371.39

[69-52-3]

Ampicillin Sodium is sodium (2*S*,5*R*,6*R*)-3,3-dimethyl-6[(*R*)-(2-amino-2-phenylacetamido)]-7-oxo-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate. It contains not less than 85.0% of Ampicillin ($C_{16}H_{19}N_3O_4S$), calculated on the anhydrous basis.

Description A white or almost white, crystalline or amorphous powder; odourless or odour slight; taste, slightly bitter; hygroscopic.

Freely soluble in water; sparingly soluble in ethanol; inso-

luble in ether.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of ampicillin RS in the chromatogram of the reference solution correspondingly.

(2) Dissolve 0.25 g in 5 ml of water and add 0.5 ml of acetic acid solution (2 mol/L), mix well. Allow to stand in an ice bath for 10 minutes then filter with a sintered glass filter. Wash the precipitate with 2-3 ml of a mixture of acetone-water (9 : 1) and dry at 60°C for 30 minutes. The infrared spectrum of the dried precipitate (Appendix IV C) is concordant with the reference spectrum of ampicillin trihydrate (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix III).

Alkalinity Dissolve a quantity in water to produce a solution of 0.1 g per ml, pH 8.0-10.0 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 0.6 g add 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Related substance Dissolve an accurately weighed quantity in mobile phase A to produce a solution of 3 mg per ml as the test solution. Measured accurately 1 ml to an 100 ml volumetric flask, add mobile phase A to volume and mix well, as the reference solution. Carry out the method as described under Ampicillin; Dissolve about 0.2 g of the substance being examined in 1.0 ml water, heat on a 60°C water bath for one hour. Measured 0.5 ml to an 50 ml volumetric flask, add mobile phase A to volume, inject 20 μ l of the solution and record the chromatogram. Adjust the retention time of ampicillin to about 8-10 min, the bigger peak with a retention time of 2.8 relative to ampicillin is dimer ampicillin. The peak area of dimer ampicillin is not greater than 4.5 times the area of ampicillin in the reference solution (4.5%). Other single peak area other than the principle peak is not greater than twice the area of ampicillin in the reference solution (2.0%). The total peak areas other than the principle peak are not greater than five times the area of ampicillin in the reference solution (5.0%). (Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution).

Dichloromethane Dilute 1.0 g of dichloromethane, accurately weighed, with water to 500 ml as the internal standard solution; Dilute 1.0 g of dichloromethane, accurately weighed, with water to 500 ml and mix well. To 1 ml of the internal standard solution, add accurately 1 ml of internal standard solution, dilute with water to 10 ml as the reference solution. To about 1.0 g, accurately weighed, add accurately 1 ml of internal standard solution and dilute with water to 10 ml, mix well, as the test solution. Carry out the method for gas chromatography (Appendix V E), using a column packed with 10% macrogol 1000 as the stationary phase, maintain the temperature of the column at 60°C, that of the injection port at 100°C and that of the FID detector at 150°C. Inject separately 20 μ l of the test solution and the reference solution and record the chromatograms. The content of dichloromethane is not more than 0.2%, calculated with respect to the peak area in the chromatogram by external standard method.

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 25 mg per ml in sterile

Water for Injection per kg of the rabbit's weight.

Sterility Dissolve a quantity in a suitable solvent, then transfer to not less than 500 ml of 0.9% sterile sodium solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Assay Dissolve a quantity, accurately weighed, in mobile phase A to produce a solution of about 1 mg per ml as the test solution. Carry out the Assay described under Ampicillin.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation Ampicillin Sodium for Injection

Ampicillin Sodium for Injection

Ampicillin Sodium for Injection is a sterile powder of ampicillin sodium. It contains not less than 85.0% of $C_{16}H_{19}N_3O_4S$, calculated on the anhydrous basis. It contains not less than 95.0% and not more than 105.0% of the labelled amount of Ampicillin ($C_{16}H_{19}N_3O_4S$), calculated with reference to the average weight of contents.

Description A white or almost white, crystalline or amorphous powder.

Identification Complies with the tests for Identification described under Ampicillin Sodium.

Clarity and colour of solution To each of 5 containers, add water to produce solution of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Related substance Carry out the Related substance described under Ampicillin Sodium.

Water Not more than 2.5% (Appendix VIII M, method 1 A).

Alkalinity, Pyrogens and sterility Complies with the requirements described under Ampicillin Sodium.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay described under Ampicillin Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Ampicillin Sodium.

Strength Calculated as $C_{16}H_{19}N_3O_4S$
(1) 0.5 g (2) 1.0 g (3) 2.0 g

Storage Preserve in tightly closed containers, stored in a dry place.

Ampicillin Sodium and Sulbactam Sodium for Injection

Ampicillin Sodium and Sulbactam Sodium for Injection is a sterile powder of ampicillin sodium

and sulbactam sodium. [the labelled amounts representing proportions of ampicillin ($C_{16}H_{19}N_3O_4S$) to sulbactam ($C_8H_{11}NO_5S$) of 2 : 1] It contains not less than 56.3% of ampicillin ($C_{16}H_{19}N_3O_4S$) and 28.0% of sulbactam ($C_8H_{11}NO_5S$) respectively per mg, calculated on the anhydrous basis; It contains not less than 90.0% and not more than 110.0% of the labelled amount of ampicillin ($C_{16}H_{19}N_3O_4S$) and sulbactam ($C_8H_{11}NO_5S$), calculated with the reference to the average weight of contents.

Description A white or almost white powder or crystalline powder.

Identification (1) The retention time of two principal peaks in the substance being examined in the chromatogram obtained in the Assay are identical with that of two principal peaks in the chromatogram of the reference solution correspondingly.

(2) Yields the flame reaction of sodium salts (Appendix III).

Alkalinity An aqueous solution of 10 mg of ampicillin and 5 mg of sulbactam per ml, pH 8.0-10.0 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.15 g per ml according to the labelled amount, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₅ or YG₅ (Appendix IX A method 1).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a test solution containing 3 mg of ampicillin and 1.5 mg of sulbactam per ml. Transfer 1 ml of test solution, measured accurately in a 100 ml volumetric flask, dilute with mobile phase to volume and mix well as reference solution. Carry out the method as described under Assay. Inject 10 μ l of the reference solution into the column. Adjust the attenuation so that the ampicillin peak height in the chromatogram is about 20%-25% of full scale of the chart. Inject accurately 10 μ l of test solution and reference solution respectively into column and record the chromatogram for five times the retention time of the ampicillin peak. The area of any peak other than the principal peak is not greater than one and a half times the sum area of the ampicillin peak and sulbactam peak in the chromatogram obtained with the reference solution (1.5%). The sum of the areas of all peaks other than the principal peak is not greater than two and a half times the sum areas of the ampicillin peak and sulbactam peak in the chromatogram obtained with the reference solution (2.5%). (Disregard any peak with an area less than 0.05 times the sum area of the ampicillin peak and sulbactam peak in the chromatogram obtained with reference solution.)

Water Not more than 2.0% (Appendix VIII M method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.10 EU per mg (containing 0.67 mg of ampicillin and 0.33 mg of sulbactam).

Sterility Dissolve a quantity in a suitable solvent, transfer to not less than 500 ml of sterile 0.9% sodium chloride solution, the solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.02 mol/L sodium dihydrogen phosphate solution (dissolve 2.76 g of sodium dihydrogen phosphate in 950 ml of water, adjust pH value to 4.0 ± 0.1 , dilute to 1000 ml with water and mix well)-acetonitrile (92 : 8) as the mobile phase. The flow rate is about 1 ml per minute. Detection wavelength is 230 nm. The retention time of ampicillin should be over 6 minutes. Dissolve 6 mg of ampicillin CRS and 3 mg of sulbactam CRS respectively in 10 ml of 0.01 mol/L sodium hydroxide solution, allow to stand for 30 minutes, adjust the pH value to 4.0 ± 0.1 with 1 mol/L phosphoric acid solution. Transfer 5 ml of two solution respectively to a 25 ml volumetric flask, add 5 mg of ampicillin CRS and 2.5 mg of sulbactam CRS, dilute to volume with mobile phase and mix well. Inject 10 μ l of the resulting solution into column and record the chromatogram. The resolution factor between the peaks of sulbactam and ampicillin alkaline degradation product complies with the related requirements. The number of theoretical plates of the column calculated with ampicillin is not less than 5000. The elute order is sulbactam alkaline degradation product, sulbactam, ampicillin alkaline degradation product and ampicillin.

Procedure Dissolve an accurately weighed quantity of the mixed contents, obtained in the test for weight variation of contents in mobile phase to produce a test solution containing 0.6 mg of ampicillin and 0.3 mg of sulbactam per ml. Dissolve an accurately weighed quantity of ampicillin CRS and sulbactam CRS in mobile phase to produce a reference solution of 0.6 mg of ampicillin and 0.3 mg of sulbactam per ml respectively. Inject separately 10 μ l each of the resulting solutions into the column and record the chromatogram. Calculate the content of $C_{16}H_{19}N_3O_4S$ and $C_8H_{11}NO_5S$ with respect to the peak area obtained in the chromatogram by the external standard method respectively.

Category β -Lactam Antibiotic.

Strength (1) 0.75 g ($C_{16}H_{19}N_3O_4S$ 0.5 g; $C_8H_{11}NO_5S$ 0.25 g)
(2) 1.50 g ($C_{16}H_{19}N_3O_4S$ 1.0 g; $C_8H_{11}NO_5S$ 0.5 g)

Storage Preserve in well closed containers, stored in a dry, cool and dark place.

Amrinone

$C_{10}H_9N_3O$ 187.20

[60719-84-8]

Amrinone is 5-Amino-[3,4'-bipyridin]-6 (1H)-one. It contains not less than 98.5% of $C_{10}H_9N_3O$, calculated on the dried basis.

Description Pale yellow or pale yellowish brown needle crystals or a crystalline powder; odourless; tasteless; gradually darkening on exposure to light. Slightly soluble in methanol; very slightly soluble in ethanol; practically insoluble in water; soluble in lactic acid.

Identification (1) Dissolve about 5 mg in 5 ml of 0.1 mol/L

L hydrochloric acid solution, add 1 ml of trinitrophenol TS, a yellow precipitate is produced.

(2) The light absorption of a solution of 5 μ g per ml in 0.1 mol/L hydrochloric acid solution exhibits a maximum at 317 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of amrinone (Appendix XVI).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-0.01 mol/L potassium dihydrogen phosphate solution (adjust to pH 6.2 ± 0.05 with 1 mol/L potassium hydroxide solution)(100 : 50 : 850) as the mobile phase. Detection wavelength is 274 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of amrinone. The resolution factor among the peaks complies with related requirements. Sonicate to dissolve about 25 mg, accurately weighed, in 2 ml of 0.1 mol/L hydrochloric acid solution in a 50 ml volumetric flask, allow to cool, dilute with the mobile phase to volume and mix well as the test solution. Accurately measure 1 ml of the test solution into a 100 ml volumetric flask, dilute to volume with mobile phase and mix well as the reference solution. Inject 20 μ l of the reference solution. Adjust the attenuation so that the principal peak height in the chromatogram is 10%-25% of the full scale of the chart. Inject separately 20 μ l of each of the test solution and the reference solution into the column and record the chromatogram for five times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Sterility Complies with the test for sterility (Appendix XI H).

Assay Dissolve about 0.35 g, accurately weighed, in 70 ml of hydrochloric acid solution (20 \rightarrow 70). Carry out the method for potentiometric titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 18.72 mg of $C_{10}H_9N_3O$.

Category Cardiotonic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Amrinone for Injection

Amrinone for Injection

Amrinone for injection is a sterile powder or crystals. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Amrinone ($C_{10}H_9N_3O$).

Description Pale yellow or pale yellowish brown needle crystals or a crystalline powder.

Identification Complies with tests (1) and (2) for Identification described under Amrinone.

Acidity Dissolve the content of 1 container in 1 ampoule of Solvent for Amrinone for Injection, add water to produce a solution of 5 mg per ml, pH 3.2-4.0 (Appendix VI H).

Clarity of solution Dissolve the content of 1 container in 1 ampoule of Solvent for Amrinone for Injection, the reconstituted solution is clear (Appendix IX B).

Related substances Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents, proceed as describe for related substances under Amrinone. The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Sterility Dissolve the contents of 1 container in 1 ampoule of Solvent for Amrinone for Injection, the reconstituted solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Pyrogens Dissolve the contents of 2 containers in 2 ampoules of Solvent for Amrinone for Injection separately, add Sodium Chloride Injection to produce a solution of 1.5 mg per ml. Complies with the test for pyrogens (Appendix XI D), using 5 ml per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 25 mg amrinone into a 100 ml volumetric flask, add a quantity of 0.1 mol/L hydrochloride acid solution, shake to dissolve amrinone, dilute with 0.1 mol/L hydrochloride acid solution to volume and mix well. Transfer 2 ml, accurately measured, to a 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloride acid solution to volume and mix well. Dissolve a quantity of amrinone CRS, accurately weighed, in 0.1 mol/L hydrochloride acid solution to produce a solution 5 µg per ml. Measure the absorbance of the two solutions at 317 nm (Appendix IV A), calculate the content of $C_{10}H_9N_3O$.

Category As described under amrinone.

Strength 50 mg

Storage Preserve in well closed containers, protected from light.

Note: Solvent for Amrinone for Injection

Solvent for Amrinone for Injection is a sterile solution of lactic acid. It contains not less than 90.0% and not more than 110.0% of the labelled amount of lactic acid ($C_3H_6O_3$).

Description A colourless clear liquid.

Identification When warmed with potassium permanganate TS, yields acetaldehyde, recognisable by its odour.

pH 2.2-2.5 (Appendix VI H).

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Accurately measure 50 ml, add 10 ml of water and mix well. Add 25 ml of sodium hydroxide (1 mol/L) VS, accurately measured, boil for 5 minutes, add 2 drops of phenolphthalein IS, titrate while hot with sulfuric acid (0.5 mol/L) VS until the solution becomes colourless. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 90.08 mg of $C_3H_6O_3$.

Strength 5 ml : 80 mg

Storage Preserve in well closed container.

Anaesthetic Ether

$C_4H_{10}O$ 74.12

[60-29-7]

Anaesthetic Ether may contain a suitable stabilizer.

Description A colourless, clear, very mobile liquid; odour, characteristic; taste, burning and slightly sweet. Highly volatile and flammable; mixture of its vapour with air is explosive on exposure to fire; deteriorated slowly on exposure to air and light.

Miscible freely with ethanol, chloroform, benzene, petroleum ether, fatty oils or volatile oils; soluble in water.

Relative density 0.713-0.718 (Appendix VI A, hydrostatic method).

Boiling range 33.5-35.5°C (Appendix VI B), it distils within a range of 1°C (Do not distil if the substance to be examined does not comply with the test for peroxides).

Acidity To 10 ml of water add 2 drops of bromothymol blue IS. Add sodium hydroxide (0.02 mol/L) VS dropwise and shake until a blue colour is developed; then add 25 ml of the substance being examined, stopper and shake well, add 0.30 ml of sodium hydroxide (0.02 mol/L) VS, shake well, the blue colour does not disappear in the aqueous layer.

Aldehyde Transfer 50 ml to a 100 ml distilling flask, distil on a water bath below 40°C, until only 1-2 ml remains. Measure 10 ml of the distillate into a stoppered conical flask containing 100 ml of water, add 1 ml of 0.1% sodium bisulfite solution, insert the stopper and shake vigorously for 10 seconds. Allow it to stand in a cool and dark place for 30 minutes, add 2 ml of starch IS, titrate with iodine (0.01 mol/L) VS until the solution becomes slight blue. Maintain the temperature of the solution below 18°C, add 2 g of sodium bicarbonate, shake well, until the blue colour disappears, add 1.0 ml of dilute iodine solution [dilute 9 ml of iodine (0.01 mol/L) VS with water to 40 ml], the blue colour reappears in aqueous layer.

Peroxide Place 5 ml in a stoppered colour comparison tube of less than 15 ml in capacity, add 8 ml of freshly prepared potassium iodide and starch solution (dissolve 10 g of potassium iodide in water and dilute to 95 ml, add 5 ml of starch IS and mix). Insert the stopper, shake vigorously for 1 minute and allow to stand in the dark for 30 minutes; no colour is produced in either of the layers.

Foreign odour Transfer 10 ml to an evaporating dish, allow to evaporate spontaneously to dryness, no foreign odour is perceptible.

Non-volatile matter This test should be done after ensure that the substance being examined complies with the test for peroxides. Pour 50 ml in a tared evaporating dish,

evaporate to dryness by air or on gentle warming, then dried to constant weight at 105°C, the residue weighs not more than 1 mg.

Category General anaesthetics by inhalation.

Storage Preserve in hermetically containers, Almost full-filled, protected from light, and fire, stored in a cool place. After stored for 2 years, it must be reexamined and proved to be in compliance with all requirements.

Anhydrous Glucose

$C_6H_{12}O_6$ 180.16

[228-44-6]

Anhydrous Glucose is D-(+)-glucopyranose.

Description Colourless crystals or a white crystalline powder; odourless; taste, sweet.

Freely soluble in water; slightly soluble in ethanol.

Specific optical rotation Dissolve about 10 g, weighed accurately, with a quantity of water and 2.0 ml of ammonia TS in a 50 ml volumetric flask and dilute with water to volume. Mix well and allow to stand for 60 minutes. The specific optical rotation of the resulting solution is +52.6°—+53.2° at 25°C (Appendix VI E).

Identification (1) Dissolve about 0.2 g in 5 ml of water, add dropwise to hot alkaline cupric tartrate TS; a red precipitate of cuprous oxide is formed.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of anhydrous glucose (Appendix XVI).

Acidity Dissolve 2.0 g in 20 ml of water, add 3 drops of phenolphthalein IS and 0.20 ml of sodium hydroxide (0.02 mol/L) VS; a pink colour is produced.

Clarity and colour of solution Dissolve 5.0 g in hot water, cool, dilute to 10 ml with water; the solution is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B). Any colour produced is not more pronounced than that of a solution prepared by diluting 1.0 ml of a reference solution (mix 3 ml of standard cobaltous chloride CS and 3 ml of standard potassium dichromate CS with 6 ml of standard copper sulfate CS and add sufficient water to produce 50 ml) with water to 10 ml.

Clarity of ethanolic solution To 1.0 g add 20 ml of ethanol and reflux on a water bath for about 40 minutes; the solution is clear.

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.60 g. Any opalescence produced is not more pronounced than that of a reference using 6.0 ml of sodium chloride standard solution (0.01%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 2.0 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.01%).

Sulfites and soluble starch Dissolve 1.0 g in 10 ml of water, add 1 drop of iodine TS; a yellow colour is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Protein Dissolve 1.0 g in 10 ml of water, add 3 ml of sulfosalicylic acid solution (1→5), no tribidity or precipitate is produced.

Barium Dissolve 2.0 g in 20 ml of water, and divide the solution into two equal portions. To one portion add 1 ml of dilute sulfuric acid and to the other add 1 ml of water, mix well, allow to stand for 15 minutes, both portions are equally clear.

Calcium Dissolve 1.0 g in 10 ml of water, add 1 ml of ammonia TS and 5 ml of ammonium oxalate TS, mix well and allow to stand for 1 hour. Any opalescence produced is not more pronounced than that of a reference using 1.0 ml of calcium standard solution (weigh accurately 0.1250 g of calcium carbonate to 500 ml volumetric flask, add 5 ml of water and 0.5 ml of hydrochloric acid to dissolve and dilute with water to volume, mix well; each ml is equivalent to 0.10 mg of Ca) (0.01%).

Iron Dissolve 2.0 g in 20 ml of water, add 3 drops of nitric acid, boil gently for 5 minutes. Allow to cool, dilute to 45 ml with water, add 3 ml of ammonium thiocyanate solution (30→100) and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 2.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 5.0 g in 23 ml of water, add 2 ml of sodium acetate BS (pH 3.5), carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0004%.

Arsenic Dissolve 2.0 g in 5 ml of water, add 5 ml of dilute sulfuric acid and 0.5 ml of bromine-potassium bromide TS. Heat on a water bath for about 20 minutes, maintain the presence of excess of bromine. Add a quantity of bromine-potassium bromide TS if necessary, replace the evaporated water constantly. Cool, then add 5 ml of hydrochloric acid and dilute with water to 28 ml. The solution complies with the limit test for arsenic (Appendix VIII J, method 1) (0.0001%).

Category Nutrient.

Storage Preserve in tightly closed containers.

Preparation (1) Compound Sodium Lactate and Glucose Injection
(2) Glucose Injection
(3) Glucose and Sodium Chloride Injection

Anisodamine Hydrobromide

$C_{17}H_{23}NO_4 \cdot HBr$ 386.29

Anisodamine Hydrobromide is the hydrobromide of an alkaloid [6β-hydroxy-1αH, 5αH-tropane-3α-ol

(±) tropiate] isolated from the root of *Scopolia tangutica* Maxim. (Solanaceae). It contains not less than 98.5% of $C_{17}H_{23}NO_4 \cdot HBr$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless. Very soluble in water; freely soluble in ethanol; slightly soluble in acetone.

Melting range 176-181°C (Appendix VI C).

Specific optical rotation -9.0° to -11.5° , in a solution of 0.1 g per ml in water (Appendix VI E).

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of anisodamine hydrobromide (Appendix XVI).

(2) Yields the reactions characteristic of tropane alkaloids (Appendix III).

(3) The aqueous solution yields the reactions characteristic of bromides (Appendix III).

Acidity Dissolve 0.50 g in 15 ml of water, add 1 drop of methyl red IS, if a red colour produced, becomes yellow on the addition of 0.3 ml of sodium hydroxide (0.02 mol/L) VS.

Other alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using neutral aluminium oxide (activity grade II-III) as the coating substance and a mixture of chloroform-dehydrated ethanol (95 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 10 mg per ml of anisodamine hydrobromide CRS, (2) 10 mg per ml of the substance being examined. After developing and removal of the plate, spray with a mixture of dilute potassium iodobismuthate TS-potassium iodide TS (1 : 1). No spot in the chromatogram obtained with solution (2) is observed other than the spot similar in position and colour to that of the principal spot in the chromatogram obtained with solution (1).

Loss on drying When dried to constant weight at 120°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, heat gently if necessary, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 38.63 mg of $C_{17}H_{23}NO_4 \cdot HBr$.

Category Anticholinergic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Anisodamine Hydrobromide Injection
(2) Anisodamine Hydrobromide Tablets

Anisodamine Hydrobromide Injection

Anisodamine Hydrobromide Injection is a sterile solution of anisodamine hydrobromide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of anisodamine hydrobromide ($C_{17}H_{23}NO_4 \cdot HBr$).

Description A clear, colourless liquid.

Identification (1) Carry out the test for Other alkaloids described under Anisodamine Hydrobromide, using the residue obtained on evaporating 1 ml of the injection to dryness. The colour and position of the principal spot

obtained with solution (2) are identical to those of the principal spot obtained with solution (1).

(2) Evaporate 1 ml to dryness on a water bath, the residue yields the reactions characteristic of tropane alkaloids (Appendix III).

(3) Yields the reactions characteristic of bromides (Appendix III).

pH value 3.5-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity of the injection with water to produce a solution of about 70 μ g per ml, as test solution. Dilute an accurately weighed quantity of anisodamine hydrobromide CRS with water to produce a solution of about 70 μ g per ml, as reference solution. Accurately measure 3 ml of each of test solution and reference solution, to two separators with 15 ml of chloroform separately, add 6.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green and 1.021 g of potassium hydrogen phthalate in 1.6 ml of 0.2 mol/L hydrochloric acid solution, dilute with water to 100 ml, shake well and filter, if necessary] respectively, shake for 3 minutes and allow it to stand until separation takes place. Separate the chloroform layer and measure its absorbance at 420 nm (Appendix IV A). Calculate the content of $C_{17}H_{23}NO_4 \cdot HBr$.

Category As described under Anisodamine Hydrobromide.

Strength (1) 1 ml : 10 mg (2) 1 ml : 20 mg

Storage Preserve in well closed containers, protected from light.

Anisodamine Hydrobromide Tablets

Anisodamine Hydrobromide Tablets contain not less than 95.0% and not more than 115.0% of the labelled amount of anisodamine hydrobromide ($C_{17}H_{23}NO_4 \cdot HBr$).

Description White tablets

Identification (1) Stir a quantity of the powdered tablets equivalent to 10 mg of anisodamine hydrobromide with 5 ml of ethanol, filter and evaporate the filtrate to dryness on a water bath. The residue yields the reactions characteristic of tropane alkaloids (Appendix III).

(2) Stir a quantity of the powder with water and filter. The filtrate yields the reactions characteristic of bromides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder, equivalent to 7 mg of anisodamine hydrobromide, to a 100 ml volumetric flask, add water to dissolve the anisodamine hydrobromide, dilute to volume, shake well and filter, using the filtrate as the test solution. Dissolve an accurately weighed quantity of anisodamine hydrobromide CRS with water to produce a solution containing about 70 μ g of anisodamine hydrobromide, as the reference solution. To 3 ml of each of the test solution and the reference solution, accurately measured, with 15 ml of chloroform separately in separators, add 6.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green and 1.021 g of potassium hydrogen phthalate in 1.6 ml of (0.2 mol/L) hydrochloric acid solution, dilute with water to 100 ml, shake well and filter, if necessary] respectively, shake for 3

minutes and allow it to stand until separation takes place. Separate the chloroform layer and measure its absorbance at 420 nm (Appendix IV A). Calculate the content of $C_{17}H_{23}NO_4 \cdot HBr$.

Category As described under Anisodamine Hydrobromide.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Antazoline Hydrochloride

$C_{17}H_{19}N_3 \cdot HCl$ 301.8 [154-68-7] (phosphate)

Antazoline Hydrochloride is 4, 5-dihydro-*N*-phenyl-*N*-(phenylmethyl)-1*H*-imidazole-2-methanamine hydrochloride. It contains not less than 98.0% of $C_{17}H_{19}N_3 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or almost odourless; taste, bitter. Soluble in ethanol; sparingly soluble in water; slightly soluble in chloroform; practically insoluble in ether.

Melting range 238-243°C, with decomposition (Appendix VI C).

Identification (1) To about 50 mg add 5 ml of water and 0.5 ml nitric acid, a red colour is produced and turns to dark green immediately.

(2) The light absorption of a solution of 20 µg per ml in hydrochloric acid (0.1 mol/L) exhibits two maxima at 241 nm and 291 nm; the absorbance are about 1.0 and 0.13, respectively (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of antazoline hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 100 ml of water, pH 5.0-6.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay To about 0.2 g, accurately weighted, add 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of 0.1 mol/L VS is equivalent to 30.18 mg of $C_{17}H_{19}N_3 \cdot HCl$.

Category Antihistaminic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Antazoline Hydrochloride Tablets

Antazoline Hydrochloride Tablets

Antazoline Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of antazoline hydrochloride ($C_{17}H_{19}N_3 \cdot HCl$).

Description White tablets.

Identification (1) Shake a quantity of the powdered tablets equivalent to about 50 mg of antazoline hydrochloride with 5 ml of water to dissolve antazoline hydrochloride, add 1 ml of sodium hydroxide TS and shake. Extract with 25 ml of chloroform, evaporate the chloroform layer to dryness on a water bath. Dissolve the residue in 0.2 ml of hydrochloric acid, add 5 ml of water and 0.5 ml of nitric acid, a red colour is produced and turns to dark green rapidly.

(2) The light absorption of the solution obtained in the Assay exhibits two maxima at 241 nm and 291 nm (Appendix IV A).

(3) Shake a quantity of the powdered tablets with water and filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Accurately weigh a quantity of the powdered tablets equivalent to about 0.1 g of antazoline hydrochloride to a 200 ml volumetric flask, add 160 ml of 0.1 mol/L hydrochloric acid solution, shake, warm to dissolve the antazoline hydrochloride, allow to cool, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well and filter. Transfer 2 ml of the filtrate, accurately measured, to a 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume. Measure the absorbance of the resulting solution at 241 nm (Appendix IV A). Repeat the operation, using a solution of 10 µg per ml of antazoline hydrochloride CRS in 0.1 mol/L hydrochloric acid solution. Calculate the content of $C_{17}H_{19}N_3 \cdot HCl$.

Category As described under Antazoline Hydrochloride.

Strength 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Apomorphine Hydrochloride

$C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$ 312.80 [1372-20-7]

Apomorphine Hydrochloride is (*R*)-5,6,6α,7-tetrahydro-6-methyl-4*H*-dibenzo[*de,g*]quinoline-10,11-diol hydrochloride hemihydrate. It contains not less than 98.0% of $C_{17}H_{17}NO_2 \cdot HCl$, calculated on the dried basis.

Description White or greyish white lustrous crystals or a crystalline powder; odourless; it changes to green on exposure to air or light.

Soluble in hot water; sparingly soluble in water or ethanol; very slightly soluble in chloroform or ether.

Identification (1) To 10 mg add 1 ml of nitric acid, a solution with dark purple colour is produced.

(2) Dissolve 50 mg in 5 ml of water, add 1 ml of sodium bicarbonate TS, a white or greenish white precipitate is produced; which becomes emerald-green gradually on adding 3 drops of iodine TS and shaking vigorously. Shake the mixture vigorously with 5 ml ether and allow to stand, the ether layer becomes ruby-red, while the water layer remains green in colour.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of apomorphine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reaction characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 3.0-4.0 (Appendix VI H).

Colour of solution A solution of 0.10 g in 10 ml of freshly boiled and cooled water is not more intensely coloured than the reference solution [Dissolve 5 mg in 100 ml of freshly boiled and cooled water. To 1 ml of the solution in a test tube add 6 ml of freshly boiled and cooled water, 1 ml of sodium bicarbonate TS and 0.5 ml of iodine solution (0.05 mol/L); allow to stand for 30 seconds, add 0.6 ml of sodium thiosulfate solution (0.1 mol/L) and dilute to 10 ml with freshly boiled and cooled water].

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.04 mol/L potassium dihydrogen phosphate solution (adjust the pH Value to 3.0 with phosphonic acid.) (20 : 80) as the mobile phase. Detection wavelength is at 212 nm, and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of apomorphine hydrochloride. Add a quantity equivalent to about 20 mg of anhydrous apomorphine hydrochloride to 100 ml volumetric flask, dilute with mobile phase to the volume, mix well, use as the test solution. Measure accurately 1 ml of above solution to 100 ml volumetric flask and dilute with mobile phase to the volume as the reference solution. Inject 20 μ l of the reference solution into the column, accurately measured, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 20 μ l each of the test and reference solution, both accurately measured, into the column and record the chromatogram for twice the retention time of the principal peak. The sum of peak areas due to impurities is not greater than twice the area of the principal peak of the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.25 g, accurately weighed, in 20 ml of glacial acetic acid and 6 ml of mercuric acetate TS, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 30.38 mg of $C_{17}H_{17}NO_2 \cdot HCl$.

Category Vomiting agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Apomorphine Hydrochloride Injection

Apomorphine Hydrochloride Injection

Apomorphine Hydrochloride Injection is a sterile solution of apomorphine hydrochloride in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of apomorphine hydrochloride ($C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$). It may contain suitable stabilizers.

Description A clear, colourless to pale yellowish-green liquid; turning to green on exposure to light.

Identification (1) To 1 ml add 1 ml of sodium bicarbonate TS, a white or greenish-white precipitate is produced; add iodine TS dropwise slowly and shake, the precipitate becomes emerald-green; add 2 ml of ether, shake vigorously and allow the mixture to stand, the ether layer becomes ruby-red, while the water layer remains green in colour.

(2) Yields the reactions characteristic of chlorides (Appendix III).

pH value 2.5-4.0 (Appendix VI H).

Colour Not more intense than reference solution YG₃ (Appendix IX A, method 1).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Measure accurately a volume equivalent to about 50 mg of apomorphine hydrochloride into a separator, dilute with freshly boiled and cooled water to 25 ml. Add 0.5 g of sodium bicarbonate, shake and extract with 25 ml of peroxide-free ether and then with four 15 ml portions of peroxide-free ether. Combine the ether extracts and wash 3 times with 5 ml each of water. Combine the washings and extract with 5 ml of peroxide-free ether. Combine the ether extracts, add 20 ml of hydrochloric acid (0.02 mol/L) VS, accurately measured, shake vigorously and allow to stand. Separate the acid layer and wash the ether layer with 5 ml each of water for 2 times. Combine the washings and the acid extract, add 1-2 drops of methyl red IS, titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of hydrochloric acid (0.02 mol/L) VS is equivalent to 6.256 mg of $C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$.

Category As described under Apomorphine Hydrochloride.

Strength 1 ml : 5 mg

Storage Preserve in well closed containers, protected from light.

Aprotinin

Aprotinin is the proteolytic enzymes inhibitor obtained by extraction and purification from bovine pancreas or lung. It contains not less than 3.0 Units per mg, calculated on the dried basis.

Description A white to slightly yellow powder.

Freely soluble in water or 0.9% sodium chloride solution; insoluble in ethanol, acetone or ether.

Identification Dissolve a quantity of the substance being examined and trypsin in water to produce solutions of 1 mg

per ml respectively. Transfer 10 μ l of each solution to a separate depression on a white spot plate, mix well, add 0.2 ml of methyl *n*-tosyl-L-arginate hydrochloride TS. Allow it to stand for a few minutes, no purple colour is produced. Treat 10 μ l of trypsin solution in the same manner, a purple colour is produced.

Acidity An aqueous solution of 5 mg per ml, pH 5.0-7.0 (Appendix VI H).

Clarity of solution An aqueous solution of 2 mg per ml is clear.

Absorbance The light absorption of a solution of 3.0 units per ml in water exhibits a maximum at 277 nm and the absorbance is not more than 0.8 (Appendix IV A).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Proteins impurities of higher molecular mass Dissolve a quantity of the substance being examined in 3 mol/L acetic acid solution to produce a solution of 300 units per ml. Carry out the method for column chromatography (Appendix V C), using a column (80-100 cm \times 2.5 cm) packed with about 50 g of glucosan gel G-50 (type of ultra-fine) and 3 mol/L acetic acid solution as the eluent with a flow rate 22-25 ml per hour. Detection wavelength is 277 nm. Inject 1.0 ml of the resulting solution into the column. The sum of the areas of all the peaks eluting before the principal peak is not more than 3.0% of the total area of the peaks.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 15 Units per ml in sterile Water for Injection or Sodium Chloride Injection per kg of the rabbit's weight.

Undue toxicity Complies with the test for Undue toxicity (Appendix XI C), using a solution of 4 Units per ml in sterile Water for Injection or Sodium Chloride Injection, injected intravenously.

Depressor substances Complies with the test for depressor substances (Appendix XI G), using 1.5 Units per kg of the cat's weight.

Assay Substrate solution Dissolve 171.3 mg of ethyl *N*-benzoyl-L-arginate hydrochloride in water and dilute to 25 ml. Freshly prepared before use.

Trypsin CRS solution Dissolve a quantity of Trypsin CRS, accurately weighed, in hydrochloric acid solution (0.001 mol/L) to produce a solution of about 0.8 Units per ml (equivalent to about 1 mg per ml). Freshly prepared before use, stored in an ice bath.

Dilute trypsin CRS solution Dilute 1 ml of trypsin CRS solution, accurately measured, with borax-calcium chloride BS (pH 8.0) to 20 ml, stand at room temperature for 10 minutes, stored in an ice bath.

Test solution To a quantity, accurately weighed, add borax-calcium chloride BS (pH 8.0) to produce a solution of about 1.67 Units per ml (equivalent to about 0.6 mg per ml). Dilute 0.5 ml of the solution and 2 ml of trypsin CRS solution, both accurately measured, with borax-calcium chloride BS (pH 8.0) to 20 ml. Allow it to react for 10 minutes, stored in an ice bath (use within two hours).

Procedure Transfer 9.0 ml of borax-calcium chloride BS (pH 8.0) and 1.0 ml of the substrate solution to a 25 ml beaker, kept at $25^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$ for 3-5 minutes in a water bath. Adjust to pH 8.0 by the addition of sodium hydroxide solution (0.1 mol/L) dropwise with stirring, add 1 ml of the test solution (kept at 25°C for 3-5 minutes) and start a timer immediately. Titrate the liberated acid with sodium hydroxide (0.1 mol/L) VS by a 1 ml microburette to keep the solution maintaining at pH 7.9-8.1. Read the consumed

volume of sodium hydroxide (0.1 mol/L) VS at pH 8.0 in an interval of 1 minute for a period of 6 minutes. Repeat the operation using 1 ml of dilute trypsin CRS solution as reference test. Plot a graph with time as abscissa and the consumed volume of sodium hydroxide solution in ml as ordinate, a linear line is obtained. The two lines should coincide almostly. Calculate the volume in ml of sodium hydroxide (0.1 mol/L) VS consumed per minute and the activity from the following expression:

$$\text{Activity in Units of aprotinin per mg} = \frac{(2 n_1 - n_2) 4000 f}{W}$$

where 4000 is coefficient;

W is the quantity in mg of aprotinin at the concentration of about 1.67 Units per ml;

n_1 is the volume in ml of sodium hydroxide (0.1 mol/L) VS consumed per minute by the dilute trypsin CRS solution;

n_2 is the volume in ml of sodium hydroxide (0.1 mol/L) VS consumed per minute by the test solution;

2 means the quantity of trypsin in test solution is twice as much as reference test;

f is the correction factor of sodium hydroxide (0.1 mol/L) VS.

Definition of Activity in Units 1 aprotinin activity Unit (E. P. U) represents its inhibitory action on the activity of 1 trypsin Unit (1 trypsin Unit represents the activity to hydrolyse 1 μ mol of ethyl *N*-benzoyl-L-arginate per second). The activity of aprotinin is determined by measuring its inhibitory action on a solution of trypsin of known activity. The activity unit of the aprotinin is calculated from the difference between the initial activity and the residual activity of the trypsin.

Category Proteolytic enzyme inhibitor.

Storage Preserve in hermetically sealed containers, protected from light.

Preparation Aprotinin for Injection

Aprotinin for Injection

Aprotinin for Injection is sterile, lyophilized aprotinin. It contains not less than 85.0% of the labelled amount of aprotinin.

Description A white or almost white lyophilized mass or powder.

Freely soluble in water.

Identification A solution of 3 Units per ml in water complies with tests for Identification described under Aprotinin.

Acidity Dissolve the content of 1 container with 2 ml of water, pH 5.0-7.0 (Appendix VI H).

Colour of solution A solution of 6 Units per ml in water is colourless; any colour produced is not more intense than that of the reference solution Y₂ (Appendix IX A).

Water Not more than 7.0% (Appendix VIII M, method 1 A).

Pyrogens, Depressor substances Complies with the corresponding tests described under Aprotinin.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 3 containers separately with 2 ml of borax-calcium chloride BS (pH 8.0). Combine the

solutions and mix well. Dilute a quantity, accurately measured, equivalent to about 33.4 Units of aprotinin with borax-calcium chloride BS (pH 8.0) to 20 ml. Dilute 0.5 ml of the solution and 2 ml of trypsin CRS solution, both accurately measured, to 20 ml. Allow the reaction to proceed for 10 minutes and carry out Assay described under Aprotinin immediately, calculate the content of aprotinin.

Category As described under Aprotinin.

Strength (1) 28 Units (2) 56 Units (3) 278 Units

Storage Preserve in hermetically sealed containers, protected from light and stored in a cool place.

Arginine

$C_6H_{14}N_4O_2$ 174.20

Arginine is L-2-Amino-5-guanidopentanoic acid. It contains not less than 99.0% of $C_6H_{14}N_4O_2$, calculated on the dried basis.

Description A white crystals or crystalline powder; almost odourless; taste, characteristic. Freely soluble in water, very slightly soluble in ethanol.

Specific optical rotation +26.9° to +27.9°, in a solution of 80 mg per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of arginine (Appendix X VI).

Alkalinity Dissolve 2.5 g in 25 ml of water, pH 10.5-12.0 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 10 ml of water, measure the transmittance at 430 nm (Appendix IV A), not less than 98.0%.

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.3 g. Any opalescence produced is not more pronounced than that of a reference solution, using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Proteins Dissolve 1 g in 10 ml of water, add 5 drops of 20% trifluoroacetic acid, no precipitate is produced.

Other amino acids Dissolve a quantity of arginine in water to produce a solution of 100 mg per ml as test solution, measured accurately 0.4 ml of the test solution into a 100 ml volumetric flask, dilute with water to the volume, mix well, use the solution as reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of n-propanol and concentrated ammonia solution (66 : 37) as the mobile phase. Apply separately to the plate 1 µl each of above two solutions, after developing and removal of the plate, dry it

in air, then heat at 90°C for 10 minutes, cool and spray with a solution of 1% ninhydrin in n-propanol, heat at 90°C until the colour changes and examine immediately. The spots apart from the principal spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution (0.4%).

Loss on drying When dried to constant weight at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G). Using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 1.0 g in 23 ml of water and 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml of a solution of 50 mg per ml in sodium chloride for injection per kg of rabbit's weight.

Assay Dissolve about 80 mg, accurately weighed, in 3 ml of anhydrous formic acid, add 50 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A). Titration with perchloric acid (0.1 mol/L) VS, perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 8.710 mg of $C_6H_{14}N_4O_2$.

Category Amino acid.

Storage Preserve in well closed containers.

Preparation Arginine Hydrochloride Injection

Arginine Hydrochloride

$C_6H_{14}N_4O_2 \cdot HCl$ 210.66

Arginine Hydrochloride is L-2-amino-5-guanidopentanoic acid hydrochloride. It contains not less than 98.5% of $C_6H_{14}N_4O_2 \cdot HCl$, calculated on the dried basis.

Description A white, crystalline powder; the aqueous solution exhibits acid reaction.

Freely soluble in water; very slightly soluble in ethanol.

Specific optical rotation +21.5°-+23.5°, in a solution of 80 mg per ml in hydrochloric acid solution (6 mol/L) (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of arginine hydrochloride (Appendix XVI).

Transmittance of solution Dissolve 1 g in 10 ml of water, measure the transmittance at 430 nm (Appendix IV A); not less than 98.0%.

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 0.5 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.02%).

Phosphates To 0.4 g add 0.3 g of magnesium nitrate and 5 ml of water in a crucible, evaporate to dryness on a water bath and then ignite gently until incineration is complete. Add 5 ml of water and 3 ml of sulfuric acid solution (1→4) to the residue and heat gently for 5 minutes. Add 10 ml of hot water, filter and wash the residue with a quantity of hot water. Combine the filtrate and the washings in a 25 ml Neesler cylinder and dilute to volume with water. Add 1 ml of ammonium molybdate solution [dissolve 0.5 g of ammonium molybdate in 10 ml of sulfuric acid solution (3→100)] and 1 ml of phosphorus TS. Heat the solution at 60°C for 10 minutes, a blue colour produced is not more intense than that of a reference solution prepared in the same manner using 0.8 ml of phosphate standard solution (dissolve 0.143 g of potassium dihydrogen phosphate, accurately weighed, in water to produce 1000 ml) (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.1 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Protein Dissolve 1 g in 10 ml of water, add 5 drops of 20% trichloroacetic acid solution, no precipitate is produced.

Other amino acid Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-propanol-concentrated ammonia solution (2 : 1) as the mobile phase. Apply to the plate 1 µl of a 10 mg per ml solution in water. After developing and removal of the plate, dry it in air, then heat at 105°C for 10 minutes and allow to cool. Spray with a 1% solution of ninhydrin in methanol containing 3% (ml/ml) of acetic acid, heat at 105°C until the colour is produced and examine immediately. No spot other than the principal spot is observed.

Loss on drying When dried to constant weight at 105 °C for 3 hours, loses not more than 0.20% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), using 2.0 g. Any colour produced is not more intense than that of a reference solution, using 2.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 2.0 g in 23 ml of water and 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0010%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml of a solution of 50 mg per ml in sterile Water for Injection per kg of rabbit's weight (for injection).

Chlorine content Dissolve about 0.35 g, accurately weighed, in 20 ml of water, add 2 ml of dilute acetic acid TS and 8-10 drops of bromophenol blue IS. Titrate with silver nitrate (0.1 mol/L) VS until the colour changes to bluishviolet. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of Cl. The chlorine content is not less than 16.5% and not more than 17.1%, calculated on the dried basis.

Assay Dissolve about 0.1 g, accurately weighed, in 10 ml of glacial acetic acid and 5 ml of mercuric acetate TS by warming gently. Cool, carry out the method for potentiometric titration (Appendix VII A), titrate with

perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 10.53 mg of $C_6H_{14}N_4O_2 \cdot HCl$.

Category Amino acid.

Storage Preserve in tightly closed containers.

Preparation (1) Arginine Hydrochloride Injection
(2) Arginine Hydrochloride Tablets

Arginine Hydrochloride Injection

Arginine Hydrochloride Injection is a sterile solution of Arginine Hydrochloride in Water for Injections. It contains not less than 95.0% and not more than 105.0% of the labelled amount of arginine hydrochloride ($C_6H_{14}N_4O_2 \cdot HCl$).

Description A colourless, clear liquid.

Identification To a quantity, add 2 mg of ninhydrin and heat, a bluish-violet colour is produced.

pH value 3.0-5.0 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 5 ml per kg of the rabbit's weight injected slowly.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Dilute 10 ml, accurately measured, in a 100 ml volumetric flask, to volume with hydrochloric acid solution (6→10), mix well. Carry out the method for Determination of Optical Rotation (Appendix VI E) and multiply by 4.444 to obtain the amount (g) of $C_6H_{14}N_4O_2 \cdot HCl$ in 10 ml of the substance being examined.

Category As described under Arginine Hydrochloride.

Strength 20 ml : 5 g

Storage Preserve in well closed containers.

Arginine Hydrochloride Tablets

Arginine hydrochloride tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of arginine hydrochloride ($C_6H_{14}N_4O_2 \cdot HCl$).

Description White tablets.

Identification (1) Dissolve a quantity of the powdered tablets, containing 0.25 g of arginine hydrochloride in 5 ml of water, stir and filter. Add 0.5 ml each of α -naphthol solution (dissolve 0.5 g of α -naphthol in 10 ml of 10% sodium hydroxide) and sodium hypobromite solution (dilute 0.2 ml of bromine with 10 ml of 10% sodium hydroxide) into 1 ml of the successive filtrate, a red colour is produced immediately.

(2) Dissolve a quantity of the powdered tablets in water to produce a solution of 10 mg per ml as test solution, prepare a reference solution of 0.1 mg of arginine hydrochloride CRS per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of *n*-propanol-concentrated ammonia water (2 : 1) as the mobile phase. Apply separately to the plate 1 µl each of above two solutions, after developing and removal of the plate, dry it in air, heat at 105°C for 10 minutes, cool and spray with 0.5% ninhydrin in acetone, heat at 105°C until

the colour changes and examine immediately. The colour and position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained in the reference solution.

(3) The retention time of principal peak of the arginine hydrochloride in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of arginine hydrochloride CRS in the chromatogram of the reference solution.

(4) The filtrate obtained in the test (1) yields the reactions characteristic of chlorides (Appendix III).

(2) or (3) may be used alternatively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D). Using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L acetate BS (pH 6.4)-50% acetonitrile solution (65 : 35) as the mobile phase. Detection wavelength is 362 nm. The number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of arginine hydrochloride. The resolution factor between the peaks of arginine hydrochloride and internal standard substance complies with the related requirements.

Internal standard solution Dissolve a quantity of lactamic acid in water to produce a solution of 0.5 mg per ml, mix well.

Procedure Weigh accurately and powder finely 20 tablets, weigh accurately a quantity of the powdered tablets equivalent to about 100 mg of arginine hydrochloride to a 100 ml volumetric flask, dilute with water to the volume, mix well, filter and transfer 1 ml each of the filtrate and internal standard solution into a 10 ml volumetric flask, add 1 ml of 0.5 mol/L sodium bicarbonate solution and 150 μ l of 1% 2, 4-dinitrofluorobenzene in acetonitrile, mix well. Allow to stand in a dark place and heat on water bath at $60 \pm 2^\circ\text{C}$ for 60 minutes, cool and dilute with phosphate BS (pH 7.0) to the volume as test solution, mix well. Inject 10 μ l of the test solution into the column and record the chromatogram. Dissolve a quantity of arginine CRS in water to produce a solution of 0.8 mg per ml as reference solution, transfer 1 ml each of the reference solution and internal standard solution into a 10 ml volumetric flask, proceed as described above beginning at the words "add 1 ml of 0.5 mol/L sodium bicarbonate solution..." Repeat the operation, calculate content of $\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2$ with respect to the peak area obtained in the chromatogram by external standard method, the content of $\text{C}_6\text{H}_{14}\text{N}_4\text{O}_2 \cdot \text{HCl}$ is calculated by multiply the result with 1.209.

Category As described under Arginine Hydrochloride.

Strength 0.25 g

Storage Preserve in tightly closed containers and stored in a dry place.

Artemether

Artemether is (3*R*, 5*aS*, 6*R*, 8*aS*, 9*R*, 10*S*, 12*R*, 12*aR*)-decahydro-10-methoxy-3, 6, 9-trimethyl-3, 12-epoxy-12*H*-pyrano [4, 3-*j*]-1, 2-benzodioxepin. It contains not less than 98.0% and not more than 102.0% of $\text{C}_{16}\text{H}_{26}\text{O}_5$, calculated on the dried basis.

Description White crystals or crystalline powder; odourless; taste, slightly bitter.

Very soluble in acetone or chloroform; soluble in ethanol or ethyl acetate; practically insoluble in water.

Melting range $86-90^\circ\text{C}$ (Appendix VI C).

Specific optical rotation $+168^\circ$ to $+173^\circ$, calculated on the dried basis, in a solution of 10 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) Dissolve about 30 mg in 1 ml of dehydrated ethanol, add 0.1 g of potassium iodide, shake and heat on hot water; a pale yellow colour is produced.

(2) Dissolve about 30 mg in 6 ml of dehydrated ethanol, place several drops on a white porcelain plate, add 1 drop of 1% anisaldehyde solution in sulfuric acid; a peachblow colour is produced.

(3) Use the solution obtained under related substances as test solution. Prepare a reference solution of 10 mg of artemether CRS per ml in chloroform. Carry out the test described under Related substances, beginning at the words "Carry out the method for thin-layer chromatography..." The colour and position of the principal spot in the chromatogram obtained with the test solution corresponds to those of the principal spot obtained with the reference solution.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of artemether CRS (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate (9 : 1) as the mobile phase. Apply to the plate 5 μ l of the solution in chloroform containing 10 mg per ml of the substance being examined, after developing and removal of the plate, dry it in air and expose it to iodine vapour. No spot other than the principal spot appears.

Chlorides To 0.25 g, add 25 ml of water, shake and filter. Using the filtrate, carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 2.5 ml of sodium chloride standard solution (0.01%).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-acetonitrile (45 : 55) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of artemether.

Procedure Transfer about 0.1 g, accurately weighed, to a 10 ml volumetric flask, dissolve and dilute to volume with mobile phase, and mix well. Inject 20 μ l, accurately measured, into the column, record the chromatogram. Repeat the operation, using an accurately weighed quantity of artemether CRS, instead of the substance being examined. Calculate the content of $\text{C}_{16}\text{H}_{26}\text{O}_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antimalarial.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Artemether Capsules

Artemether Capsules

Artemether Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of artemether ($C_{16}H_{26}O_5$).

Identification (1) Dissolve a quantity of the contents of the capsules equivalent to about 80 mg of artemether in 10 ml of dehydrated ethanol, filter and the filtrate complies with tests (1), (2) for Identification described under Artemether.

(2) Dissolve a quantity of the contents of the capsules in chloroform to produce a solution of 10 mg per ml, filter and the filtrate complies with test (3) for Identification described under Artemether.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 500 ml of water (for strength 40 mg) or 1000 ml of water (for strength 100 mg) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 60 minutes and filter. Measure accurately 5 ml of the successive filtrate into a 25 ml volumetric flask, dilute to volume with 1.0 mol/L hydrochloric acid solution in dehydrated ethanol, and mix well as the test solution. Weigh accurately about 16 mg of artemether CRS, into a 100 ml volumetric flask, add dehydrated ethanol to dissolve and dilute to volume. Measure accurately 5 ml into a 50 ml volumetric flask, add 5 ml of water and dilute to volume with 1.0 mol/L hydrochloric acid solution in dehydrated ethanol, and mix well as the reference solution. Immerse the two resulting solutions in a water bath at $70^\circ\text{C} \pm 1^\circ\text{C}$ for 90 minutes, cool to room temperature, measure the absorbance of the two solutions at 254 nm (Appendix IV A), using 1.0 mol/L hydrochloric acid solution in dehydrated ethanol as the blank. Calculate the dissolution of $C_{16}H_{26}O_5$ from each capsule. Not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-acetonitrile (45 : 55) as the mobile phase. Detection wavelength is 210 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of artemether.

Procedure Triturate a quantity of the mixed contents obtained from the test for weight variation of contents. Weigh accurately a quantity of the powder equivalent to about 100 mg of artemether into a 25 ml volumetric flask, add a quantity of mobile phase, ultrasonic for 10 minutes to dissolve the artemether, cool and dilute to volume with mobile phase, mix well, filter, inject accurately measured 20 μl of successive filtrate into the column. Dissolve an accurately weighed quantity of artemether CRS, in mobile phase to produce a solution of 4 mg per ml. Repeat the operation. Calculate the content of $C_{16}H_{26}O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category as described under Artemether.

Strength (1) 40 mg (2) 100 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Artemisinin

$C_{15}H_{22}O_5$ 282.34

[63968-64-9]

Artemisinin is (3*R*,5*αS*,6*R*,8*αS*,9*R*,12*S*,12*αR*)-octahydro-3,6,9-trimethyl-3,12-epoxy-12*H*-pyrano [4,3-*j*]-1,2-benzodioxepin-10 (3*H*)-one. It contains not less than 99.0% of $C_{15}H_{22}O_5$, calculated on the dried basis.

Description Colourless needle crystals; taste, bitter.

Freely soluble in acetone, ethyl acetate, chloroform or, benzene; soluble in methanol, ethanol, dilute ethanol, ether and petroleum ether; practically insoluble in water; Freely soluble in glacial acetic acid.

Melting point 150-153°C (Appendix VI C).

Specific optical rotation +75° to +78°, in a solution of 10 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) Dissolve about 5 mg in 0.5 ml of dehydrated ethanol, add 0.4 ml of potassium iodide TS, 2.5 ml of dilute sulfuric acid and 4 drops of starch IS, a violet colour is produced immediately.

(2) Dissolve about 5 mg in 0.5 ml of dehydrated ethanol, add 0.5 ml of hydroxylamine hydrochloride TS and 0.25 ml of sodium hydroxide TS, heat in a water bath to boil gently, cool, add 2 drops of hydrochloric acid and 1 drop of ferric chloride TS, a deep violet-red colour is immediately produced.

(3) The colour and position of the principal spot in the chromatogram obtained under the test for Related substances with the test solution corresponds to that of the principal spot obtained with the reference solution.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of artemisinin (Appendix XVI).

Related substances Dissolve the artemisinin CRS and the substance being examined in chloroform to produce the reference solution and test solution each of 10 mg per ml, respectively. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of petroleum ether (60-90°C) - ether (6 : 4) as the mobile phase. Apply separately to the plate 3 μl each of the two solutions. After developing and removal of the plate, dry it in air and spray with methanolic solution of anisaldehyde (add slowly 10 ml of glacial acetic acid and 5 ml of concentrate sulfuric acid to 55 ml of methanol, cool to room temperature, pour into 30 ml of methanol containing 0.5 ml of anisaldehyde, mix well and protected from light). Heat the plate at 110°C for 3-5 minutes. The colour and position of the principal spot in the chromatogram obtained with test solution corresponds to that of the principal spot obtained with the reference solution and no other spot is detected.

Loss on drying When dried to constant weight at 80°C,

loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve an accurately weighed quantity in ethanol to produce a solution of about 50 µg per ml. Measure accurately 10 ml to a 50 ml volumetric flask, dilute with 0.2% sodium hydroxide solution to volume, mix well, warm in 50°C ± 1°C water bath for 30 minutes, cool to room temperature. Perform a blank determination with 10 ml of ethanol and make any necessary correction. Measure the absorbance of the solution at 292 nm (Appendix IV A). Repeat the operation, using an accurately weighed quantity of artemisinin CRS instead of the substance being examined. Calculate the content of C₁₅H₂₂O₅.

Category Antimalarial.

Storage Preserve in tightly closed containers, protected from light.

Artesunate Tablets

Artesunate tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of artesunate (C₁₉H₂₈O₈).

Description White tablets.

Identification Dissolve a quantity of powdered tablets equivalent to about 0.1 g of artesunate in 2 ml of chloroform, filter. Carry out the following tests with the filtrate.

(1) Place 2-3 drops of filtrate on a white porcelain plate. Add 1 drop of 2% anisaldehyde sulfuric acid solution after the chloroform volatilized, a red colour is produced.

(2) Take 4-5 drops of the filtrate, volatilize the chloroform, add 1 ml of 7% hydroxylamine hydrochloride in 80% ethanol, add 3 ml of ethanolic potassium hydroxide TS, heat in a water bath to boil, cool, acidify with dilute hydrochloric acid and add 1 drop of ferric chloride TS, a purple colour is produced immediately.

Dissolution Carry out dissolution test (Appendix X C, method 2), using water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes, filter. Measure accurately 20 ml of successive filtrate in a 25 ml volumetric flask, add 2.5 ml of sodium hydroxide solution (1 mol/L), dilute with water to volume, mix well. Weigh accurately 10 mg (50 mg strength) or 20 mg (100 mg strength) of artesunate CRS in a 250 ml volumetric flask, add 200 ml of water and 25 ml of sodium hydroxide solution (1 mol/L), dilute with water to volume, mix well. Warm the two solutions in water bath at 50°C ± 1°C for 45 minutes, cool to room temperature rapidly. Measure the absorbance at 289 nm (Appendix IV A), calculate the dissolution of C₁₉H₂₈O₈ from each tablet. Not less than 60% of the labelled amount is dissolved.

Related substances Dissolve a quantity of the powdered tablets in chloroform to produce a solution of 5 mg per ml and allow to stand as the test solution. Dissolve an accurately weighed quantity of dihydroartemisinin CRS in chloroform to produce a solution of 0.1 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and petroleum (60-90°C) -ethyl acetate-glacial acetic acid (48 : 36 : 1) as the mobile phase. Apply separately to the plate 10 µl each of the solutions. After developing and removal of the plate, dry it in air and spray with 2% anisaldehyde solution in sulfuric acid. Any spot, other than the principal spot in the chromatogram obtained

with the test solution is not more intense than the principal spot obtained with the reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 0.5 g of artesunate in a 200 ml conical flask add accurately 50 ml of neutral ethanol (neutral to phenolphthalein IS), shake thoroughly and filter. Measure accurately 25 ml of successive filtrate to a 100 ml conical flask, add 2 drops of phenolphthalein IS, titrate with sodium hydroxide (0.05 mol/L) VS. Each ml of sodium hydroxide (0.05 mol/L) VS is equivalent to 19.22 mg of C₁₉H₂₈O₈.

Category Antimalarial.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Asparaginase

Asparaginase is an enzyme with action of amide hydrolysis obtained from *E. coli* ASI 357 or *Erwinia carotovora*. It has a potency of not less than 250 Asparaginase Units per mg of protein, Calculated on the dried basis.

Description A white crystalline powder; odourless; tasteless. Freely soluble in water; insoluble in ethanol or ether.

Identification (1) Dissolve 5 mg in 1 ml of water, add 5 ml of 20% sodium hydroxide solution, mix well, add 1 drop of 1% cupric sulfate solution, mix well, a blue violet colour is produced.

(2) Dissolve a quantity in 0.1 mol/L phosphate BS (pH 6.7) to produce a solution of 200 units per ml as the test solution; prepare the reference solution in the same manner using asparaginase CRS instead of the substance being examined.

Carry out the method for size-exclusion chromatography (Appendix V H), using a column packed with hydrophilic gel for chromatography and 0.1 mol/L phosphate BS (pH 6.7) as the mobile phase. The flow rate is 0.6 ml per minute and the detection wavelength is 280 nm. Inject separately 20 µl of each of the test solution and the reference solution into the column, record the chromatogram. The retention time of the principal peak of the test solution is identical with that of the reference solution.

Acidity or alkalinity Dissolve a quantity in water to produce a solution of 10 mg per ml, pH 6.5-7.5 (Appendix VI H).

Clarity and colour of solution A solution of 5 mg per ml in water is clear and colourless.

Purity Inject 20 µl of the test solution described under identification (2) into the column, record the chromatogram. The area of the principal peak is not less than 90.0% of the total areas.

Loss on drying When dried at 105°C for 3 hours, loses not more than 5.0% of its weight (Appendix VIII L), using 0.1 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 0.5 g; not more than 0.002%.

Undue toxicity Dissolve a quantity in Sodium Chloride Injection to produce a solution of 44000 Units per ml. Inject 0.5 ml of the solution into a tail vein of each of 5 healthy

male mice weighing $20 \text{ g} \pm 1 \text{ g}$. None of the mice shows short of breathing or twitching within 30 minutes.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 200 Units per ml in Sodium Chloride Injection per kg of rabbit's weight.

Depressor substances Complies with the test for depressor substances (Appendix XI G), using 10000 Units per kg of the cat's weight.

Assay Enzyme activity *Reference solution* Dissolve an accurately weighed quantity of ammonium sulfate previously dried to constant weight at 105°C in water to produce a 0.001 mol/L solution.

Test solution Dissolve about 0.1 g, accurately weighed, in 0.1 mol/L phosphate BS (Adjust the pH value of 0.1 mol/L disodium hydrogen phosphate solution with 0.1 mol/L sodium dihydrogen solution to 8.0) to produce a solution of 5 units per ml.

Procedure To each of three test tubes ($14 \text{ cm} \times 1.2 \text{ cm}$) add accurately 1.9 ml of 0.33% asparagine solution in the phosphate BS described above, warm in a 37°C water bath for 3 minutes, add accurately 0.5 ml of the 25% trichloroacetic acid solution to one tube (t_0), 0.1 ml of the test solution to each of the other tubes (t) respectively, place the tubes in a 37°C water bath for exact 15 minutes. Add 0.1 ml of the test solution to tube and to each tube add 0.5 ml of 25% trichloroacetic acid solution, mix well, as a blank reaction solution (t_0) and reaction solution (t). Measure accurately 0.5 ml of each of t_0 , t and the reference solution separately to each tube, each solution using two tubes, add 7.0 ml of water and 10 ml of mercuric potassium iodide solution (dissolve 23 g of mercuric iodide and 16 g of potassium iodide in water and add to 100 ml, mix with the equal volume of 20% sodium hydroxide solution before using), mix well. To another tube add 7.5 ml of water and 1.0 ml of mercuric potassium iodide solution, as a blank reference solution, allow to stand for 15 minutes, measure the absorbance (A_0 , A_t and A_s) at 450 nm (Appendix IV A) respectively, calculate the average value as follows:

$$\text{Potency} = \frac{(A_t - A_0) \times 5 \times \text{dilution factor} \times F}{A_s \times W}$$

(Unit/mg)

Where 5 is reaction constant;

F is correction factor of concentration of reference solution.

W is the weight of substance being examined (mg)

1 micromol of ammonia is produced per minute when asparagine is decomposed at $37^\circ\text{C} \pm 1^\circ\text{C}$ by 1 Unit of asparaginase.

Content of protein Carry out the method for determination of nitrogen (Appendix VII D, method 2), using about 20 mg, accurately weighed, multiply the result by 6.25 to calculate the content of protein per mg of the substance being examined.

Enzyme Activity Calculate the Enzyme activity from the expression

$$\frac{\text{Enzyme Activity}}{\text{Activity}} = \frac{\text{potency of asparaginase per mg of the substance being examined (Unit)}}{\text{the content of protein per mg of the substance being examined (mg)}}$$

Category Antineoplastic.

Storage Preserve in tightly closed containers, stored in a cold place and protected from light.

Preparation Asparaginase for Injection

Asparaginase for Injection

Asparaginase for Injection is a sterile, lyophilized preparation of asparaginase with a quantity of stabilizing agent and excipient. It contains not less than 85.0% and not more than 115.0% of the labelled potency of asparaginase.

Description A white lyophilized mass or powder.

Identification (1) A solution of 1000 Units per ml in water complies with test (1) for Identification described under Asparaginase.

(2) Complies with test (2) for Identification described under Asparaginase.

Acidity or alkalinity Dissolve each container in 10 ml of water, pH 6.5-7.5 (Appendix VI H).

Purity Carry out the test for Purity described under Asparaginase; not less than 90.0%.

Loss on drying When dried to constant weight at 105°C , loses not more than 5.0% of its weight (Appendix VIII C), using 0.1 g.

Pyrogens Complies with the test for Pyrogens described under Asparaginase, using 2 containers.

Sterility To each container add 2 ml of Water for Injection, the solution complies with the test for sterility (Appendix XI H).

Other requirements Complies with the general requirements for injection except that minor fibrous insoluble matter and slight opalescence is permitted for Clarity (Appendix I B).

Assay Dissolve each of three containers in 0.1 mol/L phosphate BS (pH 8.0) respectively to produce a solution of about 5 Units per ml. Carry out the Assay described under Asparaginase. The potency per container complies with the related requirement. If one of them fails, repeat the assay using the other three containers, all of them comply with the requirement.

Category As described under Asparaginase.

Strength 10 000 Units

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Asparagine

$\text{C}_4\text{H}_8\text{N}_2\text{O}_3 \cdot \text{H}_2\text{O}$ 150.13

[5794-13-8]

Asparagine is the monohydrate of Asparagine. It contains not less than 98.0% of $\text{C}_4\text{H}_8\text{N}_2\text{O}_3$, calculated on the dried basis.

Description White crystals or crystalline powder; odourless. Freely soluble in hot water, practically insoluble in methanol, ethanol or ether; freely soluble in dilute hydrochloric acid or sodium hydroxide TS.

Specific optical rotation $+31^\circ$ to $+35^\circ$, in a solution of 20

mg per ml in 3 mol/L hydrochloric acid solution (Appendix VI E).

Identification (1) Dissolve 1 g in 5 ml of 10% sodium hydroxide solution and heat gently until boiling, vapour is produced which changes the colour of a wet strip of red litmus TP to blue with an odour of ammonia.

(2) Dissolve 1 mg in 5 ml of water, add about 5 mg of ninhydrin and heat. A purple colour is produced.

Transmittance of solution Dissolve 0.4 g in 20 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.005%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B). Dissolve 2.0 g in 25 ml of water, heat and cool. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.005%).

Free amino acid Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of phenol-water (3 : 1) as the mobile phase. Dissolve a quantity of the substance being examined in a small volume of 50% formic acid solution and dilute with water to produce a test solution containing 2 mg per ml. Dissolve a quantity of aspartic acid CRS in a small volume of 50% formic acid solution and dilute with water to produce a reference solution containing 0.05 mg per ml. Apply separately to the plate 5 μ l each of above two solutions. After development and removal of the plate, dry it in air. Spray with a solution of 1% ninhydrin in a mixture of 3 volumes of acetic acid and 97 volumes of methanol, heat at 80°C. The principal spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution (2.5%).

Loss on drying When dried at 105°C for 3 hours, loses not less than 11.5%, and not more than 12.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Iron Carry out the limit test for iron (Appendix VIII G), dissolve 1.0 g in 25 ml of water. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.02 g. Any opalescence produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.1%).

Heavy metals Dissolve 1.0 g in 23 ml of water by heating, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 2.0 g in a mixture of 23 ml of water and 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Assay Weigh accurately about 0.15 g, carry out the method for determination of nitrogen (Appendix VII D, method 1). Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 6.606 mg of $C_4H_8N_2O_3$.

Category Amino acid.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Asparagine Tablets

Asparagine Tablets

Asparagine tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Asparagine ($C_4H_8N_2O_3$).

Description White tablets.

Identification A quantity of the powdered tablets complies with the tests for identification described under Asparagine.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Accurately weigh a quantity of the powdered tablets equivalent to about 0.15 g of Asparagine. Carry out the Assay described under Asparagine.

Category As described under Asparagine.

Strength 0.25 g (calculated as $C_4H_8N_2O_3$)

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Aspartic Acid

$C_4H_7NO_4$ 133.10

Aspartic acid is L-2-aminobutanedioic acid. It contains not less than 98.5% of $C_4H_7NO_4$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; taste, slightly sour. Soluble in hot water; slightly soluble in water; insoluble in ethanol; soluble in dilute hydrochloric acid solution or sodium hydroxide solution.

Specific optical rotation +24.0° to +26.0°, in a solution of about 80 mg per ml in 6 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of aspartic acid (Appendix XVI).

Acidity Dissolve 0.10 g in 20 ml of water, pH 2.0-4.0 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 10 ml of 1 mol/L hydrochloric acid solution, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.30 g. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 0.70 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.4 ml of potassium sulfate standard solution (0.02%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.10 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of ammonium chloride standard solution (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol -water-glacial acetic acid (2 : 2 : 1) as the mobile phase. Apply separately to the plate 5 µl of each of two solutions of the substance being examined in water containing (1) 10 mg per ml, (2) 0.05 mg per ml. After developing and removal of the plate, dry it in air and spray with a solution of ninhydrin in acetone (1 → 50), heat at 90°C until the colour is produced and examine immediately. Any spots, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml of a solution of 10 mg per ml in Sodium Chloride Injection per kg of the rabbit's weight (for parenteral administration).

Assay Dissolve about 0.1 g, accurately weighed, in 2 ml of anhydrous formic acid, add 30 ml of glacial acetic acid. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 13.31 mg of $C_9H_7NO_4$.

Category Amino Acid.

Storage Preserve in tightly closed containers.

Aspirin

$C_9H_8O_4$ 180.16

[50-78-2]

Aspirin is 2-(acetyloxy) benzoic acid. It contains not less than 99.5% of $C_9H_8O_4$.

Description White crystals or a white crystalline powder; odourless or with a faint acetic acid odour; taste, faintly sour; gradually hydrolyses in contact with moisture to form salicylic acid and acetic acid; aqueous solution yields an acidic reaction.

Freely soluble in ethanol; soluble in chloroform or ether; slightly soluble in water or anhydrous ether; soluble in

solutions of sodium hydroxide or sodium carbonate with decomposition.

Identification (1) To about 0.1 g add 10 ml of water, boil and cool. Add 1 drop of ferric chloride TS; a violet colour is produced.

(2) To about 0.5 g add 10 ml of sodium carbonate TS, boil for 2 minutes and cool. Add excessive dilute sulfuric acid; a white precipitate is produced and an odour of acetic acid is perceptible.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of aspirin (Appendix XVI).

Clarity of solution A solution of 0.50 g in 10 ml of sodium carbonate TS preheated previously to about 45°C is clear.

Salicylic acid Dissolve 0.10 g in 1 ml of ethanol, add cold water to produce 50 ml, add immediately 1 ml of freshly prepared dilute ferric ammonium sulfate solution [to 1 ml of hydrochloric acid solution (9 → 100) add 2 ml of ferric ammonium sulfate IS and add water to produce 100 ml] and mix well; any colour produced within 30 seconds is not more intense than that of a reference solution (dissolve 0.1 g of salicylic acid, accurately weighed, in water, add 1 ml of glacial acetic acid, mix well, add water to produce 1000 ml and mix well. Measure accurately 1 ml, add 1 ml of ethanol, 48 ml of water and 1 ml of freshly prepared dilute ferric ammonium sulfate solution and mix well) (0.1%).

Readily carbonizable substances Carry out the limit test for readily carbonizable substances (Appendix VIII O), using 0.5 g; any colour produced is not more intense than that of a reference preparation (mix 0.25 ml of standard cobalt chloride CS, 0.25 ml of standard potassium dichromate CS, and 0.40 ml of standard copper sulfate CS, with water to produce 5 ml).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 23 ml of ethanol, add 2 ml of acetate BS (pH 3.5) carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.4 g, accurately weighed, in 20 ml of neutral ethanol (neutral to phenolphthalein IS) and add 3 drops of phenolphthalein IS. Titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 18.02 mg of $C_9H_8O_4$.

Category Antipyretic, anti-inflammatory and analgesic agent, anticoagulant.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Aspirin Enteric Capsules
(2) Aspirin Effervescent Tablets
(3) Aspirin Enteric-coated Tablets
(4) Aspirin Suppositories
(5) Aspirin Tablets

Aspirin, Heavy Magnesium Carbonate and Dihydroxyaluminium Aminoacetate Tablets

Aspirin, Heavy Magnesium Carbonate and Dihydroxyaluminium Aminoacetate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of aspirin ($C_9H_8O_4$); contain not less than 35.0% and not more than 45.0% of

the labelled amount of heavy magnesium carbonate, calculated with reference to magnesium oxide (MgO); contain not less than 33.0% and not more than 43.0% of the labelled amount of dihydroxyaluminium aminoacetate, calculated with reference to aluminium oxide (Al_2O_3).

Formula	Aspirin	330 g
	Heavy magnesium carbonate	100 g
	Dihydroxyaluminium aminoacetate	50 g
	Tartaric acid	3.3 g
	Excipients	a quantity
	To make	1000 tablets

Description White and yellow double-layer tablets

Identification (1) Boil a quantity of the powder of the white layer equivalent to about 0.1 g of aspirin with 10 ml of water, cool and add 1 drop of ferric chloride TS; a violet colour is produced.

(2) To a quantity of the powder of the yellow layer equivalent to about 0.1 g of heavy magnesium carbonate, add 10 ml of dilute hydrochloric acid; effervescence begins. Gently warm until dissolved. Add sodium hydroxide TS to make the solution alkaline; a white gelatinous precipitate is produced. Filter and divide the precipitate into two portions. To one portion add excessive sodium hydroxide TS, the precipitate is insoluble; to another portion add 3 drops of iodine TS, the precipitate becomes reddish-brown.

(3) Dissolve a quantity of the powder of the yellow layer equivalent to about 0.05 g of dihydroxyaluminium aminoacetate in 5 ml of dilute hydrochloric acid by gentle warming, add dropwise ammonia TS until a white gelatinous precipitate is produced, add a few drops of 1% sodium alizarinsulfonate; the precipitate becomes cherry red.

Free salicylic acid To a quantity of the powder of the white layer equivalent to about 0.1 g of aspirin, add 3 ml of anhydrous chloroform, constantly stir for 2 minutes and filter through a filter paper moistened with anhydrous chloroform. Wash the residue with two portions of anhydrous chloroform, each of 1 ml. Combine the washings and filtrate, evaporate to dryness in the air flow at room temperature. Dissolve the residue in 4 ml of anhydrous ethanol. Transfer the solution to a 100 ml volumetric flask, wash the container with a small amount of 5% ethanol solution, transfer the washings to the same volumetric flask, dilute with 5% ethanol solution to volume and mix well. To 50 ml of the solution, add immediately 1 ml of freshly prepared dilute ferric ammonium sulfate solution (to 1 ml of hydrochloric acid solution (9 → 100), add 2 ml of ferric ammonium sulfate IS and add water to produce 100 ml) and mix well. Any colour produced within 30 seconds is not more intense than that of a reference solution (dissolve 0.1 g of salicylic acid, accurately weighed, in water in a 1000 ml volumetric flask, add 1 ml of glacial acetic acid mix well, dilute with water to volume and mix well. To 1.5 ml of the solution, accurately measured, add 2 ml of anhydrous ethanol and add 5% ethanol solution to produce 50 ml, add 1 ml of the above freshly prepared dilute ferric ammonium sulfate solution and mix well) (0.3%).

Dissolution Carry out the dissolution test (Appendix X, C, method 1), using hydrochloric acid solution 1000 ml (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Transfer 3 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, add 5 ml of 0.4% sodium hydroxide solution, boil in a water bath for 5 minutes, cool, add 2.5 ml of dilute sulfuric acid

solution, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 303 nm (Appendix IV A), calculate the dissolution of $\text{C}_7\text{H}_6\text{O}_3$ from each tablet, taking 265 as the value of A (1%, 1 cm), and multiplying the result by 1.304. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A)

Assay *Aspirin* Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 0.1 g of aspirin into a 50 ml volumetric flask, add a quantity of anhydrous ethanol, shake for 15 minutes to dissolve aspirin, dilute to volume with anhydrous ethanol and mix well. Filter, transfer 1 ml of the successive filtrate, accurately measured, to a 25 ml volumetric flask, add anhydrous ethanol to volume and mix well. Dissolve an accurately weighed quantity of aspirin CRS in anhydrous ethanol to produce a solution of about 80 µg per ml. Measure the absorbances of the resulting solutions at 276 nm (Appendix IV A). Calculate the content.

Magnesium Oxide To an accurately weighed quantity of the powdered tablets equivalent to about 0.1 g of heavy magnesium carbonate in a beaker, add 5 ml of hydrochloric acid and 25 ml of water, boil to dissolve heavy magnesium carbonate, cool to room temperature with constant stirring. Filter, wash the residue and the container with 25 ml of water in several portions. Combine the washings and filtrate, add 1 drop of methyl red IS, add ammonia TS dropwise until the colour changes from red to yellow, continue to boil for 5 minutes. Filter while hot, wash the residue and the container with 30 ml of 2% ammonium chloride solution. Combine the washings and filtrate, cool, add 5 ml of triethanolamine solution (1 → 2) and 10 ml of ammonia-ammonium chloride BS (pH 10.0), add a small amount of eriochrome black T indicator after cooling in an ice bath for 10 minutes, rapidly titrate with disodium edeate (0.05 mol/L) VS towards the end point, continue the titration until the colour changes from claret to bluish purple. Each ml of disodium edeate (0.05 mol/L) VS is equivalent to 2.015 mg of MgO .

Aluminium Oxide Weigh accurately a quantity of the above powdered tablets equivalent to about 0.05 g of dihydroxyaluminium aminoacetate into a small beaker, add 6 ml of hydrochloric acid solution (1 → 2), warm gently to dissolve the dihydroxyaluminium aminoacetate, add 20 ml of water, boil and cool to room temperature with constant stirring. Filter, wash the residue and the container with 25 ml of water in several portions. Combine the washings and filtrate, add ammonia TS dropwise until a precipitate is just produced. Add hydrochloric acid dropwise until the precipitate is just dissolved. Add 10 ml of ammonium acetate BS (pH 6.0), add 25 ml of disodium edeate (0.05 mol/L) VS, accurately measured, boil for 10 minutes, add 1 ml of xylenol orange IS, titrate with zinc (0.05 mol/L) VS until the colour changes from yellow to red. Perform a blank determination and make any necessary correction. Each ml of disodium edeate (0.05 mol/L) VS is equivalent to 2.549 mg of Al_2O_3 .

Category Analgesic; antipyretic; nonsteroidal anti-inflammatory.

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Aspirin Effervescent Tablets

Aspirin Effervescent Tablets contain not less than

90.0% and not more than 110.0% of the labelled amount of aspirin ($C_9H_8O_4$).

Description White tablets.

Identification (1) Add 10 ml of water to a quantity of the powdered tablets equivalent to about 0.1 g of aspirin, heat to boil, allow to cool and add a drop of ferric chloride TS; a violet colour is produced.

(2) The retention time of the principal peak of aspirin in the test solution in the chromatogram obtained in the Assay is identical with that of the principal peak of aspirin CRS in the chromatogram of the reference solution.

Salicylic acid Carry out the method for high performance liquid chromatography described under Assay, the detection wavelength is 300 nm. Inject 10 μ l of the test solution obtained in Assay into the column, record the chromatogram. Dissolve a quantity of salicylic acid CRS in a mixture of acetonitrile-methanol-formic acid (40 : 59 : 1) to produce a solution of 15 μ g per ml. Repeat the operation described above, and calculate the content of salicylic acid with respect to the peak area obtained in the chromatogram by the external standard method. The content of salicylic acid is not more than 3.0% of the labelled amount of aspirin.

Other requirement Comply with the general requirements for tablets (Appendix I A), except test for friability.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-methanol-0.01 mol/L potassium dihydrogen phosphate solution-triethylamine (10 : 50 : 40 : 0.11, adjust pH to 3.3-3.4 with phosphoric acid) as the mobile phase. Detection wavelength is 280 nm, the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of aspirin. The resolution factor between the peaks of aspirin and salicylic acid complies with the related requirements.

Procedure Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 25 mg of aspirin in a 100 ml conical flask, add accurately 50 ml of a mixture of acetonitrile-methanol-formic acid (40 : 59 : 1), shake thoroughly for 10 minutes to dissolve aspirin, filter quickly. Inject 10 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of aspirin CRS in a mixture of acetonitrile-methanol-formic acid (40 : 59 : 1) to produce a solution of 0.5 mg per ml. Repeat the operation, and calculate the content of $C_9H_8O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Aspirin.

Strength (1) 0.1 g (2) 0.5 g

Storage Preserve in tightly closed containers, stored in a dry place.

Aspirin Enteric Capsules

Aspirin Enteric Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of aspirin ($C_9H_8O_4$).

Description Capsules containing white granules.

Identification (1) Add 10 ml of water to a quantity of the contents equivalent to about 0.1 g of aspirin, heat to boil, allow to cool and add a drop of ferric chloride TS; a violet colour is produced.

(2) The retention time of the principal peak of aspirin in the test solution in the chromatogram obtained in the Assay is identical with that of the principal peak of aspirin CRS in the chromatogram of the reference solution correspondingly.

Salicylic acid Carry out the method for high performance liquid chromatography described under Assay, the detection wavelength is 300 nm. Weigh accurately a quantity of the contents obtained on the Assay, equivalent to about 0.1 g of aspirin, in a 100 volumetric flask, dilute with 1% glacial acetic acid solution in anhydrous methanol to volume, mix well, filter and inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of salicylic acid CRS with 1% glacial acetic acid solution in anhydrous methanol to produce a solution of 30 μ g per ml. Repeat the operation mentioned above, and calculate the content of salicylic acid with respect to the peak area obtained in the chromatogram by the external standard method. The content of salicylic acid is not more than 3.0% of the labelled amount of aspirin.

Drug release (1) *The amount released in acid solution* Comply with the requirements for Drug Release Test [Appendix X D, method 2 (2)], using the apparatus of the dissolution test method I and 500 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium. Adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 2 hours, and filter. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of aspirin CRS in 0.1 mol/L hydrochloric acid solution to produce a solution of 20 μ g per ml. Repeat the operation, and calculate the content of $C_9H_8O_4$ released from each capsule in acid solution.

(2) *The amount released in buffer solution* Drain above 0.1 mol/L hydrochloric acid solution from each of 6 vessels and add immediately 1000 ml of phosphate BS (pH 6.8) at $37^\circ\text{C} \pm 0.5^\circ\text{C}$. Continue to operate the apparatus, withdraw the solution after exactly 45 minutes, and filter. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of aspirin CRS in phosphate BS (pH 6.8) to produce a solution of 0.1 mg per ml. Repeat the operation, and calculate the content of $C_9H_8O_4$ released from each capsule in the buffer solution.

Other requirement Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 1% glacial acetic acid solution-methanol (50 : 50) as the mobile phase. Detection wavelength is 280 nm, the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of aspirin. The resolution factor between the peaks of aspirin and salicylic acid complies with the related requirements.

procedure Dissolve an accurately weighed quantity (equivalent to about 0.1 g of aspirin) of mixed contents obtained in the test for weight variation with 1% glacial acetic acid solution in anhydrous methanol in a 100 ml volumetric flask and dilute to volume, mix well, and filter. Transfer 5 ml of successive filtrate into a 100 volumetric flask and dilute with 1% glacial acetic acid solution in anhydrous methanol to volume, mix well. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of aspirin CRS with 1% glacial acetic acid solution in anhydrous methanol to produce a solution of 50 μ g per ml. Repeat the operation, and calculate the content of $C_9H_8O_4$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Aspirin.

Strength 0.1 g

Storage Preserve in tightly closed containers, stored in a dry place.

Aspirin Enteric-coated Tablets

Aspirin Enteric-coated Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of aspirin ($C_9H_8O_4$).

Description Enteric-coated tablets, with white core.

Identification To a quantity of the powdered tablets equivalent to about 0.1 g of aspirin add 10 ml of water, boil, cool and add 1 drop of ferric chloride TS; a violet colour is produced.

Salicylic acid Triturate 5 tablets with 30 ml of ethanol in portions and transfer the mixture to a 100 ml volumetric flask, shake thoroughly, dilute with water to volume, mix well, filter immediately. Measure accurately 2 ml of the successive filtrate in a Nessler cylinder, add water to produce 50 ml, then add immediately 3 ml of freshly prepared dilute ferric ammonium sulfate solution [to 1 ml of 1 mol/L hydrochloric acid solution, add 2 ml of ferric ammonium sulfate IS and add water to produce 100 ml], and mix well; any colour produced within 30 seconds is not more intense than that of a reference solution (To 4.5 ml of 0.01% salicylic acid solution, accurately measured, add 3 ml of ethanol, 1 ml of 0.05% tartaric acid solution, dilute with water to produce 50 ml, add 3 ml of freshly prepared dilute ferric ammonium sulfate solution and mix well) (1.5%).

Drug release Comply with the drug release test [Appendix X D, method 2 (1)], using the apparatus of the dissolution test method I and 750 ml of 0.1 mol/L hydrochloric acid as the dissolution medium. Adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solvent after exactly 120 minutes, filter, use the successive filtrate as the test solution (1). Then add 250 ml of 37°C 0.2 mol/L sodium phosphate solution, mix well, adjust the pH to 6.8 ± 0.05 with 2 mol/L hydrochloric acid solution or 2 mol/L sodium hydroxide solution. Withdraw 10 ml of the buffer solution after exactly 45 minutes and filter, use the successive filtrate as the test solution (2). Measure the absorbance of the test solution (1) at 280 nm, using 0.1 mol/L hydrochloric acid solution as the blank; the absorbance is not more than 0.25. Weigh accurately 21 mg of aspirin CRS in a 100 ml volumetric flask, add a quantity of sodium phosphate BS (0.05 mol/L) (measure 250 ml of 0.2 mol/L sodium phosphate solution and 750 ml of 0.1 mol/L hydrochloric acid solution, mix well, adjust to pH 6.8 ± 0.05) to dissolve and dilute to volume, as the reference solution. Measure the absorbance of the test solution (2) and the reference solution at 265 nm, using sodium phosphate BS (0.05 mol/L) as the blank. Calculate the amount of $C_9H_8O_4$ released from each tablet; not less than 70% of the labelled amount is released.

Other requirement Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets, triturate with divided portions of 70 ml neutral ethanol and transfer to a 100 ml volumetric flask, shake thoroughly, wash the mortar several times with sufficient water, combine the washings to the flask, dilute with water to volume, mix well and filter. Measure accurately 10 ml of the successive

filtrate equivalent to about 0.3 g of aspirin into a conical flask, add 20 ml of neutral ethanol (neutral to phenolphthalein IS), shake well. Add 3 drops of phenolphthalein IS and sodium hydroxide (0.1 mol/L) VS dropwise until the solution becomes pink. Add 40 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured, heat on a water bath for 15 minutes with shaking, cool immediately to room temperature and titrate with sulfuric acid (0.05 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 18.02 mg of $C_9H_8O_4$.

Category As described under Aspirin.

Strength 0.3 g

Storage Preserve in tightly closed containers, stored in a dry place.

Aspirin Suppositories

Aspirin suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of aspirin ($C_9H_8O_4$).

Description Creamy-white or slightly yellow suppositories.

Identification Warm to dissolve a quantity equivalent to about 0.6 g of aspirin with 20 ml of ethanol, cool in an ice bath for 5 minutes and stir constantly, filter, evaporate the filtrate on a water bath to dryness. The residue complies with the tests (1), (2) for Identification described under Aspirin.

Salicylic acid Carry out the method for high performance liquid chromatography described under Assay, the wave length of the detector is 300 nm. Dissolve a quantity of salicylic acid CRS with ethanol to produce a solution of 15 µg per ml as the reference solution. Inject 10 µl of the solution into the column and record the chromatogram. Inject 10 µl of diluted solution of the successive filtrate obtained from the Assay (diluted with ethanol to produce a solution of 0.5 mg per ml) into the column; calculate the content of salicylic acid with respect to peak area obtained in the chromatogram by external standard method. The salicylic acid is not more than 3.0% of the labelled amount of aspirin.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.1% diethylamine solution glacial acetic acid (40 : 60 : 4) as the mobile phase. The detection wavelength is 280 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of aspirin and the resolution factors between the peaks of aspirin, salicylic acid and internal standard comply with the related requirements.

Internal Standard Solution Dissolve a quantity of caffeine with ethanol to produce a solution of 4 mg per ml as the internal standard.

Procedure Melt 5 suppositories in a small beaker, accurately weighed, on a 40-50°C water bath, cool to room temperature with stirring, weigh accurately a quantity (equivalent to about 0.15 g of aspirin) in a 50 ml volumetric flask, add 5 ml of the internal standard solution accurately measured and a quantity of ethanol, warm on a 40-50°C water bath, shake thoroughly to dissolve aspirin, dilute with ethanol to volume and then set in an ice bath for 1 hour,

filter immediately; measure accurately 2 ml of the successive filtrate to a 50 ml volumetric flask, dilute with ethanol to volume, mix well. Inject 10 μ l into the column, record the chromatogram. Dissolve about 0.15 g of aspirin CRS, accurately weighed, in a 50 ml volumetric flask, add 5 ml of the internal standard and dilute with ethanol to volume, mix well. Measure accurately 2 ml of the solution in a 50 ml volumetric flask, dilute with ethanol to volume, mix well. Repeat the operation. Calculate the content of $C_9H_8O_4$ with respect to the peak area obtained in the chromatogram by internal standard method.

Category As described under Aspirin.

Strength (1) 0.1 g (2) 0.3 g (3) 0.45 g (4) 0.5 g

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Aspirin Tablets

Aspirin Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of aspirin ($C_9H_8O_4$).

Description White tablets, deteriorated on exposure to moisture.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.1 g of Aspirin add 10 ml of water, boil, cool and add 1 drop of ferric chloride TS; a violet colour is produced.

(2) To a quantity of the powdered tablets equivalent to about 0.5 g of Aspirin add 10 ml of sodium carbonate TS, shake and allow to stand for 5 minutes. Filter, boil the filtrate for 2 minutes, cool and add a few drops of sulfuric acid; a white precipitate is produced and an odour of acetic acid is perceptible.

Salicylic acid To a quantity of the powdered tablets equivalent to about 0.1 g of Aspirin add 3 ml of anhydrous chloroform, stir continuously for 2 minutes and filter with a filter paper moistened with anhydrous chloroform. Wash the residue twice with each of 1 ml of anhydrous chloroform, combine the filtrate and washings, evaporate to dryness at room temperature. Dissolve the residue in 4 ml of dehydrated ethanol and transfer to a 100 ml volumetric flask. Wash the container with 5% ethanol and combine the washings to the volumetric flask, dilute with 5% ethanol to volume and mix well. Measure 50 ml of the solution and add immediately 1 ml of freshly prepared dilute ferric ammonium sulfate solution [to 1 ml of hydrochloric acid solution (9→100) add 2 ml of ferric ammonium sulfate IS and add water to produce 100 ml], mix well; any colour produced within 30 seconds is not more intense than that of a reference solution (dissolve 0.1 g of salicylic acid, accurately weighed, in water in a 1000 ml volumetric flask, add 1 ml of glacial acetic acid, mix well, add water to volume and mix well; measure accurately 1.5 ml, add 2 ml of dehydrated ethanol and sufficient 5% ethanol to produce 50 ml, add 1 ml of freshly prepared ferric ammonium sulfate solution, and mix well) (0.3%).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution 1000 ml (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Transfer 3 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, add 5 ml of 0.4% sodium hydroxide

solution, boil in a water bath for 5 minutes and cool. Add 2.5 ml of dilute sulfuric acid, dilute with water to volume and mix well. Measure the absorbance at 303 nm (Appendix IV A). Calculate the dissolution of $C_9H_8O_4$ from each tablet, taking 265 as the value of A (1%, 1 cm) for $C_7H_6O_3$ and multiply the result by 1.304. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I B).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.3 g of Aspirin in a conical flask, add 20 ml of neutral ethanol (neutral to phenolphthalein IS), shake thoroughly. Add 3 drops of phenolphthalein IS and add dropwise sodium hydroxide (0.1 mol/L) VS until the solution becomes pink. Add 40 ml of sodium hydroxide (0.1 mol/L) VS, accurately measured, heat on a water bath for 15 minutes with shaking, cool immediately to room temperature and titrate with sulfuric acid (0.05 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 18.02 mg of $C_9H_8O_4$.

Category As described under Aspirin.

Strength (1) 0.3 g (2) 0.5 g

Storage Preserve in tightly closed containers, stored in a dry place.

Atenolol

$C_{14}H_{22}N_2O_3$ 266.34

[29122-68-7]

Atenolol is 4-[3-[(1-methylethyl) amino-2-hydroxy] propoxy] benzeneacetamide. It contains not less than 98.0% of $C_{14}H_{22}N_2O_3$, calculated on the dried basis.

Description A white powder; odourless or slightly odour. Soluble in ethanol; slightly soluble in chloroform or water; practically insoluble in ether.

Melting point 151-155°C (Appendix VI C).

Identification (1) The light absorption of a 10 μ g per ml solution in dehydrated ethanol exhibits maxima at 227 nm, 276 nm and 283 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of atenolol (Appendix XVI).

Clarity of solution Dissolve 50 mg in 10 ml of water and 5 ml of dilute hydrochloric acid, the solution is clear.

Related substance Carry out the method described under Assay. Dissolve a quantity of the substance being examined with the mobile phase by ultrasonic, dilute with the mobile phase to produce a solution of 0.1 mg per ml as the test solution; Dilute 1 ml of test solution, accurately measured, with the mobile phase to 100 ml and mix well as the reference solution. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of full scale of the chart; Inject separately accurately measured 20 μ l each of the test

solution and the reference solution into the column, record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak are not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 700 ml of phosphate BS (dissolve 6.8 g of potassium dihydrogen phosphate with water and dilute to 1000 ml, adjust the pH to 3.0 with phosphoric acid), 300 ml of methanol and 1.30 g of sodium octanesulfonate as the mobile phase. Detection wavelength is 275 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of atenolol. The resolution factor between the peaks of atenolol and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of phenacetine with the mobile phase to produce a solution of 80 µg per ml.

Procedure Dissolve an accurately weighed quantity, in the mobile phase with ultrasonic treatment to produce a solution of 0.32 mg per 1 as the test solution. Dilute 5 ml each of the test solution and the internal standard solution, both accurately measured, with the mobile phase to 25 ml, mix well. Inject 20 µl of the resulting solution into the column, record the chromatogram. Repeat the operation, using an accurately weighed quantity of atenolol CRS instead of the substance being examined, calculate the content of $C_{14}H_{22}N_2O_3$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category β -adrenoreceptor antagonist.

Storage Preserve in tightly closed containers.

Preparation Atenolol Tablets

Atenolol Tablets

Atenolol Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of atenolol ($C_{14}H_{22}N_2O_3$).

Description White or sugar-coated tablets with white core.

Identification Comply with test (1) for Identification described under Atenolol, using the test solution obtained in the Assay.

Related substance Comply with the test for Related substance described under Atenolol. Dissolve a quantity of powdered tablets equivalent to about 0.10 g of atenolol with the mobile phase by ultrasonic, dilute with the mobile phase to 100 ml and mix well, filter, take the successive filtrate as the test solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using hydrochloric acid solution (9 → 1000) 1000 ml as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with the dissolution medium to produce a solution of about 10 µg per ml. Dissolve an accurately weighed quantity of atenolol CRS in the dissolution

medium to produce a solution of about 10 µg per ml. Measure the absorbance at 224 nm (Appendix IV A), calculate the dissolution of $C_{14}H_{22}N_2O_3$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets, with the coating removed if the tablets are sugar coated. Triturate a quantity of the powder equivalent to about 35 mg of atenolol, accurately weighed, in a mortar with a quantity of dehydrated ethanol. Transfer with dehydrated ethanol in portions to a 50 ml volumetric flask, dilute to volume and mix well. Filter. Transfer 5 ml of the successive filtrate, accurately measured, to another 50 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution and that of a 70 µg per ml solution of atenolol CRS in dehydrated ethanol at 276 nm (Appendix IV A). Calculate the content of $C_{14}H_{22}N_2O_3$.

Category, Storage As described under Atenolol.

Strength (1) 25 mg (2) 50 mg (3) 100 mg

Atropine Sulfate

$(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ 694.84 [5908-99-6]

Atropine Sulfate is 8-methyl-8-azabicyclo [3, 2, 1]-oct-3-ol ester of α -(hydroxymethyl) benzeneacetic acid, sulfate (2 : 1), monohydrate. It contains not less than 98.5% of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$, calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; odourless.

Very soluble in water; freely soluble in ethanol.

Melting point Not lower than 189°C, with decomposition, determined after drying at 120°C for 3 hours (Appendix VI C).

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of atropine sulfate (Appendix XVI).

(2) Yields the reactions characteristic of tropane alkaloids (Appendix III).

(3) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Acidity Dissolve 0.50 g in 10 ml of water, add 1 drop of methyl red IS and titrate with sodium hydroxide (0.02 mol/L) VS; not more than 0.15 ml is required to produce a yellow colour.

Hyoscyamine Carry out the determination of optical rotation (Appendix VI E), using a solution of 50 mg per ml, calculated on the dried basis, in water; the optical rotation is not more than -0.40° .

Other alkaloids Dissolve 0.25 g in 1 ml of hydrochloric acid solution (9→1000). Dilute with water to produce 15 ml, add 2 ml of ammonia TS to 5 ml of the solution and mix; no opalescence is produced immediately.

Loss on drying When dried at 120°C for 3 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve 0.5 g, accurately weighed, in a mixture of 10 ml of glacial acetic acid and 10 ml of acetic anhydride, add 1-2 drops of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 67.68 mg of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4$.

Category Anticholinergic.

Storage Preserve in tightly closed containers.

Preparation (1) Atropine Sulfate Injection
(2) Atropine Sulfate Tablets

Atropine Sulfate Injection

Atropine Sulfate Injection is a sterile solution of atropine sulfate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of atropine sulfate $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$.

Description A clear, colourless liquid.

Identification (1) Evaporate a quantity equivalent to about 5 mg of atropine sulfate on a water bath to dryness; the residue yields the reactions characteristic of tropane alkaloids (Appendix III).

(2) Yields the reactions characteristic of sulfates (Appendix III).

pH value 3.5-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 2.5 mg of atropine sulfate to a 50 ml volumetric flask, dilute with water to volume and mix well, using the resulting solution as the Test solution. Weigh accurately 25 mg of atropine sulfate CRS, to a 25 ml volumetric flask, dissolve in water to volume and mix well. Transfer 5 ml of the solution, accurately measured, to a 100 ml volumetric flask, dilute with water to volume, as the reference solution. Transfer separately 2 ml each of the test solution and the reference solution, accurately measured, to two separators each containing 10 ml of chloroform. Add 2.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green and 1.021 g of potassium hydrogen phthalate in 6.0 ml of sodium hydroxide solution (0.2 mol/L), dilute with water to produce 100 ml, filter if necessary] to each separator, extract for 2 minutes and allow to separate into two layers. Measure the absorbance of the chloroform layers at 420 nm (Appendix IV A), calculate the content of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ and multiply by 1.027.

Category As described under Atropine Sulfate.

Strength (1) 1 ml : 0.5 mg (2) 1 ml : 1 mg
(3) 1 ml : 2 mg (4) 1 ml : 5 mg
(5) 1 ml : 10 mg (6) 2 ml : 1 mg
(7) 2 ml : 5 mg (8) 2 ml : 10 mg

Storage Preserve in well closed containers.

Atropine Sulfate Tablets

Atropine Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of atropine sulfate $[(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O]$.

Description White tablets.

Identification (1) Transfer a quantity of powdered tablets equivalent to about 1 mg of atropine sulfate into a separator, add 5 ml of ammonia TS and extract with 10 ml of ether. Transfer the ether layer to a porcelain dish and evaporate to dryness. The residue yields the reaction characteristic of tropane alkaloids (Appendix III).

(2) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Content uniformity Comply with the requirement (Appendix X E). Transfer 1 tablet to a stoppered test tube, add 6.0 ml of water, accurately measured. Shake thoroughly for 30 minutes and centrifuge. Carry out the method described under the Assay, using the supernatant liquids as the test solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer a quantity of the powdered tablets equivalent to about 2.5 mg of atropine sulfate, accurately weighed, to a 50 ml volumetric flask, add water and shake to dissolve atropine. Dilute with water to volume and filter. The successive filtrate is used as the test solution. Weigh accurately 25 mg of atropine sulfate CRS, to a 25 ml volumetric flask, dissolve in water to volume and mix well. Transfer 5 ml of the solution, accurately measured, to a 100 ml volumetric flask, dilute with water to volume, as the reference solution.

Transfer separately 2 ml each of the test solution and the reference solution, accurately measured, to two separators each containing 10 ml of chloroform. Add 2.0 ml of bromocresol green solution [dissolve 50 mg of bromocresol green and 1.021 g of potassium hydrogen phthalate in 6.0 ml of sodium hydroxide solution (0.2 mol/L), dilute with water to produce 100 ml, filter if necessary] to each separator, extract for 2 minutes and allow to separate into two layers. Measure the absorbance of the chloroform layers at 420 nm (Appendix IV A), calculate the content of $(C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ and multiply by 1.027.

Category As described under Atropine Sulfate.

Strength 0.3 mg

Storage Preserve in tightly closed containers.

Azathioprine

$C_9H_7N_7O_2S$ 277.27

[466-86-6]

Azathioprine is 6-[(1-methyl-4-nitro-1*H*-imidazol-5-yl)thio]-1*H*-purine. It contains not less than 98.0% of $C_9H_7N_7O_2S$, calculated on the dried basis.

Description A pale yellow powder or crystalline powder; odourless; taste, slightly bitter. Very slightly soluble in ethanol; practically insoluble in water; freely soluble in dilute ammonia solution.

Identification (1) Dissolve about 5 mg in several ml of hydrochloric acid (1→2), add drops of iodine TS, a brown precipitate is produced.

(2) Dissolve about 5 mg with (2 mol/L) hydrochloric acid solution and dilute to 100 ml, mix well. Measure accurately 5 ml, dilute with water to 50 ml. The light absorption of the resulting solution exhibits a maximum at 280 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of azathioprine (Appendix XVI).

Acidity or alkalinity Shake 0.50 g with 25 ml of water for 15 minutes, filter. To 20 ml of the successive filtrate, add 0.1 ml of methyl red IS. Not more than 0.1 ml of hydrochloric acid (0.02 mol/L) VS or sodium hydroxide (0.02 mol/L) VS is required to change the colour of the solution.

Related substances Dissolve about 25 mg of the substance being examined in 3 ml of dimethylsulfoxide, dilute with mobile phase to produce a solution of about 250 µg per ml (solution 1), measure accurately 1 ml, dilute with mobile phase to 100 ml and mix well (solution 2). Dissolve a quantity of 6-mercaptopurine CRS, accurately weighed, in a quantity of dimethylsulfoxide, dilute with mobile phase to produce a solution of 1.25 µg per ml (solution 3). Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.05% sodium acetate solution (18 : 82) as the mobile phase. Detection wavelength is 300 nm and the number of the theoretical plates of the column is not less than 3000. Inject 20 µl of the solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 20 µl each of above three solutions into the column, and record the chromatogram for twice the retention time of the principal peak. In the chromatogram obtained with solution (1) the peak area of 6-mercaptopurine is not greater than that of the principle peak in the chromatogram obtained with solution (3), and the sum of the areas of all peaks other than the principal peak is not greater than 1/2 of the area of the principal peak in the chromatogram obtained with solution (2) respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.6 g, accurately weighed, with 20 ml of dilute ammonia solution in a 200 ml volumetric flask. Add accurately 50 ml of silver nitrate (0.1 mol/L) VS, dilute with water to volume and mix well. Filter, measure accurately 100 ml of the successive filtrate, add 20 ml of nitric acid (1→2), allow to cool, add 2 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 27.73 mg of $C_9H_7N_7O_2S$.

Category Immunosuppressive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Azathioprine Tablets

Azathioprine Tablets

Azathioprine Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of azathioprine ($C_9H_7N_7O_2S$).

Description Pale yellow tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.2 g of azathioprine, add 40 ml of 50% ethanol. Shake on heating in a water bath and filter. Evaporate the filtrate to dryness. The residue complies with tests (1), (2) for Identification described under Azathioprine.

Dissolution Carry out dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute the successive filtrate, accurately measured, with water to produce a solution of 10 µg per ml. Dissolve azathioprine CRS in water to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solutions at 280 nm (Appendix IV A). Calculate the dissolution of $C_9H_7N_7O_2S$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity equivalent to about 0.6 g of azathioprine, carry out the method for Assay described under Azathioprine beginning at the words "to 200 ml volumetric flask". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 27.73 mg of $C_9H_7N_7O_2S$.

Category As described under Azathioprine.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected from light.

Azithromycin

$C_{38}H_{72}N_2O_{12}$ 749.00

[83905-01-5]

Azithromycin is (2*R*,3*S*,4*R*,8*R*,10*R*,11*R*,12*S*,13*S*,14*R*)-13-[(2,6-Dideoxy-3-*C*-methyl-3-*C*-methyl-3-*O*-methyl- α -L-ribo-hexopyranosyl)oxy]-2-ethyl-

3,4,10-trihydroxy-3,5,6,8,10,12,14-heptamethyl-11-[[3,4,6-trideoxy-3-(dimethyl-amino)- β -D-xylahexopyranosyl]oxy]-1-oxa-6-azacyclopentadecan-15-one. It has a potency of not less than 945 Azithromycin Units per mg, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, bitter; slightly hygroscopic.

Freely soluble in methanol, acetone, dehydrate ethanol, chloroform or dilute hydrochloric acid solution; practically insoluble in water.

Specific optical rotation -45° to -49° , in a solution of 20 mg per ml in dehydrate ethanol (Appendix VI E).

Identification (1) Dissolve separately a quantity of the substance being examined and azithromycin CRS in dehydrate ethanol to produce solutions each of 5 mg of azithromycin per ml as the test solution and the reference solution. Carry out the method for Related substances. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of azithromycin (Appendix XVI). If any disagreement is found, dissolve a quantity in acetone, mix well, dry it in vacuum and then perform the determination.

Crystallinity Complies with the requirement for Crystallinity (Appendix IX D).

Alkalinity Dissolve about 0.1 g in 25 ml of methanol with shaking, add 25 ml of water, mix well, pH 9.0-11.0 (Appendix VI H).

Related substances Dissolve an accurately weighed quantity in dehydrate ethanol to produce a solution of 20 mg azithromycin per ml as the test solution. Transfer accurately 1.5 ml of the test solution and 30 mg of erythromycin CRS to a 50 ml volumetric flask, transfer separately 1.0 ml and 0.5 ml of the test solution to another two 50 ml volumetric flasks, dilute with dehydrate ethanol to volume respectively as reference solution (1), (2) and (3). Transfer 1.0 ml of the reference solution (3) to 10 ml volumetric flasks, dilute with dehydrate ethanol to volume as reference solution (4). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-n-hexane-diethylamine (10 : 10 : 2) as the mobile phase. Apply separately to the plate 2 μ l each of above five solutions in dehydrated solutions containing (1) 20 mg per ml, (2) 0.6 mg of the substance being examined and 0.6 mg of erythromycin CRS respectively, (3) 0.4 mg per ml of the substance being examined (4) 0.2 mg per ml of the substance being examined and (5) 0.02 mg of the substance being examined. After developing and removal of the plate, dry it in air, spray with an indicator (dissolve 2.5 g of sodium molybdenate and 1 g of cerium sulfate in 10% sulfuric acid solution and dilute to 100 ml), heat at 105°C for a few minutes. The spots of azithromycin and erythromycin in the chromatogram obtained with reference solution (1) must be separated completely. The most intense secondary spot in the chromatogram obtained with test solution is not more intense than the principal spot obtained with reference solution (2) (2%), and any other secondary spots is not more intense than the principal spot obtained with reference solution (3) (1%). Reference solution (4) must appear a clear spot, otherwise repeat the test.

Water Not more than 5.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.0025%.

Assay Dissolve an accurately weighed quantity in ethanol (using 1 ml of ethanol for 2 mg), dilute with sterile water to produce a solution of 1000 Units per ml. Carry out the microbiological assay of antibiotics (Appendix XI A). 1000 Azithromycin Units is equivalent to 1 mg of $\text{C}_{38}\text{H}_{72}\text{N}_2\text{O}_{12}$.

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Preparation (1) Azithromycin for Suspension
(2) Azithromycin Capsules
(3) Azithromycin Dispersible Tablets
(4) Azithromycin Granules

Azithromycin Capsules

Azithromycin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of azithromycin ($\text{C}_{38}\text{H}_{72}\text{N}_2\text{O}_{12}$).

Description Capsules containing white or almost white crystalline powder.

Identification Dissolve a quality of the contents of the capsules in dehydrate ethanol, filter and evaporate the successive filtrate to dryness on a water bath. The residue complies with test (1) for Identification describe under Azithromycin.

Related substances Comply with the test for Related Substances as described under Azithromycin, using a quality of the contents of the capsules.

Water Not more than 5.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using a phosphate BS (to 6000 ml of 0.1 mol/L disodium hydrogen phosphate solution add 40 ml of hydrochloric acid, adjust the pH value to 6.0, add 0.6 g of pancreatin, mix well after dissolve) 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the same solvent to produce a solution of 55 μg per ml, as test solution. Dissolve an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents equivalent to about the average weight of one capsule and a empty capsule shell in a volumetric flask, add a quantity of ethanol (using 1 ml of ethanol for 2 mg of the labelled amount of azithromycin) and the dissolution medium, shake for 30 minutes or ultrasonicate for 10 minutes to dissolve azithromycin. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 55 μg per ml and filter, using the successive filtrate as the reference solution. Measure accurately 5 ml each of the two solution separately to two tubes with stoppers respectively, add accurately 5 ml of sulfuric acid solution (75 \rightarrow 100), mix well, allow to stand for 30 minutes, cool, measure the absorbance of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $\text{C}_{38}\text{H}_{72}\text{N}_2\text{O}_{12}$ from each capsule. Not less than 75% is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E)

Assay Dissolve an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents equivalent to about 0.25 g of azithromycin in ethanol (using 1 ml of ethanol for 2 mg), dilute with sterile water to produce a solution of 1000 Units per ml. Carry out the Assay described under Azithromycin.

Category As described under Azithromycin.

Strength (1) 0.125 g (125000 Units)
(2) 0.25 g (250000 Units)

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Azithromycin Dispersible Tablets

Azithromycin Dispersible Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of azithromycin ($C_{38}H_{72}N_2O_{12}$).

Description A white or almost white tablets.

Identification (1) Dissolve a quality of the powdered tablets in ethanol to produce a solution of 10 mg of azithromycin per ml and filter, using the successive filtrate as test solution. Dissolve a quality of azithromycin CRS in ethanol to produce a reference solution of 10 mg of azithromycin per ml. Carry out the method for Related substances. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

Related substance Comply with the test for Related Substance as described under Azithromycin, using a quantity of the powdered tablets.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using a phosphate BS (to 6000 ml of 0.1 mol/L disodium hydrogen phosphate solution add 40 ml of hydrochloric acid, adjust the pH value to 6.0 ± 0.05) 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exact 15 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the same solvent to produce a solution of 55 µg per ml, as test solution. Triturate 10 tablets, to an accurately weighed quantity equivalent to about the average weight of one tablet add a quantity of ethanol (using 1ml of ethanol for 2 mg of the labelled amount of azithromycin) and the dissolution medium, shake for 30 minutes or ultrasonicate for 10 minutes to make azithromycin dissolved. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 55 µg per ml and filter, using the successive filtrate as the reference solution. Measure accurately 5 ml each of the two solution separately to two tubes with stoppers respectively, add accurately 5 ml of sulfuric acid solution (75→100), mix well, allow to stand for 30 minutes, cool to room temperature, measure the absorbance of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{38}H_{72}N_2O_{12}$ from each tablets. Not less than 75% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A)

Assay Weigh accurately and triturate 10 tablets, dissolve a quantity of powdered tablets, weighed accurately, equivalent to 0.25 of azithromycin in 125 ml of ethanol, dilute with sterile water to produce a solution of 1000 Units

per ml, mix well and allow to stand. Carry out the Assay described under Azithromycin. 1000 Azithromycin Units equivalent to 1 mg of $C_{38}H_{72}N_2O_{12}$.

Category As described under Azithromycin.

Strength (1) 0.1 g (100000 units)
(2) 0.125 g (125000 units)
(3) 0.25 g (250000 units)
(4) 0.5 g (500000 units)

Storage Preserve in tightly closed containers, stored in a dry place.

Azithromycin for Suspension

Azithromycin for Suspension contains not less than 90.0% and not more than 110.0% of the labelled amount of azithromycin ($C_{38}H_{72}N_2O_{12}$).

Description A granules or powder; odour, fragrance; taste, sweet.

Identification Dissolve a quantity in methanol to produce a solution of 30 mg of azithromycin per ml and filter, using the successive filtrate as solution (1). Dissolve an accurately weighed quality of azithromycin CRS in methanol to produce solution (2) of 30 mg per ml. Mix equal volume of the two solutions as solution (3). Carry out test (1) for Identification described under Azithromycin. There is only one spot in the chromatogram obtained with solution (3). The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to the principal spot obtained with solution (3).

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Alkalinity Dissolve a quantity in methanol (using 2.5 ml of methanol for 10 mg of azithromycin), dilute with water to produce a solution of 2 mg of azithromycin per ml, mix well, and perform the determination after 10 minutes, pH 9.0-11.0 (Appendix VI H).

Other requirements Complies with the general requirements for suspension except the Ratio of sedimental volume (Appendix I O).

Assay Dissolve an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents equivalent to about 0.25 g of azithromycin in ethanol (using 1 ml of ethanol for 2 mg), dilute with sterile water to produce a solution of 1000 Units per ml. Carry out the Assay described under Azithromycin.

Category As described under Azithromycin.

Strength 0.1 g (100000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Azithromycin Granules

Azithromycin Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of azithromycin ($C_{38}H_{72}N_2O_{12}$).

Description A suspension granules; taste, sweet.

Identification (1) Dissolve a quantity of the powdered granules in methanol to produce a solution of 30 mg of

azithromycin per ml and filter, using the successive filtrate as test solution. Dissolve a quantity of azithromycin CRS in methanol to produce a reference solution of 30 mg of azithromycin per ml. Mix equal volume of the two solutions as the mixture solution. Carry out the method for Related substances. There is only one spot in the chromatogram obtained with the mixture solution. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

Alkalinity Dissolve a quantity equivalent to 20 mg of azithromycin in 5 ml of methanol, add 5 ml of water, mix well and allow to stand for 10 minutes, pH 8.5-11.5 (Appendix VI H).

Related substance Comply with the test for Related Substance as described under Azithromycin, using a quantity of the powdered Granules.

Water Not more than 2.0 % (Appendix VIII M, Method 1 A)

Other requirements Comply with the general requirements for Granules (Appendix I N)

Assay Dissolve an accurately weighted quantity of the mixed contents obtained from the test for weight variation of contents equivalent to 250 mg of azithromycin with 125 ml of ethanol, dilute with sterile water to produce a solution of 1000 Units per ml, mix well and allow to stand. Carry out the Assay described under Azithromycin using the supernatant liquid. 1000 Azithromycin Units equivalent to 1 mg of $C_{38}H_{72}N_2O_{12}$.

Category As described under Azithromycin.

Strength (1) 0.1 g (100000 units)
(2) 0.125 g (125000 units)
(3) 0.25 g (250000 units)
(4) 0.5 g (500000 units)

Storage Preserve in tightly closed containers, stored in a dry place.

Azithromycin Tablets

Azithromycin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of azithromycin ($C_{38}H_{72}N_2O_{12}$).

Description White tablets or film coated tablets with white or almost white core.

Identification Dissolve a quantity of the powdered tablets in ethanol to produce a solution of 10 mg of azithromycin per ml and filter, using the successive filtrate as a test solution. Dissolve a quantity of azithromycin CRS in ethanol to produce a reference solution of 10 mg of azithromycin per ml, the solutions comply with test (1) for Identification describe under Azithromycin.

Related substances Dissolve an accurately weighed quantity of the powdered tablets in dehydrate ethanol to produce a solution of 20 mg azithromycin per ml as the test solution. Transfer accurately 1.5 ml of the test solution and 30 mg of erythromycin CRS to a 50 ml volumetric flask, transfer separately 1.5 ml and 0.5 ml of the test solution to another two 50 ml volumetric flasks, dilute with dehydrate ethanol to volume respectively as reference solution (1), (2) and (3). Transfer 1.0 ml of the reference solution (3) to 10 ml volumetric flasks, dilute with dehydrate ethanol to volume as reference solution (4). Carry out the method for thin-layer

chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-n-hexane-diethylamine (10 : 10 : 2) as the mobile phase. Apply separately to the plate 2 μ l each of above five solutions in dehydrated solutions containing (1) 20 mg per ml, (2) 0.6 mg of the substance being examined and 0.6 mg of erythromycin CRS respectively, (3) 0.4 mg per ml of the substance being examined (4) 0.2 mg per ml of the substance being examined and (5) 0.02 mg of the substance being examined. After developing and removal of the plate, dry it in air, spray with an indicator (dissolve 2.5 g of sodium molybdenate and 1 g of cerium sulfate in 10% sulfuric acid solution and dilute to 100 ml), heat at 105°C for a few minutes. The spots of azithromycin and erythromycin in the chromatogram obtained with reference solution (1) must be separated completely. The most intense secondary spot in the chromatogram obtained with test solution is not more intense than the principal spot obtained with reference solution (2) (3%), and any other secondary spots is not more intense than the principal spot obtained with reference solution (3) (1%). Reference solution (4) must appear a clear spot, otherwise repeat the test.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using a phosphate BS (to 6000 ml of 0.1 mol/L disodium hydrogen phosphate solution add 40 ml of hydrochloric acid, adjust the pH value to 6.0) 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the same solvent to produce a solution of 55 μ g per ml, as test solution. Triturate 10 tablets, to an accurately weighed quantity equivalent to about the average weight of one tablet add a quantity of ethanol (using 1 ml of ethanol for 2 mg of the labelled amount of azithromycin) and the dissolution medium, shake for 30 minutes or ultrasonicate for 10 minutes to dissolve Azithromycin. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 55 μ g per ml and filter, using the successive filtrate as the reference solution. Measure accurately 5 ml each of the two solution separately to two tubes with stoppers respectively, add accurately 5 ml of sulfuric acid solution (75 \rightarrow 100), mix well, allow to stand for 30 minutes, cool, measure the absorbance of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{38}H_{72}N_2O_{12}$ from each tablets. Not less than 75% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and triturate 10 tablets, dissolve an accurately weighed quantity equivalent to 0.25 g azithromycin in 125 ml of ethanol, dilute with sterile water to produce a solution of 1000 Units per ml, mix well, carry out the Assay described under Azithromycin using the supernatant liquid (Appendix VI A).

Category As described under Azithromycin.

Strength (1) 0.125 g (125000 Units)
(2) 0.25 g (250000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Bacitracin

[1405-87-4]

Bacitracin has a potency of not less than 55 bacitracin Units per mg, calculated on the dried basis.

Description An almost white to pale yellow powder; odourless; taste, bitter; hygroscopic; destroyed by oxidizing agents and precipitated by heavy metal salts in solution.

Freely soluble in water; soluble in ethanol; insoluble in acetone, chloroform or ether.

Identification Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and butanol-glacial acetic acid-water-pyridine-ethanol (60:15:10:6:5) as the mobile phase. Apply separately to the plate 5 µl each of two solutions in 1% disodium edetate solution containing (1) 6.0 mg per ml of the substance being examined, (2) 6.0 mg per ml of bacitracin RS. After developing and removal of the plate, dry it in air and spray with 1% solution of ninhydrin in butanol-pyridine (99:1), heat at 105°C for 5 minutes until brownish red spots develop. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot in the chromatogram obtained with solution (2).

Acidity or alkalinity An aqueous solution of 1000 Units per ml, pH 5.5-7.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of 100 Units per ml. Carry out the Microbiological Assay of Antibiotics (Appendix XI A).

Category Antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Bacitracin Ointment
(2) Bacitracin Eye Ointment
(3) Compound Neomycin Ointment

Bacitracin Eye Ointment

Bacitracin Eye Ointment contains not less than 90.0% and not more than 120.0% of the labelled amount of bacitracin.

Description A pale yellow or yellow ointment.

Identification To a quantity of the substance being examined, add a quantity of 1% disodium edetate solution, stir and heat in a water bath. Allow it to cool, filter, using the filtrate to make a solution containing 500 bacitracin Units per ml as the test solution. Dissolve a quantity of Bacitracin RS with 1% disodium edetate solution to produce a solution containing 250 bacitracin Units per ml as the reference solution. Carry out the test for Identification described under Bacitracin.

Other requirements Complies with the general requirements for eye preparations (Appendix I G).

Assay Transfer about 2 g, accurately weighed, in a

separator, add 20 ml of peroxide free ether, shake thoroughly to dissolve vaseline, extract with 3-4 portions each of 10 ml of phosphate BS (pH 6.0). Dilute the combined extracts with phosphate BS (pH 6.0). Measure accurately a quantity and carry out the assay described under Bacitracin.

Category As described under Bacitracin.

Strength 2 g (1000 Units)

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Bacitracin Ointment

Bacitracin Ointment contains not less than 90.0% and not more than 120.0% of the labelled amount of bacitracin.

Description A pale yellow or yellow ointment.

Identification To a quantity of the substance being examined add a quantity of 1% disodium edetate solution, stir and heat in a water bath, allow it to cool, filter, using the filtrate to make a solution containing 500 bacitracin Units per ml as the test solution. Dissolve a quantity of Bacitracin RS with 1% disodium edetate solution to produce a solution containing 250 bacitracin Units per ml as the reference solution. Carry out the test for Identification described under Bacitracin.

Other requirements Complies with the general requirements for Ointment (Appendix I F).

Assay Transfer about 2 g, accurately weighed, in a separator, add 20 ml of peroxide free ether, shake thoroughly to dissolve vaseline, extract with 3-4 portions each of 10 ml of phosphate BS (pH 6.0). Dilute the combined extracts with phosphate BS (pH 6.0). Measure accurately a quantity and carry out the Assay described under Bacitracin.

Category As described under Bacitracin.

Strength 8 g (4000 Units)

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Barium Sulfate (Type I)

BaSO₄ 233.39

[7727-43-7]

Description A fine, white, bulky powder; odourless; tasteless.

Insoluble in water, organic solvent, acids or sodium hydroxide solutions.

Identification Boil about 0.3 g with 10 ml of sodium carbonate TS and filter. Acidify the filtrate with hydrochloric acid; the solution yields the reactions characteristic of sulfate (Appendix III). Wash the residue with water, dissolve it in dilute acetic acid and filter again; the filtrate yields the reactions characteristic of barium salts (Appendix III).

Sedimentation Place 5.0 g to a 50 ml, glass-stoppered cylinder (the height of the graduation is 11-14 cm from the bottom). Add water to volume. Shake the mixture vigorously for 1 minute to make the powder suspend homogeneously. Allow it to stand for 15 minutes. The surface of the suspension does not settle below the 18 ml

graduation mark.

Acidity or alkalinity Stir 1.0 g with 20 ml of water in a water bath for 5 minutes, and filter. Divide the filtrate into two equal portions; To one portion add a drop of bromothymol blue TS, no blue colour is produced; to the other portion add a drop of bromocresol green IS, a blue colour is produced.

Acid-soluble substances Boil 10.0 g with 10 ml of dilute hydrochloric acid and 90 ml of water for 10 minutes, add water to restore approximately the original volume, and cool. Filter through paper previously washed with hydrochloric acid solution (1→40), repeat the filtration if necessary, to obtain a clear filtrate. Evaporate 50 ml of the clear filtrate on a water bath to dryness, add 2 drops of hydrochloric acid and 10 ml of hot water, and stir. Filter again through acid-washed paper, wash the residue with 10 ml of hot water, and evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried at 105°C to constant weight. The residue, when dried to constant weight at 105°C, weighs not more than 15 mg (0.30%).

Acid-soluble barium salts Stir the residue obtained in the test for Acid-soluble substances with 10 ml of water, filter through paper previously washed with hydrochloric acid solution (1→40), add 0.5 ml of dilute sulfuric acid to the filtrate and allow to stand for 30 minutes; no opalescence is produced.

Sulfides Carry out the limit test for sulfides (Appendix VIII C), using 10 g; the lead acetate test paper shows no colour change.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals To 4.0 g add 4 ml of dilute acetate BS (pH 3.5) and a quantity of water to produce 50 ml, boil for 10 minutes and cool. Add water to restore 50 ml and filter. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 25 ml of the filtrate; not more than 0.001%.

Arsenic To 2.0 g add 23 ml of water and 5 ml of hydrochloric acid. Complies with the limit test for arsenic (Appendix VIII J, method 1) (0.0001%).

Category Diagnostic agent.

Storage Preserve in tightly closed containers.

Preparation Barium Sulfate (Type I) for Suspension

Barium Sulfate (Type I) for Suspension

Barium Sulfate (Type I) for Suspension is a dry suspension of barium sulfate (Type I) mixed with one or more suitable dispersing agents and flavours.

Description A fine, white, bulky powder; odour, fragrant.

Identification Complies with the tests for Identification described under Barium Sulfate (Type I), using 0.3 g.

Acidity or alkalinity Prepare an aqueous suspension of 100 g in 100 ml of water, pH 5.5-7.5 (Appendix VI H).

Ratio of sedimental volume Place 100 g in a 100 ml glass-stoppered, graduated cylinder, add water to make 100 ml. Shake thoroughly to produce an suspension and allow it to

stand for 3 hours; the surface of suspension does not settle below the 97 ml graduation mark.

Size of the particles To 0.5 g add water to make 50 ml, shake thoroughly, allow it to stand for 10 minutes, decant the supernatant liquid, leaving about 1 ml of the suspension. Place 1 drop of suspension on a microscope slide, examine the object for three fields of view using a microscope of 400 folds magnification. Most particles are less than 2 μm in diameter and no particle is larger than 10 μm in diameter.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Viscosity To 100 g add water to produce 100 ml of suspension, determine the viscosity at 25°C (Appendix VI G, method 2), using model NDJ-1 rotating viscometer adjusting the rotor No. 1 speed at 60 rpm. The viscosity is not greater than 0.015 Pa · s.

Acid and alkali resistance Adjust the pH of the suspension described under the test of viscosity with hydrochloric acid solution (9→100) and sodium hydroxide TS to 1 and 14 respectively, carry out the determination of Apparent viscosity described above immediately. The viscosity is not greater than 0.03 Pa · s.

Other requirements Complies with the general requirements for suspension (Appendix I O).

Category As described under Barium Sulfate (Type I).

Storage Preserve in tightly closed containers.

Barium Sulfate (Type II)

BaSO₄ 233.39

Barium Sulfate Type II is a purified product of barite, a mineral of sulfate. It contains not less than 97.0% of BaSO₄, calculated on the dried basis.

Description White fine bulky powder; odourless, tasteless. Insoluble in water, organic solvent, acids or sodium hydroxide solution.

Identification Boil about 0.3 g with 10 ml of sodium carbonate TS and filter. Acidify the filtrate with hydrochloric acid; the solution yields the reactions characteristic of sulfates (Appendix III). Wash the residue with water, dissolve it in dilute acetic acid, filter, the filtrate yields the reactions characteristic of barium salts (Appendix III).

Acidity or alkalinity To 20.0 g add 20 ml freshly boiled and cooled water, stir thoroughly to produce a suspension, pH 6.0-8.0 (Appendix V H).

Acid-soluble substances Boil 10.0 g with 10 ml of dilute hydrochloric acid and 90 ml of water for 10 minutes in a beaker, add water to restore approximately the original volume and cool. Filter through a filter paper previously washed with hydrochloric acid solution (1→40), repeat the filtration if necessary, to obtain a clear filtrate. Evaporate 50 ml of the clear filtrate on a water bath to dryness, add 2 drops of hydrochloric acid and 10 ml of hot water, stir. Filter again through a filter paper previously washed with hydrochloric acid solution (1→40), wash the residue with 10 ml of hot water, evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried at 105°C to constant weight. When dried to constant weight at 105°C, the weight of residue is not more than 15 mg (0.3%).

Acid-soluble barium salts Stir the residue obtained in the test

for acid-soluble substances with 10 ml of water, filter through a filter paper previously washed with hydrochloric acid solution (1→40), add 0.5 ml of dilute sulfuric acid to the filtrate, allow to stand for 30 minutes; no opalescence is produced.

Sulfides Carry out the limit test for sulfides (Appendix VIII C), using 10 g; the lead acetate test paper shows no colour change.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals To 4.0 g add 4 ml of acetate BS (pH 3.5) and a quantity of water to produce 50 ml, boil for 10 minutes, cool. Add water to restore 50 ml and filter. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 25 ml of the filtrate; not more than 0.001%.

Arsenic To 2.0 g add 23 ml of water and 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Size of the particles To 0.5 g add water to 50 ml, shake thoroughly, place 1 drop of the suspension on a microscope slide immediately. Examine the object for three fields of vision, using a microscope of 400 folds in magnification. Particles are in the range of 0.5-50 µm in diameter; any particles larger than 50 µm in diameter are not more than two.

Assay Weigh accurately about 0.6 g in a weighed platinum crucible, add 10 g of anhydrous sodium carbonate, mix well, ignite until melted continue to ignite for 30 minutes, allow to cool. Place the crucible in a 400 ml beaker, add 250 ml of water, heat and stir with glass rod until melts are separated from the crucible. Remove the crucible and wash the crucible with water, combine the washings to the beaker, wash the inner part of the crucible with 2 ml of acetic acid solution (6 mol/L) then with water, combine the washings to the beaker. Heat and stir until melts are disintegrated, cool the beaker in an ice bath until the precipitate solidifies. Decant the supernatant liquid filter and suspended any fine precipitate on a filter paper cautiously. Wash the contents in the beaker with cold sodium carbonate solution (1→50) twice, each of about 10 ml, stir, filter again through the same filter paper cautiously. Put the beaker containing some large pieces of barium carbonate under the filtering funnel, wash the filter paper with hydrochloric acid solution (3 mol/L) for 5 times of 1 ml each, then wash with water (note: a slight turgidity may produce). To the beaker add 100 ml of water, 5 ml of hydrochloric acid, 10 ml of ammonium acetate solution (2→5), 25 ml of potassium dichromate solution (1→10) and 10 g of urea, cover with a watch glass, heat at 80-85°C for 16 hours, filter immediately. Transfer the precipitate completely to a sintered glass crucible, previously dried to constant weight, wash the precipitate with potassium dichromate solution (1→200) and then with 20 ml of water, dry at 105°C for 2 hours. The weight multiplied by 0.9213 represents the weight of BaSO₄.

Category Diagnostic agent.

Storage Preserve in tightly closed containers.

Preparation Barium Sulfate (Type II) for Suspension

Barium Sulfate (Type II) for Suspension

Barium Sulfate (Type II) for Suspension is a dry

suspension of barium sulfate (Type II) mixed with suitable amount of dispersing agents and flavours.

Description White bulky fine powder; odour, fragrant.

Identification Complies with the tests for Identification described under Barium Sulfate (Type II), using about 0.3 g.

Acidity and Alkalinity To 100 g add water to produce 100 ml of suspension, pH 5.0-9.0 (Appendix VI H).

Size of the particles Add 20 ml of water to 1.0 g, shake thoroughly to mix well, immediately place 1 drop of the suspension on a microscope slide, examine the object for three fields of vision, using a microscope of 400 folds of magnification, most particles are not less than 0.5 µm and more than 50 µm in diameter; the particles larger than 50 µm in diameter are not more than 2.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% (Appendix VIII L).

Viscosity To 200 g add water to produce 100 ml of suspension, determine the viscosity at 25 °C (Appendix VI G, method 2). Using a model NDJ-1 rotating viscosimeter. The viscosity is not more than 0.150 Pa · s, adjust the speed of rotator no. 1 at 30 rpm.

Acid and alkali resistance To the suspension obtained in the test for viscosity, adjust the pH to 1 and 14 with hydrochloric acid solution (9→100) and sodium hydroxide TS respectively; carry out the determination of viscosity using method described above immediately. The viscosities are both not more than 0.150 Pa · s.

Carbon dioxide resistance To 3 g of double contrast medium gas producing agent composed citric acid (hydrate), sodium bicarbonate, antifoaming agent and excipient. The acid granules and base granules are prepared respectively and packed with the mixed ratio of 1:1.3. add 10 ml of water, combine the gas produced solution and the suspension obtained in the test for acid and alkali resistance, stir to mix well, carry out the determination of viscosity immediately using the method described above, The viscosity is not more than 0.150 Pa · s.

Other requirements Complies with the general requirements for suspension (Appendix I O).

Category As described under Barium Sulfate (Type II).

Storage Preserve in tightly closed containers.

Beclometasone Dipropionate

C₂₈H₃₇ClO₇ 521.05

[5534-09-8]

Beclometasone Dipropionate is 9-chloro-11β,17,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17,21-dipropionate. It contains not less than 97.0% and not more than 103.0% of C₂₈H₃₇ClO₇,

calculated on the dried basis.

Description A white or almost white powder; odourless. Freely soluble in acetone or chloroform; soluble in methanol; sparingly soluble in ethanol; practically insoluble in water.

Specific optical rotation $+88^{\circ}$ to $+94^{\circ}$, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of beclometasone dipropionate CRS.

(2) The light absorption of a solution of 20 μg per ml in ethanol exhibits a maximum at 239 nm; the absorbance is about 0.57 to 0.60 (Appendix IV A). The ratio of the absorbance at 239 nm to that at 263 nm is 2.25 to 2.45.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of beclometasone dipropionate (Appendix XVI).

(4) Weigh about 25 mg, carry out the method for oxygen-flask combustion (Appendix VII C), using a mixture of 20 ml of water and 1 ml of 0.4% sodium hydroxide solution as the absorbing liquid. The resulting solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-methanol-water (95:5:0.2) as the mobile phase. Apply separately to the plate 5 μl each of two solutions in chloroform-methanol (9:1) containing (1) 3.0 mg per ml and (2) 60 μg per ml of the substance being examined. After developing and removal of the plate, dry it in air and then at 105°C for 10 minutes. Cool and spray with alkaline tetrazolium blue TS. Not more than 2 secondary spots are observed in the chromatogram obtained with solution (1); and any secondary spot is not more intensely coloured than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (74:26) as the mobile phase. Detection wavelength is 240 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of beclometasone dipropionate. The resolution factor between the peaks of beclometasone dipropionate and internal standard is not less than 4.0.

Internal standard solution Dissolve methyltestosterone in mobile phase to produce a solution of 0.12 mg per ml.

Procedure Dissolve about 12.5 mg of the substance being examined, accurately weighed, transfer 74 ml of methanol in a 100 ml volumetric flask, and dilute with water to volume, mix well, as the reference solution. Transfer 10 ml of the reference solution and 5 ml of internal standard solution, both accurately measured, in a 50 ml volumetric flask, dilute with mobile phase to volume, mix well, inject 20 μl of the resulting solution into the column. Repeat the operation, using beclometasone dipropionate CRS, instead of the substance being examined, calculate the content of $\text{C}_{28}\text{H}_{37}\text{ClO}_7$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Beclometasone Dipropionate Aerosol
(2) Beclometasone Dipropionate Cream

Beclometasone Dipropionate Aerosol

Beclometasone Dipropionate Aerosol is an aerosol with metered dose valve. It contains not less than 85.0% and not more than 120.0% of the labelled amount of beclometasone dipropionate ($\text{C}_{28}\text{H}_{37}\text{ClO}_7$).

Description A white suspension in pressurized container; spray out as foggy particles on release of the delivery valve.

Identification On the aluminum cover of the container punch a hole and insert an injection needle with a dry rubber tubing into the container (do not contact the surface of liquid). The other end of the rubber tubing is inserted into water, allow the propellant to expel completely, remove the aluminum cover and expel the remaining propellant on a water bath. Wash the residual content with a quantity of 3 ml of cyclohexane for 3 times, filter with the same filter paper. Expel cyclohexane, wash the residual content within the container and on filter paper with 50 ml of dehydrated ethanol and filter. Dilute an accurately measured quantity of the successive filtrate equivalent to about 1 mg of beclometasone dipropionate with dehydrated ethanol to 50 ml. Carry out the method for the spectrophotometry (Appendix IV A), the light absorption exhibits a maximum at 239 nm.

Other requirements Comply with the general requirements for aerosol (Appendix I L).

Assay Reference preparation Dissolve 20 mg of beclometasone dipropionate CRS, accurately weighed, in a 100 ml volumetric flask in dehydrated ethanol and dilute to volume.

Test preparation Carry out the tests for the content of ingredient per delivery under Aerosols (Appendix I L), dilute accurately with dehydrated ethanol to produce a solution of 0.2 mg of the substance being examined per ml.

Procedure To 2 ml each of two preparations, accurately measured, in separate 25 ml stoppered volumetric flasks add accurately 2 ml of triphenyltetrazolium chloride TS and mix well; then add accurately 2 ml of tetramethylammonium hydroxide TS and mix well. Allow to stand in the dark place at 35°C for 1 hour and cool. Carry out the method for spectrophotometry (Appendix IV A), measure the absorbance at 485 nm. Calculate the content of $\text{C}_{28}\text{H}_{37}\text{ClO}_7$.

Category As described under Beclometasone Dipropionate.

Strength

(1)	50 μg per delivery; 200 deliveries per container
(2)	80 μg per delivery; 200 deliveries per container
(3)	100 μg per delivery; 200 deliveries per container
(4)	200 μg per delivery; 200 deliveries per container
(5)	250 μg per delivery; 200 deliveries per container
(6)	250 μg per delivery; 80 deliveries per container

Storage Preserve in well closed containers, stored in a dark and cool place.

Beclometasone Dipropionate Cream

Beclometasone Dipropionate Cream contains not less than 85.0% and not more than 115.0% of the labelled amount of beclometasone dipropionate ($C_{28}H_{37}ClO_7$).

Description A white cream.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of beclometasone dipropionate CRS.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Carry out the Assay described under Beclometasone Dipropionate. To an accurately weighed quantity of the ointment equivalent to 1.25 mg of beclometasone dipropionate add 30 ml of methanol. Heat in a water bath at 80°C for 2 minutes with stirring to dissolve beclometasone dipropionate, cool to room temperature. Add 5 ml of internal standard solution, accurately measured, dilute with methanol to 50 ml and mix well. Cool in an ice bath for at least 2 hours, filter swiftly. Inject 20 μ l of the successive filtrate into the column. Calculate the content of $C_{28}H_{37}ClO_7$.

Category As described under Beclometasone Dipropionate.

Strength 10 g:2.5 mg

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Bendazac Lysine

$C_6H_{14}N_2O_2 \cdot C_{16}H_{14}N_2O_3$ 428.49 [81919-14-4]

Bendazac lysine is L-lysine [(1-Benzyl-1*H*-indazol-3-yl) oxy] acetate. It contains not less than 98.5% of $C_6H_{14}N_2O_2 \cdot C_{16}H_{14}N_2O_3$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter. Soluble in water; practically insoluble in ethanol or chloroform.

Melting range 179-184°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 40 μ g per ml in water at 307 nm (Appendix IV A), the value of A (1%, 1 cm) is 125-135.

Identification (1) The light absorption of a solution of 30 μ g per ml in water exhibits a maximum at 307 nm, and a minimum at 272 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of bendazac lysine CRS.

Acidity or alkalinity Dissolve 1.0 g in 50 ml of water, pH 5.5-7.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.1 g in 10 ml of

water is clear and colourless; any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-glacial acetic acid (15:1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in ethanol (70%) containing (1) 10 mg of substance being examined per ml, (2) 20 μ g of 3-hydroxy-1-Benzyl-indazol CRS per ml. After developing and removal of the plate, dry it in air and examine under ultra-violet light (254 nm). Not more than one, other than the principal spot in the chromatogram, obtained with solution (1) is observed. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.2%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1mol/L) VS is equivalent to 21.42mg of $C_6H_{14}N_2O_2 \cdot C_{16}H_{14}N_2O_3$.

Category Ophthalmics.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Bendazac lysine eye drops

Bendazac Lysine Eye Drops

Bendazac lysine eye drops are a solution of bendazac lysine and suitable bacteriostatic agent in water. It contains not less than 90.0% and not more than 110.0% of the labelled amount of bendazac lysine ($C_6H_{14}N_2O_2 \cdot C_{16}H_{14}N_2O_3$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Use a quantity of the eye drops as test solution, dissolve a quantity of bendazac lysine CRS in water to produce a solution of 5 mg per ml as reference solution. Carry out the test for Related substances described under Bendazac lysine, the fluorescent colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with reference solution.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 307 nm, and a minimum at 272 nm (Appendix IV A).

pH value 6.8-7.8 (Appendix VI H).

Osmotic pressure ratio 0.90-1.10 (Appendix IX G).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Dilute an accurately measured quantity with water to produced a solution of 40 μ g of bendazac lysine per ml. Measure the absorbance of the solution at 307 nm (Appendix

[V A]. Calculate the content of $C_6H_{14}N_2O_2 \cdot C_{16}H_{14}N_2O_3$, taking 130 as the value of A (1%, 1 cm).

Category As described under Bendazac Lysine.

Strength (1) 5 ml:25 mg (2) 8 ml:40 mg

Storage Preserve in tightly closed containers, protected from light.

Bendrofluazide

$C_{15}H_{14}F_3N_3O_4S_2$ 421.41

[71-48-3]

Bendrofluazide is 3 - (phenylmethyl) - 6 - (tri - fluoromethyl) - 7 - sulfonamide - 3,4 - dihydro - 2H - 1,2,4-benzothiadiazine-1,1-dioxide. It contains not less than 98.0% and not more than 102.0% of $C_{15}H_{14}F_3N_3O_4S_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Freely soluble in acetone; soluble in ethanol; slightly soluble in ether; insoluble in water or chloroform; soluble in alkali solution.

Identification (1) Warm about 20 mg with 1 ml of 5% potassium permanganate solution, acidified with sulfuric acid; the odour of phenyl acetaldehyde is perceptible.

(2) Heat gently about 20 mg in a small test tube until it becomes carbonized; the odour of sulfur dioxide is perceptible.

(3) The light absorption of a solution of 15 µg per ml in 0.01 mol/L sodium hydroxide solution exhibits maxima at 274 nm and 329 nm, the absorbance is about 0.62 and 0.12 respectively (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bendrofluazide (Appendix XVI).

(5) Yields reactions characteristic of organic fluorides (Appendix III).

Aromatic primary amine Dissolve about 80 mg, accurately weighed, in acetone in a 100 ml volumetric flask, add acetone to volume, mix well. Measure accurately 1 ml, add 9 ml of 1 mol/L hydrochloric acid solution and immediately 0.1 ml of 4% sodium nitrite solution, mix well and allow to stand for 1 minute. Add 0.2 ml of 10% ammonium sulfamate solution, mix well, allow to stand for 3 minutes. Add 0.8 ml of 2% N-(1-naphthyl)-ethylene-diamine dihydrochloride solution in dilute ethanol, mix well, allow to stand for 2 minutes. Maintain the temperature at 20°C throughout the tests. The absorbance of the resulting solution at 518 nm is not more than 0.11 (Appendix IV A).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition No more than 0.1% (Appendix VIII N), using 1.0 g and a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Weigh accurately about 0.2 g and dissolve in 40 ml of dimethylformamide, add 3 drops of azo violet IS. Titrate in

an atmosphere of N_2 with sodium methoxide (0.1 mol/L) VS until a blue colour is produced. Perform a blank determination and make any necessary correction. Each ml of sodium methoxide (0.1 mol/L) VS is equivalent to 21.07 mg of $C_{15}H_{14}F_3N_3O_4S_2$.

Category Diuretic.

Storage Preserve in tightly closed containers.

Preparation Bendrofluazide Tablets

Bendrofluazide Tablets

Bendrofluazide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of bendrofluazide ($C_{15}H_{14}F_3N_3O_4S_2$).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets equivalent to about 50 mg of bendrofluazide in 5 ml of acetone with shaking, filter, evaporate the filtrate to dryness on a water bath. The residue complies with test (1), (2) and (5) for Identification described under Bendrofluazide.

Content uniformity Comply with the requirements (Appendix X E).

Pulverize 1 tablet in a mortar. Triturate with a quantity of 0.4% sodium hydroxide solution and transfer it to 25 ml volumetric flask with 0.4% sodium hydroxide solution, shake thoroughly, dilute with 4% sodium hydroxide solution to volume, mix well. Filter, measure accurately 2 ml of successive filtrate in another 25 ml volumetric flask, dilute to volume and mix well. Measure the absorbance (Appendix IV A) as described under Assay and calculate the content of $C_{15}H_{14}F_3N_3O_4S_2$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to 15 mg of bendrofluazide in a 100 ml volumetric flask. Shake frequently with 0.4% sodium hydroxide solution for 10 minutes and then dilute to volume with 0.4% sodium hydroxide solution, mix well. Filter, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute to volume with water and mix well. Measure the absorbance at 274 nm (Appendix IV A). Weigh accurately a quantity of bendrofluazide CRS, add 0.01 mol/L sodium hydroxide solution to produce a solution of 15 µg per ml. Measure the absorbance in the same manner, calculate the content of $C_{15}H_{14}F_3N_3O_4S_2$.

Category As described under Bendrofluazide.

Strength 5 mg

Storage Preserve in tightly closed containers.

Benorilate

$C_{17}H_{15}NO_5$ 313.31

[5003-48-5]

Benorilate is 4-acetamidophenyl acetylsalicylate. It contains not less than 98.5% of $C_{17}H_{15}NO_5$, calculated on dried basis.

Description White crystal or crystalline powder; odourless, tasteless.

Freely soluble in boiling ethanol; soluble in boiling methanol; slightly soluble in methanol or ethanol; insoluble in water.

Melting range 177-181°C (Appendix VI C).

Identification (1) To about 0.2 g add 5 ml of sodium hydroxide TS, boil and cool, filter. Acidify slightly the filtrate with a quantity of hydrochloric acid, add 2 drops of ferric trichloride TS; a violet colour is produced.

(2) The light absorption of a solution (Appendix IV A) obtained in the Assay exhibits a maximum at 240 nm. The absorption coefficient ($E_{1\%}^{1\text{cm}}$) is 730-760 calculated on the dried basis.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benorilate (Appendix XVI).

(4) To about 0.1 g add 5 ml of dilute hydrochloric acid, boil and cool, filter. The filtrate yields the reactions characteristic of primary aromatic amines (Appendix III).

Chlorides To 2.0 g add 100 ml of water, heat to boil and cool, add water to 100 ml, mix well and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5 ml of sodium chloride standard solution (0.01%).

Sulfates Carry out the limit test for sulfate (Appendix VIII B), using 25 ml of the remained filtrate obtained in test for chlorides. Any opalescence produced is not more pronounced than that of a reference solution using 1 ml of potassium sulfate standard solution (0.02%).

4-Amiophenol To 1.0 g add 20 ml of methanol solution (1→2), stir well, add 1 ml of alkaline sodium nitroprusside TS, mix well, allow to stand for 30 minutes; no bluish-green colour is produced.

Salicylic acid Dissolve 0.1 g in 5 ml of ethanol by heat, add a quantity of water, mix well, filter into a 50 ml cylinder, add water to volume and add immediately 1 ml of freshly prepared dilute ferric ammonium sulfate solution (to 1 ml of 1 mol/L hydrochloric acid solution, add 2 ml of ferric ammonium sulfate IS, add water to produce 100 ml), mix well; any colour produced in 30 seconds is not more intense than that of a reference solution (dissolve 0.1 g of salicylic acid, accurately weighed, in water, add 1 ml of glacial acetic acid, mix well, add water to produce 1000 ml, mix well. Measure accurately 1 ml, add 5 ml of ethanol, 44 ml of water and 1 ml of above freshly prepared dilute ferric ammonium sulfate, mix well) (0.1%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of methylene dichloride-ether-glacial acetic acid (80:15:4) as the mobile phase. Apply separately to the plate 10 µl each of four solutions in a mixture of chloroform-methanol (9:1), containing (1) 40 mg per ml (2) 0.4 mg per ml of substance being examined (3) 80 µg per ml of substance being examined (4) 80 µg per ml of paracetamol. After developing and removal of the plate, dry it in air, examine under an ultraviolet light (254 nm). The secondary spots in the chromatogram obtained with solution (1) are not more than four spots and not more intense than the corresponding spots obtained with solution (4). The secondary spots in the chromatogram obtained with solution (1) above the

principal spot are not more intense than the principal spot obtained with solution (2) and the other secondary spots are not more intense than the principal spot obtained with solution (3).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2) using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay dissolve a quantity, accurately weighed, in dehydrated ethanol, and dilute to produce a solution of about 7.5 µg per ml, measure the absorbance at 240 nm (Appendix IV A). Proceed as the same procedure, using benorilate CRS, accurately measured. Calculate the content of $C_{17}H_{15}NO_5$.

Category Antipyretic, anti-inflammatory and analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Benorilate Tablets

Benorilate, Pseudoephedrine Hydrochloride and Chlorphenamine Maleate Tablets

Benorilate, Pseudoephedrine Hydrochloride and Chlorphenamine Maleate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of benorilate ($C_{17}H_{15}NO_5$), pseudoephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$) and chlorphenamine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

Formula	
Benorilate	300 g
Pseudoephedrine Hydrochloride	30 g
Chlorphenamine Maleate	2 g
Exipient	a quantity
to make	1000 tablets

Description White tablets.

Identification (1) The retention time of principal peaks of pseudoephedrine hydrochloride and chlorphenamine maleate in the substance being examined in the chromatogram obtained in the Assay of pseudoephedrine hydrochloride and chlorphenamine maleate are identical with that of principal peaks of pseudoephedrine hydrochloride CRS and chlorphenamine maleate CRS in the chromatogram of the reference solution correspondingly.

(2) The retention time of principal peak of benorilate in the substance being examined in the chromatogram obtained in the Assay of benorilate is identical with that of principal peak of benorilate CRS in the chromatogram of the reference solution.

Content uniformity Carry out the method for content uniformity (Appendix X E). Triturate and transfer 1 tablet with 80 ml of 50% ethanol solution to a 100 ml volumetric flask, ultrasonic for 5 minutes, dilute to volume with water, mix well and filter. Carry out the procedure described under the Assay of chlorphenamine maleate using the successive filtrate. Calculate the content of $C_{16}H_{19}ClN_2 \cdot$

$C_4H_4O_4$. The limit of content uniformity is $\pm 20\%$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of 1% sodium dodecyl sulphate solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Measure accurately 5 ml of the successive filtrate into a 50 ml volumetric flask, dilute to volume with anhydrous ethanol, and mix well; Dissolve about 15 mg of benorilate CRS accurately weighed, in a quantity of anhydrous ethanol in a 100 ml volumetric flask, dilute to volume with anhydrous ethanol, mix well, measure accurately 5 ml to a 25 ml volumetric flask, add 2.5 ml of 1% sodium dodecyl sulphate solution, dilute to volume with anhydrous ethanol, mix well. Measure the absorbances of the resulting solutions at 280 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{15}NO_5$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements of tablets (Appendix I A).

Assay Benorilate Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with phenylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 245 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of benorilate.

Procedure Weigh accurately and powder 20 tablets. Transfer a quantity of the powder equivalent to about 50 mg of benorilate, accurately weighed, to a 100 ml volumetric flask, add 1 ml of 1% sodium dodecyl sulphate solution and 50 ml of methanol, ultrasonic for 5 minutes to dissolve benorilate, dilute to volume with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute to volume with mobile phase, mix well. Inject 20 μ l of the resulting solution into the column, and record the chromatogram. Repeat the operation, using benorilate CRS instead of the substance being examined, calculate the content of $C_{17}H_{15}NO_5$.

Pseudoephedrine Hydrochloride and Chlorphenamine Maleate Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-methanol-water-glacial acetic acid (37 : 36 : 27 : 0.3) (containing 0.35% sodium dodecyl sulphate) as the mobile phase. The column temperature is maintained at 30°C. Detection wavelength is 260 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of chlorphenamine. The resolution factor between the peaks of pseudoephedrine and chlorphenamine complies with related requirements.

procedure Transfer a quantity of the powder equivalent to about 24 mg pseudoephedrine hydrochloride and 1.6mg of chlorphenamine maleate, accurately weighed, to a 100 ml volumetric flask, add 80 ml of 50% ethanol solution, ultrasonic for 5 minutes to dissolve pseudoephedrine hydrochloride and chlorphenamine maleate, dilute to volume with water, mix well and filter. Inject 20 μ l of the successive filtrate into the column, and record the chromatogram; Dissolve a quantity of pseudoephedrine hydrochloride CRS and chlorphenamine maleate CRS, accurately weighed, in 50% ethanol solution and dilute to produce a solution of about 0.24 mg pseudoephedrine hydrochloride and 0.016 mg chlorphenamine maleate per ml, repeat the operation, calculate the content of $C_{10}H_{15}NO \cdot HCl$ and $C_{16}H_{19}ClH_2 \cdot C_4H_4O_4$ respectively with respect to the peak areas obtained in the chromatogram by the external

standard method.

Category Analgesic and antipyretic, non-steroids anti-inflammatory, vasoconstrictor, histamine H_2 receptor antagonist.

Storage Preserve in tightly closed containers, protected from light.

Benorilate Tablets

Benorilate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of benorilate ($C_{17}H_{15}NO_5$).

Description White tablets.

Identification A quantity of the finely powdered tablets complies with the tests for Identification (1) (4) described under Benorilate.

Dissolution Comply with the requirement for dissolution test (Appendix X C, method 2), using 1000 ml of 1% sodium laurylsulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 90 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute 2 ml of the successive filtrate, accurately weighed, with water to 100 ml, mix well as the test solution; Dissolve 20 mg of benorilate CRS, accurately weighed, in anhydrous ethanol to make 50 ml, dilute 2 ml with 0.025% sodium laurylsulfate solution to 100 ml as the reference solution. Measure the absorbances of the resulting solutions at 240 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{15}NO_5$ from each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. Dissolve a quantity of the powder equivalent to about 15 mg of Benorilate in a 100 ml volumetric flask with dehydrated ethanol, by gently warm and shaking. Cool, dilute with anhydrous ethanol to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to 100 ml volumetric flask, dilute with dehydrated ethanol to volume and mix well. Measure the absorbance of the resulting solution at 240 nm (Appendix IV A). Calculate the content of $C_{17}H_{15}NO_5$, taking 745 as the value of A (1%, 1 cm).

Category As described under Benorilate.

Strength (1) 0.2 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Benproperine Phosphate

$C_{21}H_{27}NO \cdot H_3PO_4$ 407.44

[2156-27-6]

Benproperine phosphate is 1-[2-(2-benzy-

lphenoxy)-1-methylethyl] piperidine phosphate. It contains not less than 98.5% of $C_{21}H_{27}NO \cdot H_3PO_4$, calculated on the dried basis.

Description A white or almost white powder; with a faint characteristic odour; taste, bitter.

Freely soluble in water; sparingly soluble in ethanol, chloroform or benzene; insoluble in acetone or ether.

Melting range 148-153°C (Appendix VI C).

Identification (1) Dissolve 20 mg in 5 ml of water, add 1 ml of dilute hydrochloric acid and 3-5 drops of ammonium reineckate TS (or a few granules), a pink precipitate is formed.

(2) Dissolve a quantity in 0.5 ml of water, add 3 ml of 0.2% *p*-dimethylaminobenzaldehyde TS, mix well. A pink or red colour is produced after a few minutes.

(3) Dissolve a quantity in 1 ml of water, add 5 drops of dilute nitric acid and then 1 ml of sulfuric acid alongside the tube wall to form a subjacent layer, a grey bluish violet film and a purple ring are formed at the junction of the liquids.

(4) Dissolve about 20 mg in 5 ml of water, add 1 ml of dilute nitric acid and 1 ml of ammonium molybdate TS, a yellow precipitate is produced on heating.

(5) The light absorption of 0.01% aqueous solution exhibits two maxima at 270 nm and 276 nm (Appendix IV A).

(6) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benproperine phosphate (Appendix XVI).

Clarity and colour of solution A solution of 0.50 g in 25 ml of water is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution (Dilute 12.5 ml of reference solution Y_3 with water to 25 ml) (Appendix IX A).

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.50 g, any opalescence produced is not more intense than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica H as the coating substance (with the binder of 0.1% carboxymethyl-cellulose sodium, thickness is 5 nm) and a mixture of butanol-concentrated ammonia solution (30:1) as the mobile phase. Apply separately to the plate 10 μ l of each of two solutions in methanol containing (1) 10 mg per ml, (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and visualize in iodine vapour. Any spot, other than the principal spot in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Barium Dissolve 2.0 g in 8 ml of water and 2 ml of dilute hydrochloric acid [filter with the filter paper washed by hydrochloric acid solution (1→40), if necessary], add 1 ml of dilute sulfuric acid. Any opalescence produced is not more intense than that of reference solution prepared by diluting 5.0 ml of barium standard solution [dilute 1 ml of 0.178% barium chloride ($BaCl_2 \cdot 2H_2O$) solution with water to 100 ml, mix well. It contains 10 μ g of Ba] with water to 10 ml, add 1 ml of dilute sulfuric acid and allow to stand for 30 minutes (0.0025%).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Iron Dissolve 1.0 g in 30 ml of water in a separator, add 4 ml of dilute hydrochloric acid and 50 mg of ammonium persulfate. Add 3 ml of 30% ammonium thiocyanate solution and mix well, add 50 ml of butanol, shake thoroughly,

allow to stand until the extract separates into two layers. Transfer 25 ml of the butanol layer to a Nessler cylinder. Any colour produced is not more intense than that of reference solution prepared in the same manner using 2.0 ml of standard iron solution (0.002%).

Heavy metals Dissolve 1.0 g in a quantity of water, add 0.5 g of ascorbic acid, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid and 4 ml of acetic anhydride, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 40.74 mg of $C_{21}H_{27}NO \cdot H_3PO_4$.

Category Antitussive.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Benproperine Phosphate Capsules
(2) Benproperine Phosphate Granules
(3) Benproperine Phosphate Oral Solution
(4) Benproperine Phosphate Tablets

Benproperine Phosphate Capsules

Benproperine Phosphate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of benproperine phosphate calculated as benproperine ($C_{21}H_{27}NO$).

Identification (1) Comply with the tests for Identification described under Benproperine Phosphate Tablets, using the contents of the capsules.

(2) To a quantity of the contents of the capsules equivalent to about 40 mg of benproperine phosphate, add 10 ml of water to dissolve benproperine phosphate and filter. To 5 ml of the filtrate add 1 ml of dilute nitric acid and 1 ml of ammonium molybdate TS, a yellow precipitate is produced on heating.

(3) Transfer a quantity of the contents of the capsules equivalent to about 10 mg of benproperine phosphate to a 100 ml volumetric flask, add a quantity of water to dissolve benproperine phosphate, dilute to volume, mix well and filter. The light absorption of the filtrate exhibits two maxima at 270 nm and 276 nm. (Appendix IV A)

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 10 mg of benproperine phosphate in a 100 ml volumetric flask add a quantity of water and shake to dissolve benproperine phosphate, dilute with water to volume and mix well, filter with a No.5 sintered glass funnel. Measure the absorbance of the successive filtrate at 270 nm (Appendix IV A). Dissolve an accurately weighed quantity of benproperine phosphate CRS in water to produce a solution of 0.1 mg per ml. Measure the absorbance in the same manner. Calculate the content of $C_{21}H_{27}NO \cdot H_3PO_4$ and multiply the result by 0.7594.

Category As described under Benproperine Phosphate.

Strength 20 mg (Calculated as $C_{21}H_{27}NO$)

Storage Preserve in tightly closed containers, protected from light.

Benproperine Phosphate Granules

Benproperine Phosphate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of benproperine ($C_{21}H_{27}NO$).

Description Soluble granules; taste, sweet.

Identification (1) A quantity of powdered granules complies with the tests (1) and (4) for Identification described under Benproperine Phosphate.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of benproperine phosphate CRS.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 80°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other Requirements Comply with the general requirement for granules (Appendix I N).

Assay Carry out the method for high performance chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.1 mol/L ammonium acetate BS (dissolve 7.7 g of ammonium acetate in 800 ml of water, adjust to pH 3.3 with glacial acetic acid, add water to 1000 ml) (65:35) as the mobile phase. Detection wavelength is 270 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of benproperine phosphate.

Procedure Weigh accurately a quantity of the powdered and mixed contents, equivalent to about 20 mg of benproperine phosphate, obtained in the test for weight variation into a 50 ml volumetric flask, dissolve benproperine phosphate with 20 ml of water, add 2.5 ml of 2% sodium hydroxide solution, shake for 1 minute until a white precipitate is produced, add 10 ml of 4% phosphoric acid solution to make the precipitate disappear, dilute with water to volume, mix well and filter, take the successive filtrate as test solution. Inject 10 µl of the test solution into the column, record the peak areas correspondingly obtained in the chromatogram. Repeat the operation, using a reference solution containing 0.4 mg of benproperine phosphate CRS per ml in mobile phase. Calculate the content of $C_{21}H_{27}NO \cdot H_3PO_4$ with respect to the peak area obtained in the chromatogram by the external standard method and multiply the result by 0.7594.

Category As described under Benproperine Phosphate.

Strength 20 mg (calculated as $C_{21}H_{27}NO$)

Storage Preserve in tightly closed containers, stored in a dry place.

Benproperine Phosphate Oral Solution

Benproperine Phosphate Oral Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of benproperine ($C_{21}H_{27}NO$).

Description A slightly yellow to pale brownish-yellow viscous liquid; taste, numb.

Identification (1) To a quantity, equivalent to about 2 mg of benproperine phosphate, add 3 ml of water and 1 ml of dilute hydrochloric acid, add dropwise ammonium reineckate

TS a pink precipitate is formed.

(2) The retention time of the principal peak in the chromatogram of the test preparation obtained under the Assay corresponds with that of the principal peak in the chromatogram of the reference preparation.

pH value 3.0-5.0 (Appendix VI H).

Relative density Not less than 1.08 (Appendix VI A).

Other Requirements Complies with the general requirement for oral solution (Appendix I O).

Assay Carry out the method for high performance chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.1 mol/L ammonium acetate BS (dissolve 7.7 g of ammonium acetate in 800 ml of water, adjust to pH 3.3 with glacial acetic acid, add water to 1000 ml) (65:35) as the mobile phase. Detection wavelength is 270 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of benproperine phosphate.

Procedure Measure accurately a quantity of the substance being examined, equivalent to about 20 mg of benproperine phosphate, into a 50 ml volumetric flask, dissolve benproperine phosphate with the mobile phase, and dilute with the same solution to volume as test solution. Inject 10 µl of the test solution into the column, record the peak areas correspondingly obtained in the chromatogram. Repeat the operation, using a reference solution containing 0.4 mg of benproperine phosphate CRS per ml in mobile phase. Calculate the content of $C_{21}H_{27}NO \cdot H_3PO_4$ with respect to the peak area obtained in the chromatogram by the external standard method and multiply the result by 0.7594.

Category As described under Benproperine Phosphate.

Strength (1) 10 ml:10 mg (2) 10 ml:20 mg
(3) 80 ml:80 mg (4) 100 ml:100 mg
(5) 100 ml:200 mg
(6) 120 ml:120 mg (calculated as $C_{21}H_{27}NO$)

Storage Preserve in tightly closed containers, protected from light.

Benproperine Phosphate Tablets

Benproperine Phosphate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of benproperine phosphate calculated as benproperine ($C_{21}H_{27}NO$).

Description White tablets or sugar coated tablets or film coated tablets with white cores.

Identification (1) Comply with test (1), (2) and (3) for Identification described under Benproperine Phosphate, using a quantity of the powdered tablets.

(2) To a quantity of the powdered tablets equivalent to about 40 mg of benproperine phosphate add 10 ml of water to dissolve benproperine phosphate, filter. To 5 ml of the filtrate add 1 ml of dilute nitric acid and 1 ml of ammonium molybdate TS, a yellow precipitate is formed on heating.

(3) Transfer a quantity of the powdered tablets equivalent to about 10 mg of benproperine phosphate to a 100 ml volumetric flask, add a quantity of water to dissolve benproperine phosphate, dilute to volume, mix well and filter. The light absorption of the filtrate exhibits two maxima at 270 nm and 276 nm (Appendix IV A).

Other requirements Comply with the general requirements

for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with the coating removed. To an accurately weighed quantity of the powder equivalent to about 10 mg of benproperine phosphate in a 100 ml volumetric flask add a quantity of water and shake to dissolve benproperine phosphate, dilute with water to volume and mix well, filter with a No. 5 sintered glass funnel. Measure the absorbance of the successive filtrate at 270 nm (Appendix IV A). Dissolve an accurately weighed quantity of benproperine phosphate CRS in water to produce a solution of 0.1 mg per ml. Measure the absorbance in the same manner. Calculate the content of $C_{21}H_{27}NO \cdot H_3PO_4$ and multiply the result by 0.7594.

Category As described under Benproperine Phosphate.

Strength 20 mg (Calculated as $C_{21}H_{27}NO$)

Storage Preserve in tightly closed containers, protected from light.

Benserazide Hydrochloride

$C_{10}H_{15}N_3O_5 \cdot HCl$ 293.71 [14919-77-8]

Benserazide Hydrochloride is 2- [2,3,4 - (tri - hydroxyphenyl) methyl] hydrazidyl - DL - serine hydrochloride. It contains not less than 95.0% and not more than 102.0% of $C_{10}H_{15}N_3O_5 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; hygroscopic; colour darkens on exposure to light. Freely soluble in water; sparingly soluble in methanol; insoluble in ethanol or acetone.

Identification (1) Dissolve a small quantity in 2 ml of water in a clean test tube, add 1 ml of ammoniacal silver nitrate TS, a brown colour is produced, silver sets free and forms a silver mirror on the tube wall on heating in a water bath.

(2) Dissolve a quantity in 2 ml of water, add 1 ml of ferric chloride TS, a brownish-green colour is produced.

(3) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of benserazide hydrochloride CRS.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benserazide hydrochloride (Appendix XVI).

(5) An aqueous solution yields reactions characteristic of chlorides (Appendix III).

Related substances Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 1.5 mg per ml (solution 1), measure accurately 2 ml, dilute with mobile phase to 100 ml and mix well (solution 2). Carry out the method as described under the Assay. Inject 10 μ l of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10%-15% of the full scale of the chart. Inject separately 20 μ l of above two solutions, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than

the principal peak in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight under reduced pressure in a desiccator over phosphorus pentoxide, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of trifluoroacetic acid-methanol-water (1 : 20 : 1000) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of benserazide hydrochloride. The resolution factor between benserazide hydrochloride and dopamine complies with the related requirements.

Internal standard solution Dissolve a quantity of dopamine hydrochloride in mobile phase and dilute to a solution of 7 mg per ml.

Procedure Transfer about 15 mg, accurately weighed, into 50 ml amber-coloured volumetric flask, add 5 ml of internal standard solution, accurately measured, dilute with mobile phase to volume and mix well, inject 10 μ l into the column. Repeat the operation, using benserazide hydrochloride CRS instead of the substance being examined, calculate the content of $C_{10}H_{15}N_3O_5 \cdot HCl$.

Category Decarboxylase inhibitor.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Levodopa and Benserazide Hydrochloride Capsules (2) Levodopa and Benserazide Hydrochloride Tablets

Benzalkonium Bromide

[1050-48-2]

Benzalkonium Bromide is a mixture of alkyl-benzyl-dimethylammonium bromides; It contains not less than 95.0% and not more than 105.0% of alkylbenzyl-dimethylammonium bromides, calculated as $C_{22}H_{40}BrN$ on the anhydrous basis.

Description Yellow gel or gelatinous masses. At low temperature it may form a waxy solid gradually. The aqueous solution yields alkaline reaction, foams on shaking. Freely soluble in water or ethanol; slightly soluble in acetone; insoluble in ether or benzene.

Identification (1) Dissolve about 0.2 g in 1 ml of sulfuric acid, add 0.1 g of sodium nitrate, heat on a water bath for 5 minutes, cool. Add 10 ml of water and 0.5 g of zinc powder, warm on a water bath for 5 minutes. To 2 ml of the supernatant add 1 ml of 5% sodium nitrite solution, cool in an ice bath, add 3 ml of alkaline β -naphthol TS, an reddish-orange colour is produced.

(2) To 10 ml of a 1% solution, add 0.5 ml of dilute nitric acid, a white precipitate is formed. Filter, the precipitate dissolves easily in ethanol, and the filtrate yields the reactions characteristic of bromides (Appendix III).

Ammonium compounds Heat 5 ml of a 2% solution (2 \rightarrow 100) with 3 ml of sodium hydroxide TS to boil. No ammonia odour is perceptible.

Non-quaternary ammonium compound Dissolve 4.0 g in sufficient water to produce 100 ml. Transfer 25.0 ml of the

solution to a separator, add 25 ml of chloroform, 10 ml of sodium hydroxide solution (0.1 mol/L) VS, and 10 ml of a freshly prepared 5% potassium iodide solution, accurately measured, shake and allow to stand until separation takes place. Wash the aqueous layer with three portions of 10 ml each of chloroform, discard the chloroform layers. To the aqueous layer add 40 ml of hydrochloric acid, cool, add 40 ml of 50% potassium bromide solution and titrate with potassium iodate (0.05 mol/L) VS until the solution becomes pale brown. Add 2 ml of chloroform, continue the titration with shaking until the red colour of the chloroform layer disappears. Transfer 25.0 ml of above benzalkonium bromide solution to another separator, add 25 ml of chloroform and 10 ml of 0.1 mol/L hydrochloric acid solution, proceed as described above, beginning with the addition of freshly prepared 5% potassium iodide solution. The difference of the amount of potassium iodate (0.05 mol/L) VS consumed between the two titrations is not more than 0.5 ml.

Water Not more than 10.0% (Appendix VIII M, method 1 A).

Assay Transfer accurately about 0.25 g to a stoppered conical flask, add 50 ml of water and 1 ml of sodium hydroxide TS, shake thoroughly. Add 0.4 ml of bromophenol blue IS and 10 ml of chloroform, titrate with sodium tetraphenylborate (0.02 mol/L) VS, shaking vigorously towards the end of titration until the blue colour of the chloroform layer disappears. Each ml of sodium tetraphenylborate (0.02 mol/L) VS is equivalent to 7.969 mg of $C_{22}H_{40}BrN$.

Category Antiseptic disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Benzalkonium Bromide Solution

Benzalkonium Bromide Solution

Benzalkonium Bromide Solution is an aqueous solution of benzalkonium bromide. It contains not less than 4.75% and not more than 5.25% of alkylbenzyltrimethylammonium bromides, calculated as $C_{22}H_{40}BrN$.

Description A clear, colourless to pale yellow liquid; odour, aromatic; taste, very bitter. Foams on vigorous shaking. An opalescence or a sediment may appear at low temperature.

Identification Evaporate 6 ml on a water bath to dryness, the residue complies with the tests for Identification described under Benzalkonium Bromide.

Assay Carry out the Assay described under Benzalkonium Bromide, using 5 ml, accurately measured.

Category As described under Benzalkonium Bromide.

Storage Preserve in well closed containers, protected from light.

Benzalkonium Chloride

[8001-54-5]

Benzalkonium Chloride is a mixture of alkylbenzyltrimethylammonium chlorides. It contains

not less than 95.0% and not more than 105.0% of alkylammonium salts, calculated as $C_{22}H_{40}ClN$ on the anhydrous basis.

Description A white waxy solid or yellow gelatinous mass. The aqueous solution yields neutral or weakly alkaline reaction, foams on shaking.

Very soluble in water or ethanol; slightly soluble in ether.

Identification (1) Dissolve about 0.2 g in 1 ml of sulfuric acid, add 0.1 g of sodium nitrate, heat on a water bath for 5 minutes and cool. Add 10 ml of water and 0.5 g of zinc powder, warm on a water bath for 5 minutes. To 2 ml of the supernatant liquid add 1 ml of 5% sodium nitrite solution, cool in an ice bath, add 3 ml of alkaline β -naphthol TS, a scarlet colour is produced.

(2) The light absorption of a solution of 0.5 mg per ml in water exhibits three maxima at 257 nm, 262 nm and 269 nm (Appendix IV A).

(3) To 10 ml of 1% solution add 0.5 ml of dilute nitric acid, a white precipitate is formed. Filter, the precipitate dissolves in ethanol, and the filtrate yields the reactions characteristic of chlorides (Appendix III).

Water insoluble matter Dissolve 1.0 g in 10 ml of water, no turbidity is produced and no insoluble matter is observed.

Ammonium Compounds Dissolve 0.1 g in 5 ml of water, add 3 ml of sodium hydroxide TS, heat to boil; no ammonia odour is perceptible.

Water Carry out the determination of water (Appendix VIII M, method 1 A): not more than 10.0%.

Assay Weigh accurately about 0.5 g in a beaker, transfer to a 250 ml separator with the aid of 35 ml of water in portions. Add 10 ml of 0.1 mol/L sodium hydroxide solution, 25 ml of chloroform and measured accurately 10 ml of freshly prepared 5% potassium iodide solution. Shake and allow to stand until separation takes place. Extract the aqueous layer with 10 ml each of chloroform for 3 times, discard the chloroform layers. Transfer the aqueous layer to a 250 ml conical flask with stopper, rinse the separator with about 15 ml of water in three portions, combine the washing solutions and aqueous solution. Add 40 ml of hydrochloric acid, allow to cool, titrate with potassium iodate (0.05 mol/L) VS to light brown colour, add 5 ml of chloroform, shaking vigorously towards the end of titration until the colour of the chloroform layer just disappears. Perform a blank determination and make any necessary correction. Each ml of potassium iodate (0.05 mol/L) VS is equivalent to 35.40 mg of $C_{22}H_{40}ClN$.

Category Antiseptic disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Benzalkonium Chloride Solution

Benzalkonium Chloride Solution

Benzalkonium Chloride Solution is an aqueous solution of benzalkonium chloride. It contains not less than 95.0% and not more than 105.0% of the labelled amount of alkylammonium salts calculated as $C_{22}H_{40}ClN$.

Description A clear, colourless to pale yellow liquid; Odour, flavour; taste, very bitter; foams vigorously on shaking.

Identification Evaporate the solution on a water bath to dryness, the residue complies with the test for Identification described under Benzalkonium Chloride.

Ammonium salts To 1 ml of the solution in a test tube add 4 ml of water and 3 ml of sodium hydroxide TS, heat to boil; no ammonia odour is perceptible.

Assay Measure accurately 5 ml of the solution equivalent to about 0.5 g of Benzalkonium Chloride and proceed the Assay described under Benzalkonium Chloride.

Category As described under Benzalkonium Chloride.

Strength 10%

Storage Preserve in well closed containers, protected from light.

Benzathine Benzylpenicillin

$(C_{16}H_{18}N_2O_4S)_2 \cdot C_{16}H_{20}N_2 \cdot 4H_2O$ 981.18

Benzathine benzylpenicillin is a sterile mixture of *N*, *N'*-dibenzylethane-1,2-diamine compound (1 : 2) with (2*S*, 5*R*, 6*R*)-3,3-dimethyl-7-oxo-6-[2-(phenylacetyl) amino]-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylic acid tetrahydrate. Dispersing or suspend agents may be added. It has a potency of not less than 1180 Benzylpenicillin Units per mg, calculated on the anhydrous basis.

Description A white crystalline powder.

Freely soluble in dimethylformamide and in formamide; slightly soluble in alcohol, very slightly soluble in water.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of benzylpenicillin CRS. (2) Shake about 0.2 g with 2 ml of sodium hydroxide TS, extract the mixture with 10 ml of ether, evaporate 3 ml of the ether extract to dryness and dissolve the residue in 2 ml of glacial acetic acid. Add 1 ml of potassium dichromate TS, a golden precipitate is formed. (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Benzathine Benzylpenicillin (Appendix XVI).

Acidity or alkalinity Suspend 50 mg in 10 ml of water, pH 5.0-7.5 (Appendix VI H).

***N,N'*-dibenzylethylenediamine** Dissolve about 1 g, accurately weighed, in 30 ml of saturated sodium chloride solution and 10 ml of 5 mol/L sodium hydroxide solution, mix well, transfer to separator and extract with four quantities, each of 50 ml of ether. Combine the ether extracts, wash with three quantities, each of 10 ml, of water. Combine the aqueous extracts and extract with 25 ml of ether. Combine the all ether extracts, evaporate the ether extracts to about 5 ml and add 2 ml of absolute ethanol, evaporate the above solution to dryness. Dissolve the residue in 50 ml of acetic acid glacial and 1 ml of 0.2% naphtholbenzein IS, titrate with perchloric acid (0.1 mol/L) VS until yellow solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L)

VS is equivalent to 12.02 mg of $C_{16}H_{20}N_2$. It contains not less than 24.0% and not more than 27.0% of *N,N'*-dibenzylethylenediamine, calculated on the anhydrous basis.

Water 5.0%-8.0% (Appendix VIII M, method 1 A).

Consistence Shake 1.5 g with 5 ml of water, mix well.

The aqueous suspension passes readily through a No. 5 $\frac{1}{2}$ hypodermic needle without blockage.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.25 EU per 1000 benzathine benzylpenicillin Units.

Sterility Complies with the test for sterility (Appendix XI H). Each portion is inactivated by penicillinase.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 ml/L phosphate buffer solution (dissolve 6.8 g of potassium dihydrogen phosphate in 900 ml of water, adjust the pH value with 1 mol/L sodium hydroxide solution to 6.0 and dilute with water to 1000 ml, mix well)-acetonitrile (75:25) as the mobile phase. Detection wavelength is 225 nm and the number of the theoretical plates of the column is not less than 2000, the flow rate is 1 ml per minute calculated with reference to the peak of benzylpenicillin. The resolution factor between the peaks of benzyl penicillin and the neighbor peaks complies with the related requirement.

Procedure Dissolve about 53 mg of benzathine benzylpenicillin, accurately weighed, in 10 ml of acetonitrile and 5 ml of methanol in a 50 ml volumetric flask, add the 0.05 ml/L phosphate buffer solution to volume, mix well. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using benzylpenicillin CRS instead of the substance being examined. Calculate the content of benzylpenicillin with respect to the peak area obtained in the chromatogram by the external standard method. Each mg of $C_{16}H_{18}N_2O_4S$ is equivalent to 1780 Benzylpenicillin Units.

Category β -lactam antibiotics, penicillins.

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Preparation Benzathine Benzylpenicillin for Injection

Benzathine Benzylpenicillin for Injection

Benzathine Benzylpenicillin for Injection is a sterile mixture of *N,N'*-dibenzylethylenediamine salt of benzylpenicillin [$(C_{16}H_{18}N_2O_4S)_2 \cdot C_{16}H_{20}N_2$] with suitable amount of buffer and suspension agent. It has a potency of not less than 1180 Benzylpenicillin Units per mg, calculated on the anhydrous basis. Each container contains not less than 95.0% and not more than 105.0% of the labelled amount of Benzylpenicillin, calculated on the basis of the average weight of contents.

Description A white crystalline powder.

Identification Complies with the tests for Identification described under Benzathine Benzylpenicillin.

Acidity or alkalinity, *N,N'*-dibenzylethylenediamine, Water, Consistence, Bacterial endotoxin and Sterility Complies with the corresponding tests described under Benzathine

Benzylpenicillin.

Other requirements Complies with the general requirements for injections (Appendix I B), except the weight variation is not more than $\pm 7\%$.

Assay Shake and dissolve about 53 mg, weighed accurately, of the mixed contents obtained in the test for weight variation of contents in a 50 ml volumetric flask in 10 ml of acetonitrile and 5 ml of methanol, dilute with 0.05 mol/L phosphate buffer solution to volume and mix well. Carry out the Assay described under Benzathine Benzylpenicillin. Each mg of $C_{16}H_{18}N_2O_4S$ is equivalent to 1780 Benzylpenicillin Unit.

Category As described under Benzathine Benzylpenicillin.

Strength (1) 300000 Units (2) 600000 Units
(3) 1200000 Units

Storage Preserve in tightly closed containers, stored in a dry place

Benzhexol Hydrochloride

$C_{20}H_{31}NO \cdot HCl$ 337.93

[52-49-3]

Benzhexol Hydrochloride is α -cyclohexyl- α -phenyl-1-piperidinepropanol hydrochloride. It contains not less than 98.0% of $C_{20}H_{31}NO \cdot HCl$, calculated on the dried basis.

Description A white, light crystalline powder; odourless; taste, slightly bitter then irritant and numbing. Soluble in methanol, ethanol or chloroform; slightly soluble in water.

Identification (1) Dissolve about 0.1 g in 5 ml of warm ethanol, make alkaline with sodium hydroxide TS dropwise, the precipitate thus produced is recrystallized from ethanol and dried. It melts at 112-116°C (Appendix VI C).

(2) The infrared spectrum (Appendix IV C) is concordant with the reference spectrum of benzhexol hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 50 ml of water by heating to about 80°C, cool; pH 5.0-6.0 (Appendix VI H).

Piperidylpropiofenone Dissolve 0.10 g in a mixture of 40 ml of water and 1 ml of hydrochloric acid solution (9→100) by heating, cool and add sufficient water to produce 100 ml. The light absorbance of the resulting solution at 247 nm is not more than 0.50 (Appendix IV A).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid, add 4 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 33.79 mg of $C_{20}H_{31}NO \cdot HCl$.

Category Anti-Parkinsonian.

Storage Preserve in tightly closed containers.

Preparation Benzhexol Hydrochloride Tablets

Benzhexol Hydrochloride Tablets

Benzhexol Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of benzhexol hydrochloride ($C_{20}H_{31}NO \cdot HCl$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 20 mg of benzhexol hydrochloride add 20 ml of water, shake to dissolve benzhexol hydrochloride and filter. Divide the filtrate into two portions. To one portion add trinitrophenol TS, a yellow precipitate is produced; To another portion add 20% sodium hydroxide solution, a white precipitate is produced.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (9:1) as the mobile phase. Apply separately to the plate 10 μ l each of two chloroform solution containing (1) 2 mg of the substance being examined per ml and (2) 2 mg of benzhexol hydrochloride CRS per ml. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with solution (1) corresponds in position with the principal spot obtained with solution (2).

Content uniformity Comply with the requirements (Appendix X E).

Shake 1 tablet with 6 ml of water in a 50 ml flask with stoppered, add 2 ml of dilute sulfuric acid, 10 ml of chloroform, and 0.2 ml of dimethyl yellow-methylene blue IS. Titrate with 0.05% sodium dioctyl sulfosuccinate solution, shake vigorously towards the end of titration, continue to titrate until the chloroform layer changes from green to reddish-grey. Dissolve about 20 mg of benzhexol hydrochloride CRS, accurately weighed, with 20 ml of dilute sulfuric acid in a 50 ml volumetric flask, dilute to volume with water and mix well. Transfer 5 ml of the solution, accurately measured, to a 50 ml flask with stopper, add 3 ml of water, 10 ml of chloroform and 0.2 ml of dimethyl yellow-methylene blue IS, titrate in the same manner as described above. Calculate the content of $C_{20}H_{31}NO \cdot HCl$ (Appendix X E).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 25 tablets. Weigh accurately a quantity of the powder equivalent to about 20 mg of benzhexol hydrochloride in a flask with stopper, add 8 ml of water, 3 ml of dilute sulfuric acid, 25 ml of chloroform and 0.5 ml of dimethyl yellow-methylene blue IS. Titrate with 0.25% sodium dioctyl sulfosuccinate solution, shake vigorously towards the end of titration, continue the titration until the chloroform layer changes from green to reddish-grey. Perform a titration in the same manner, using 20 mg of benzhexol hydrochloride CRS instead of the substance being examined. Calculate the content of $C_{20}H_{31}NO \cdot HCl$.

Category As described under Benzhexol Hydrochloride.

Strength 2 mg

Storage Preserve in tightly closed containers.

Benzocaine

$C_9H_{11}NO_2$ 165.19

[94-09-7]

Benzocaine is ethyl 4-aminobenzoate. It contains not less than 99.0% of $C_9H_{11}NO_2$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter and followed by a sensation of numbness; the colour becomes yellow gradually on exposure to light. Freely soluble in ethanol, chloroform or ether; sparingly soluble in fixed oils; very slightly soluble in water; soluble in diluted acids.

Melting point 88-91°C (Appendix VI C).

Identification (1) Boil 0.1 g with 5 ml of sodium hydroxide TS, ethanol is liberated. Then heat with iodine TS, a yellow precipitate is produced and the characteristic odour of iodoform is perceptible.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benzocaine (Appendix XVI).

(3) Yields the reaction characteristic of primary aromatic amines (Appendix III).

Acidity Dissolve 1.0 g in 10 ml of ethanol previously neutralized to phenolphthalein IS, add 2 drops of phenolphthalein IS. Not more than 0.10 ml of sodium hydroxide (0.1 mol/L) VS is required to produce a slightly pink colour.

Chloride Dissolve 0.2 g in 5 ml of ethanol, add 3 drops each of dilute nitric acid and silver nitrate TS, no opalescence is produced immediately.

Loss on drying When dried over phosphorous pentoxide in a desiccator to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the residue on ignition test: not more than 0.001%.

Assay Weigh accurately about 0.35 g, carry out the method for dead-stop titration (Appendix VIII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 16.52 mg of $C_9H_{11}NO_2$.

Category Local anesthetic.

Storage Preserve in tightly closed containers, protected from light.

Benzoic Acid

$C_7H_6O_2$ 122.12

[65-85-0]

Benzoic acid contains not less than 99.0% of $C_7H_6O_2$.

Description White light flakes with silky lustre or needle crystals or a crystalline powder, odourless, or almost odourless; slightly volatile in warm air; the aqueous solution exhibits an acidic reaction.

Freely soluble in ethanol, chloroform and ether; soluble in boiling water; slightly soluble in water.

Melting point 121-124.5°C (Appendix VI C).

Identification (1) To about 0.2 g add 15 ml of 4% sodium hydroxide solution, shake and filter. To the filtrate add 2 drops of ferric chloride TS, a reddish-brown precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benzoic acid (Appendix XVI).

Oxidizable substances Add 1.5 ml of sulfuric acid to 100 ml of water, heat to boil, add dropwise potassium permanganate (0.02 mol/L) VS until the pink colour persists for 30 seconds. Dissolve 1.0 g of the substance being examined in the hot solution, not more than 0.25 ml of potassium permanganate (0.02 mol/L) VS is required to produce a pink colour that persists for 15 seconds.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 22 ml of ethanol, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.25 g, accurately weighed, in 25 ml of dilute ethanol (neutral to phenolphthalein IS), add 3 drops of phenolphthalein IS and titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 12.21 mg of $C_7H_6O_2$.

Category Antiseptic disinfectant.

Storage Preserve in tightly closed containers.

Benzoyl Peroxide

$C_{14}H_{10}O_4$ 242.23

[94-36-0]

Benzoyl peroxide is hydrous dibenzoyl peroxide. It contains not less than 70.0% and not more than 77.0% of $C_{14}H_{10}O_4$, and not less than 20.0% of water.

Description A white crystalline powder; odour characteristic. Freely soluble in acetone or chloroform; sparingly soluble in methanol or ethanol; very slightly soluble in water.

Identification (1) The light absorption of a solution of 5 µg per ml in dehydrated ethanol exhibits maximum at 235 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benzoyl peroxide (Appendix XVI).

Chloride Carry out the limit test for chlorides (Appendix VIII A). To 100 mg, accurately weighed, in a 50 ml Nessler

cylinder add 15 ml of acetone to dissolve benzoyl peroxide, dilute to 25 ml with acetone. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.07%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-dichloromethane-glacial acetic acid (50:2:1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in acetone containing (1) 10 mg per ml and (2) 0.2 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Assay Anhydrous Benzoyl Peroxide Dissolve 0.25 g, accurately weighed, in a 250 ml iodine flask with 30 ml of acetone on shaking. Add 5 ml of potassium iodide TS, stopper and mix well, allow to stand in the dark for 15 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS until the colour disappears. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.11 mg of C₁₄H₁₀O₄.

Water Dissolve about 0.12 g, accurately weighed, in 5 ml of dimethylformamide. Add 20 ml of dehydrated methanol and 3 ml of dimethylformamide solution which contains 10% potassium iodide and stir for 5 minutes. Carry out the determination for water (Appendix VIII M, method 1 A). Calculate the content of water which is the result of the determination of water plus the content of anhydrous benzoyl peroxide multiplied by 0.0744.

Category Antiseptic disinfectant.

Storage Preserve in tightly closed containers, protected from light, stored with a quantity of moisture.

Preparation (1) Benzoyl Peroxide Cream
(2) Benzoyl Peroxide Gel

Benzoyl Peroxide Cream

Benzoyl Peroxide Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of benzoyl peroxide (C₁₄H₁₀O₄).

Description A white cream.

Identification To a quantity of benzoyl peroxide cream equivalent to 100 mg of benzoyl peroxide, add 10 ml of acetone, shake till well-dispersed and filter, use the filtrate as the test solution. Dissolve Benzoyl Peroxide CRS in acetone to produce a solution of 10 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-dichloromethane-glacial acetic acid (50:2:1) as the mobile phase. Apply separately to the plate 5 µl each of the two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (365 nm). The principal spots in the chromatogram obtained with the two solutions are identical in position and colour.

pH value 2.8-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for ointment (Appendix I F).

Assay Place a quantity of the cream equivalent to about 250 mg of benzoyl peroxide, accurately weighed, in a 100 ml conical flask with stopper, add 30 ml of acetone, shake till well-dispersed, add 5 ml of potassium iodide TS, stopper and shake for 1 minute. Titrate with sodium thiosulfate (0.1 mol/L) VS until the colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.11 mg of C₁₄H₁₀O₄.

Category As described under Benzoyl Peroxide.

Strength (1) 5% (2) 10%

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Benzoyl Peroxide Gel

Benzoyl Peroxide Gel contains not less than 90.0% and not more than 110.0% of the labelled amount of benzoyl peroxide (C₁₄H₁₀O₄).

Description A creamy white, viscous gel.

Identification (1) To a quantity of the substance being examined equivalent to about 50 mg of benzoyl peroxide, add 5 ml of acetone, extrude the specimen with a glass rod to dissolve benzoyl peroxide. Add 2 ml of potassium iodide TS; a reddish-brown colour is produced and it disappears upon the addition of 5 ml of thiosulfate TS.

(2) To a quantity of the substance being examined equivalent to about 100 mg of benzoyl peroxide, add 10 ml of acetone, extrude the specimen with a glass rod to dissolve benzoyl peroxide. Filter and use the filtrate as the test solution. Dissolve benzoyl peroxide CRS in acetone to produce a solution of 10 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-dichloromethane-glacial acetic acid (50:2:1) as the mobile phase. Apply separately to the plate 5 µl each of above two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with reference solution.

pH value 4.5-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for gel (Appendix I U).

Assay Transfer a quantity of the substance being examined equivalent to about 200 mg of benzoyl peroxide, accurately weighed, in a 100 ml conical flask with stopper, allow to stand for a few minutes so that distribute the specimen evenly in the bottom of the conical flask with stopper. Add 30 ml of acetone, extrude the specimen with a glass rod to dissolve benzoyl peroxide. Wash the glass rod with a small quantity of acetone and add the washings to the main solution. Add 5 ml of potassium iodide TS, stopper and mix well, allow to stand in the dark for 10 minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS until the colour disappears, shake vigorously for 30 seconds, allow to stand for 2 minutes and the end point is obtained if the solution is still colourless. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 12.11 mg of C₁₄H₁₀O₄.

Category As described under Benzoyl Peroxide.

Strength (1) 10 g±0.5 g (2) 18 g±0.9 g

Storage Preserve in tightly closed containers, stored in a cool place.

Benzyl Alcohol

C_7H_8O 108.14

[100-51-6]

Benzyl Alcohol contains not less than 98.0% of C_7H_8O .

Description A colourless liquid; odour, slightly characteristic; taste, burning. It oxidizes gradually to benzaldehyde and benzoic acid on exposure to air. Soluble in water, miscible with ethanol, chloroform or ether.

Relative density 1.043-1.050 (Appendix VI A).

Distilling range Carry out the determination of distilling range (Appendix VI B), not less than 95% (ml/ml) is distilled at 203-206°C.

Refractive index 1.538-1.541 (Appendix VI F).

Acidity Not more than 0.3 (Appendix VI H).

Identification (1) Add 2-3 drops to 2 ml of potassium permanganate TS and 2 ml of dilute sulfuric acid, mix well, the benzylaldehyde characteristic odour is perceptible. (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benzyl alcohol (Appendix XVI).

Benzaldehyde The substance being examined is used as the test solution. Weigh accurately about 50 mg of benzaldehyde to a 250 ml volumetric flask, add water to dissolve and dilute with water to volume, mix well, as the reference solution. Carry out the method for gas chromatography (Appendix V E), using a column packed with polyethylene glycol 20 M as the stationary phase (about 10%), and maintain the column temperature at 130°C. Inject separately into the column same volume each of two solutions, calculate the content of benzaldehyde. It is not more than 0.2%.

Solubility in water To 2 ml add 58 ml of water and shake, the solution is clear.

Organic chlorine compounds Burn a piece of copper plate in a nonluminous flame, until the green colour is disappeared, cool. Moisten the copper plate with the substance being examined and burn again in a nonluminous flame, no green colour is observed.

Assay To about 1.2 g, weighed accurately, add accurately 15 ml a mixture of acetic anhydride-pyridine (1:7), heat and reflux on a water bath for 30 minutes, cool. Add 25 ml of water and 2 drops of phenolphthalein IS, titrate with sodium hydroxide (1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 108.1 mg of C_7H_8O .

Category Local anesthetic, antiseptic-disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Benzylpenicillin Potassium

$C_{16}H_{17}KN_2O_4S$ 372.49

[113-98-4]

Benzylpenicillin Potassium is potassium (2S, 5R, 6R)-3,3-dimethyl-6-(2-phenylacetamido)-7-oxo-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate. It contains not less than 96.0% of penicillins, calculated as $C_{16}H_{17}KN_2O_4S$ on the anhydrous basis.

Description A white crystalline powder; odourless or slightly characteristic; hygroscopic; inactivated immediately by acid, alkaline or oxidizing agents. The aqueous solution loses its activity easily at room temperature. Very soluble in water; sparingly soluble in ethanol; insoluble in fixed oil or liquid paraffin.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of benzylpenicillin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benzylpenicillin potassium (Appendix XVI).

(3) Yields the flame reaction of potassium salts (Appendix III).

Light absorption The absorbance of an aqueous solution of 1.88 mg per ml at 280 nm (Appendix IV A) is not more than 0.10; the absorbance at the maximum at 264 nm is 0.80-0.88.

Acidity or alkalinity, Clarity and colour of solution, Water, Benzylpenicillin polymer, Bacterial endotoxin and Sterility Complies with the corresponding requirements described under Benzylpenicillin Sodium.

Assay Carry out the Assay described under benzylpenicillin sodium. Calculate the content with respect to the peak area obtained in the chromatogram by the external standard method, and multiply the result by 1.1136. Each mg of $C_{16}H_{17}N_2KO_4S$ is equivalent to 1598 benzylpenicillin Units.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed containers, protected from light and stored in a dry and cool place.

Preparation Benzylpenicillin Potassium for Injection

Benzylpenicillin Potassium for Injection

Benzylpenicillin Potassium for Injection is a sterile crystalline powder of benzylpenicillin potassium. It contains not less than 96.0% of $C_{16}H_{17}KN_2O_4S$, calculated as basis anhydrous. It contains not less than 95.0% and not more than 115.0% of the labelled amount of benzylpenicillin potassium,

calculated on the basis of the average weight of contents.

Description A white crystalline powder.

Identification Complies with the tests for Identification described under Benzylpenicillin Potassium.

Clarity and colour of solution Complies with the corresponding test described under Benzylpenicillin Sodium for Injection.

Benzylpenicillin polymer Carry out the test for benzylpenicillin polymer described under Benzylpenicillin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. The benzylpenicillin polymer is not more than 0.10%.

Water Not more than 1.0% (Appendix VIII M, method 1 A).

Acidity or alkalinity, Bacterial endotoxin and Sterility Complies with the corresponding requirements described under Benzylpenicillin Sodium.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay described under Benzylpenicillin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. Each mg of $C_{16}H_{17}N_2KO_4S$ is equivalent to 1598 benzylpenicillin Units.

Category As described under Benzylpenicillin Potassium.

Strength (1) 0.125 g (200000 Units)
(2) 0.25 g (400000 Units)
(3) 0.5 g (800000 Units)
(4) 0.625 g (1000000 Units)
(calculated as $C_{16}H_{17}KN_2O_4S$)

Storage Preserve in tightly closed containers, protected from light, stored in a dry and cool place.

Benzylpenicillin Sodium

$C_{16}H_{17}N_2NaO_4S$ 356.38

[69-57-8]

Benzylpenicillin Sodium is sodium (2*S*, 5*R*, 6*R*)-3,3-dimethyl-6-(2-phenylacetamido)-7-oxo-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate. It contains not less than 96.0% of penicillins, calculated as $C_{16}H_{17}N_2NaO_4S$ on the anhydrous basis.

Description A white crystalline powder; odourless or slightly characteristic; hygroscopic; inactivated immediately by acid, alkaline or oxidizing agents. The aqueous solution loses its activity easily at room temperature. Very soluble in water; soluble in ethanol; insoluble in fixed oils or liquid paraffin.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical

with that of benzylpenicillin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of benzylpenicillin sodium (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix III).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity or alkalinity An aqueous solution of 30 mg per ml, pH 5.0-7.5 (Appendix VI H).

Clarity and colour of solution To each of 5 portions add water to produce solutions of 60 mg per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of the reference suspension I (Appendix IX B); any colour produced is not more intense than that of the reference solution Y₁ or YG₁ (Appendix IX A, method 1).

Light absorption The absorbance of a solution of 1.80 mg per ml in water at 280 nm is not more than 0.10; the light absorption of the solution exhibits a maximum at 264 nm and the absorbance is 0.80-0.88 (Appendix IV A).

Benzylpenicillin polymer Carry out the method for column chromatography (Appendix V C), using a column with 1.3-1.6 cm in internal diameter and 30-40 cm height packed with sephadex G-10 (40-120 μ m), a 0.1 mol/L phosphate buffer solution [0.1 mol/L disodium hydrogen phosphate solution-0.1 mol/L dihydrogen phosphate sodium (61:39), pH 7.0] as mobile phase A and water as mobile phase B. The flow rate is 1.5 ml per minute and the detection wavelength is 254 nm. Inject 200 μ l of a solution of 0.1 mg/ml dextran blue 2000 per ml into the column separately using mobile A and mobile B. The number of the theoretical plates of the column is not less than 700 and the tailing factor is not more than 2.0, calculated with reference to the peak of dextran blue 2000, using mobile phase A and B as eluent. The ratio of retention time of dextran blue 2000 peaks in the two mobile phases is between 0.93-1.07. The ratio of retention time of the polymer peak of the test solution and the dextran blue 2000 peak is between 0.93-1.07 in mobile phase A. The ratio of retention time of the principle peak of reference solution and the dextran blue 2000 peak is between 0.93-1.07 in mobile phase B. The relative standard deviation (RSD) of the areas of the principal peak in chromatogram obtained with 200 μ l of the reference solution for five replicate injections is not more than 5.0%, using mobile phase B as the eluent.

Reference solution Dissolve an accurately weighed quantity of benzylpenicillin CRS 20 mg, in water to produce a solution of 0.1 mg per ml.

Procedure Dissolve an accurately weighed quantity of the substance being examined 0.4 g in a 10 ml volumetric flask, dilute to volume with water, mix well as test solution. Inject immediately 200 μ l into the column and record the chromatogram, using mobile phase A as the eluent. Inject 200 μ l the reference solution into the column and record the chromatogram, using mobile phase B as the eluent. The content of benzylpenicillin polymer is not more than 0.08%, calculate as benzylpenicillin with respect to the peak area obtained in the chromatogram by the external standard method.

Water Not more than 0.5% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.01 EU per 100 benzylpenicillin Units.

Sterility Complies with test for Sterility (Appendix XI H, membrane filtration method). Each portion is inactivated by penicillinase or dissolved in appropriate solvent, add not more than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1 mol/L potassium dihydrogen phosphate solution (adjust pH to 2.5 with phosphate acid) -acetonitrile (70 : 30), detection wavelength is 225 nm. The flow rate is 1.0 ml per minute. Dissolve a weighed quantity of benzylpenicillin CRS and 2-acetamide in water to produce a mixed solution of 0.2 mg per ml. Inject 20 μ l of the solution into the column, the number of the theoretical plate of the column is not less than 1600, calculated with reference to the peak of benzylpenicillin. The resolution factor between the peak of 2-acetamide and that of the benzylpenicillin is not less than 2.0. And The order of the peaks in the chromatogram is 2-acetamide and benzylpenicillin.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 0.5 mg per ml, mix well as the test solution. Inject 10 μ l of the test solution into the column and record the chromatogram. Repeat the operation, using benzylpenicillin CRS instead of the substance being examined. Calculate the content with respect to the peak area obtained in the chromatogram by the external standard method, and multiply the result by 1.7658. Each mg of $C_{16}H_{17}N_2NaO_4S$ is equivalent to 1670 benzylpenicillin units.

Category β -lactam antibiotic, penicillins.

Storage Preserve in hermetically sealed container, protected from light, stored in a dry and cool place.

Preparation Benzylpenicillin Sodium for Injection

Benzylpenicillin Sodium for Injection

Benzylpenicillin Sodium for Injection is a sterile powder of benzylpenicillin sodium. It contains not less than 96.0% of $C_{16}H_{17}N_2NaO_4S$, calculated as anhydrous basis. Each container contains not less than 95.0% and not more than 115.0% of the labelled amount of benzylpenicillin sodium, calculated on the basis of the average weight of contents.

Description A white crystalline powder.

Identification Complies with the tests for Identification described under Benzylpenicillin Sodium.

Clarity and colour of solution Add water to each of 5 containers to produce solutions of 60 mg per ml (calculated on the basis of labelled amount). The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Benzylpenicillin polymer Carry out the test for benzylpenicillin polymer described under benzylpenicillin sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. The benzylpenicillin polymer is not more than 0.10%.

Water Not more than 1.0% (Appendix VIII M, method 1 A).

Acidity or alkalinity, Bacterial endotoxin and Sterility

Complies with the corresponding requirements described under Benzylpenicillin Sodium.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the Assay described under benzylpenicillin sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. Each mg $C_{16}H_{17}N_2NaO_4S$ is equivalent to 1670 benzylpenicillin Units.

Category As described under Benzylpenicillin Sodium.

Strength (1) 0.12 g (200000 Units)
(2) 0.24 g (400000 Units)
(3) 0.48 g (800000 Units)
(4) 0.6 g (1000000 Units)
(5) 0.96 g (1600000 Units)
(6) 2.4 g (4000000 Units)
(calculated as $C_{16}H_{17}N_2NaO_4S$)

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Berberine Hydrochloride

$C_{20}H_{18}ClNO_4 \cdot 2H_2O$ 407.85

[633-65-8]

Berberine Hydrochloride is 5,6-dihydro-9,10-dimethoxy benzo [g]-1,3-benzodioxolo [5,6- α] quinolizinium hydrochlorate dihydrate. The extracted product contains not less than 97.0% of the alkaloid and the synthetic product contains not less than 98.0% of the alkaloid, both calculated as berberine hydrochloride ($C_{20}H_{18}ClNO_4$) on the dried basis.

Description A yellow crystalline powder; odourless; taste, very bitter.

Soluble in hot water; slightly soluble in water or ethanol; very slightly soluble in chloroform; insoluble in ether.

Identification (1) Dissolve 0.1 g in 10 ml of water on gentle heating, add 4 drops of sodium hydroxide TS, cool (filter if necessary), add 8 drops of acetone, a turbidity is produced immediately.

(2) Stir about 5 mg with 2 ml of dilute hydrochloric acid, add a small quantity of bleaching powder, a cherry-red colour is produced.

(3) Dissolve about 2 mg in 1 ml of sulfuric acid, add 5 drops of 5% solution of gallic acid in ethanol, heat on a water bath, an emerald colour is produced.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of berberine hydrochloride (Appendix XVI).

(5) Dissolve about 0.1 g in 20 ml of water on gently heating, add 0.5 ml of nitric acid, cool, allow to stand for 10 minutes and filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

Other alkaloids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G containing 0.1% of carboxymethylcellulose sodium as the coating substance and a mixture of ethyl acetate-chloroform-

methanol-diethylamine (8:2:2:1) as the mobile phase. Apply separately to the plate 3 μ l each of two solutions in ethanol containing (1) 2.0 mg per ml of the substance being examined and (2) 0.10 mg per ml of jatrorrhizine CRS. After developing and removal of the plate, examine immediately. The spot due to jatrorrhizine in the chromatogram obtained with solution (1) is not more intensely coloured than the principal spot obtained with solution (2). To another plate apply separately 3 μ l each of solution (1) and a 0.04 mg per ml solution of palmatine CRS in ethanol (solution 3), using *n*-butanol-glacial acetic acid-water (7:1:2) as the mobile phase. After developing and removal of the plate, dry it in air, examine the plate under ultraviolet light (365 nm). The fluorescent spot due to palmatine in the chromatogram obtained with solution (1) is not more intensely coloured than the principal spot obtained with solution (3) (extracted product).

Cyanide Comply with the limit test for cyanides (Appendix VIII F, method 1), using 0.5 g.

Organic nitrile Carry out the method for the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzen-glacial acetic acid (25:0.1) as the mobile phase. Shake 0.5 g of the substance being examined with 5 ml of dehydrated ether in a stoppered conical flask for 5 minutes, filter on a sintered glass funnel (G5) and wash with 3-4 portions of 2 ml each of dehydrated ether, combine the filtrate and washings, concentrate to about 0.5 ml (solution 1). Prepare a 0.1 mg per ml solution of piperacetone CRS in chloroform solution (2). Apply separately to the plate (0.5 mm in thickness) 10 μ l of solution (2) and all of solution (1), after developing and removal the plate, dry in air, spray with 5% of ammonium molybdate-sulfuric acid solution, and dry at 105°C for 10-20 minutes. No secondary spots in the chromatogram obtained with solution (1) correspond in position to the principal spot in the chromatogram obtained with solution (2) (Synthetic product).

Loss on drying When dried for 5 hours at 100°C, loses not more than 12.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (extracted product) or 0.1% (synthetic product), using 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using residue obtained in the test for Residue on ignition; not more than 0.002%. This test is applicable to synthetic product only.

Assay Dissolve about 0.3 g, accurately weighed, in a beaker in 150 ml of boiling water and allow to cool. Transfer the solution to a 250 ml volumetric flask, add accurately 50 ml of potassium dichromate (0.01667 mol/L) VS and dilute with water to volume. Shake for 5 minutes, filter with dry filter paper. Transfer accurately 100 ml of the successive filtrate to a 250 ml conical flask with glass stopper. Add 2 g of potassium iodide, shake to dissolve, then add 10 ml of hydrochloric acid solution (1→2), stopper tightly, shake well and allow to stand for 10 minutes in the dark. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration and continue to titrate until the blue colour disappears and a bright green colour is produced. Perform a blank determination and make any necessary correction. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 12.39 mg of $C_{20}H_{18}ClNO_4$.

Category Antibacterial.

Storage Preserve in tightly closed containers.

Preparation (1) Berberine Hydrochloride Capsules

(2) Berberine Hydrochloride Tablets

Berberine Hydrochloride Capsules

Berberine Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of labelled amount of berberine hydrochloride ($C_{20}H_{18}ClNO_4 \cdot 2H_2O$).

Identification Dissolve a quantity of contents (equivalent to about 0.1 g of berberine hydrochloride) in 10 ml of water, on heat gently and filter. The filtrate complies with the following tests.

(1) To 5 ml of filtrate add 2 drops of sodium hydroxide TS, an orange-red colour is produced. Cool, add 4 drops of acetone, a turbidity is produced immediately and yellow precipitate is produced on standing. To the supernatant liquid add a quantity of acetone to precipitate the alkaloid completely, filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

(2) Stir 0.5 ml of the filtrate with 2 ml of dilute hydrochloric acid, add a small quantity of bleaching powder, a cherry-red colour is produced.

(3) To 0.2 ml of filtrate add 1 ml of sulfuric acid in a white porcelain dish, add 3 drops of 5% solution of gallic acid in ethanol, heat on water bath, an emerald colour is produced.

Loss on drying When dried for 5 hours at 100°C, loses not more than 12.0% of its weight (Appendix VIII L).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium, adjust the rotational speed of the basket to 120 rpm. Withdraw 5 ml of the solution after exactly 45 minutes and filter. Dilute 2 ml of the successive filtrate to volume with water in a 25 ml volumetric flask and mix well. Measure the absorbance of the resulting solution at 263 nm (Appendix IX A). Calculate the dissolution of $C_{20}H_{18}ClNO_4 \cdot 2H_2O$ from each capsule, taking 724 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirement Comply with the general requirement for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer [0.05 mol/L potassium dihydrophosphate mixed with 0.05 mol/L heptane sodium sulfonate (1:1) containing 0.2% triethylamine, adjust to pH 3.0 with phosphoric acid]-acetonitrile (60:40) as the mobile phase. Detective wavelength is 263 nm, and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of berberine hydrochloride. The resolution factor between the peaks of berberine hydrochloride and adjacent peak should agree with the requirement.

Procedure Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 40 mg of berberine hydrochloride in proper boiling water in a 100 ml volumetric flask and cool to room temperature, dilute to volume with water, mix well, filter with filter membrane (0.45 μ m), discard about 8 ml of the initial filtrate. Transfer 2 ml of successive filtrate, accurately measured, into a 25 ml volumetric flask, dilute to volume with water, mix well. Inject 20 μ l into the column and record the chromatogram. Dissolve an accurately weighed quantity of berberine hydrochloride CRS in boiling water and dilute with boiling water to produce a solution of

about 32 μg per ml. Repeat the operation, calculate the content of $\text{C}_{20}\text{H}_{18}\text{ClO}_4 \cdot 2\text{H}_2\text{O}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Berberine hydrochloride.

Strength 0.1 g

Storage Preserve in tightly closed container and protected from light.

Berberine Hydrochloride Tablets

Berberine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% the labelled amount of berberine hydrochloride ($\text{C}_{20}\text{H}_{18}\text{ClNO}_4 \cdot 2\text{H}_2\text{O}$).

Description A yellow sugar-coated or film-coated tablet with yellow core.

Identification To a quantity of powdered tablets (equivalent to about 0.1 g of berberine hydrochloride) add 10 ml of water, heat gently to dissolve, filter. The filtrate complies with the tests (1), (2), (3), (5) for Identification described under Berberine Hydrochloride.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium, adjust the rotational speed of the basket to 120 rpm, withdraw 5 ml of the solution after exactly 45 minutes and filter. Dilute 2 ml of the successive filtrate, to a 25 ml volumetric flask, dilute with water to volume, mix well. Measure the absorbance at 263 nm (Appendix IV A) and calculate the dissolution of $\text{C}_{20}\text{H}_{18}\text{ClNO}_4 \cdot 2\text{H}_2\text{O}$ from each tablet, taking 724 as the value of A (1%, 1 cm). Not Less than 70% of the Labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer [0.05 mol/L potassium dihydrophosphate mixed with 0.05 mol/L heptane sodium sulfonate (1:1) containing 0.2% triethylamine, adjust to pH 3.0 with phosphoric acid,]-acetonitrile (60:40) as the mobile phase. Detective Wavelength is 263 nm, and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of berberine hydrochloride. The resolution factor between the peaks of berberine hydrochloride and adjacent peak should agree with the requirement.

Procedure Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powder equivalent to about 40 mg of berberine hydrochloride in a quantity of boiling water in 100 ml volumetric flask, and cool to room-temperature, then dilute with water to volume, mix well, filter by filter membrane (0.45 μm), discard about 8 ml of the initial filtrate, then accurately measure 5 ml of successive filtrate in a 50 ml volumetric flask and dilute with water to volume, mix well, inject 20 μl into the column and record the chromatogram. Dissolve an accurately weighed quantity of berberine hydrochloride CRS in boiling water and dilute to produce a solution of about 40 μg per ml, calculate the content of $\text{C}_{20}\text{H}_{18}\text{ClO}_4 \cdot 2\text{H}_2\text{O}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Berberine Hydrochloride.

Strength (1) 0.025 g (2) 0.05 g (3) 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Betahistine Hydrochloride

$\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{HCl}$ 209.12

[5579-84-0]

Betahistine Hydrochloride is *N*-methyl-2-pyridineethanamine dihydrochloride. It contains not less than 98.0% of $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{HCl}$, calculated on the dried basis.

Description White or almost white crystals or crystalline powder; odourless; taste, slightly bitter; hygroscopic. Freely soluble in water; slightly soluble in ethanol; practically insoluble in acetone.

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of betahistine hydrochloride (Appendix XVI).

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and chloroform-methanol-strong ammonia solution (40:10:1) as the mobile phase. Apply separately to the plate 10 μl of each of two solutions in methanol containing (1) 20 mg per ml and (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine in iodine vapour. Any spot, other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Clarity of solution A solution of 0.1 g in 10 ml of water is clear.

Acidity Dissolve 0.1 g in 10 ml of water, pH 2.0-3.0 (Appendix VI H).

Loss on drying When dried over phosphorous pentoxide to constant weight at 100°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 10.46 mg of $\text{C}_8\text{H}_{12}\text{N}_2 \cdot 2\text{HCl}$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation Betahistine Hydrochloride Tablets

Betahistine Hydrochloride Tablets

Betahistine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of betahistine hydrochloride ($C_8H_{12}N_2 \cdot 2HCl$).

Description Sugar coated tablets with white or almost white core.

Identification (1) To a quantity of the powdered tablets equivalent to about 10 mg of betahistine hydrochloride add 1 drop of sodium nitroprusside TS and 2 drops of 5% sodium carbonate solution, mix well, dip a strip of filter paper in the mixture. To another test tube add about 0.5 g of potassium hydrogen sulfate and 1-2 drops of glycerin, place the filter paper prepared above on top of the test tube and heat the mixture cautiously, the filter paper turns to blue. Remove the filter paper and add a few drops of 2% sodium hydroxide solution, the colour of the filter paper changes to red.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 261 nm (Appendix IV A).

(3) To a quantity of the powdered tablets add water to dissolve betahistine hydrochloride, filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

Content uniformity Comply with the requirements (Appendix X E). Shake thoroughly 1 tablet with coating removed in a 50 ml (for strength 4 mg and 5 mg) or 100 ml (for strength 10 mg) volumetric flask with a quantity of hydrochloric acid solution (9 → 1000), dilute to volume, mix well and filter. Measure accurately 20 ml of the successive filtrate and proceed as described under Assay, beginning at the words "to a 100 ml volumetric flask...", calculate the content of $C_8H_{12}N_2 \cdot 2HCl$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. Shake thoroughly an accurately weighed quantity of the powder, equivalent to about 15 mg of betahistine hydrochloride in a 50 ml volumetric flask, with a quantity of hydrochloric acid solution (9 → 1000), dilute to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 261 nm (Appendix IV A), calculate the content of $C_8H_{12}N_2 \cdot 2HCl$, taking 352 as the value of A (1%, 1 cm).

Category As described under Betahistine Hydrochloride.

Strength (1) 4 mg (2) 5 mg (3) 10 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Betamethasone

$C_{22}H_{29}FO_5$ 392.47

[378-44-9]

Betamethasone is 16β-methyl-11β, 17α, 21-trihydroxy-9α-fluoro-pregna-1,4-diene-3,20-dione. It contains not less than 97.0% and not more than 103.0% of $C_{22}H_{29}FO_5$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Sparingly soluble in ethanol or dioxane; slightly soluble in chloroform; practically insoluble in water.

Melting range 236-244°C, with decomposition (Appendix VI C).

Specific optical rotation +115° to +121°, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μg per ml in ethanol at 239 nm (Appendix IV A), the value of A (1%, 1 cm) is 382-406.

Identification (1) Dissolve about 10 mg in 1 ml of methanol by warming, add 1 ml of hot alkaline cupric tartrate TS; a brick-red precipitate is produced.

(2) The retention time of principal peak of betamethasone in the substance being examined in the chromatogram obtained in the Assay is identical with that of betamethasone CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of betamethasone (Appendix XVI).

(4) It yields the reactions characteristic of organic fluorine compounds (Appendix III).

Related substances Dissolve a quantity of the substance being examined in mobile phase and dilute with the same solvent to produce a solution of 0.4 mg per ml, and use this solution as a test solution. Transfer 1 ml, accurately measured, into 100 ml volumetric flask, dilute to volume with mobile phase, mix well, as a reference solution. Carry out the method as described under Assay. Inject 20 μl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 40% of full scale of the chart. Inject separately 20 μl each of the two solutions into the column, and record the chromatogram for twice the retention time of the principal peak. The largest area of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution, each area of such peaks is not greater than 1/2 area of the principal peak in the chromatogram obtained with reference solution, the sum of the areas of such peaks in the chromatogram obtained with test solution is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (56 : 44) as the mobile phase. Detective Wavelength is 240 nm. Dissolve a quantity of methylprednisolone CRS in the solution of substance being examined to produce a solution of betamethasone and methylprednisolone each 40 μg per ml, inject 20 μl into the column. The resolution factor between the peaks of betamethasone and methylprednisolone is not less than 2.2.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in the mobile phase to produce a solution of about 40 μg per ml, inject 20 μl into

the column and record the chromatogram. Repeat the operation, using betamethasone CRS instead of the substance being examined. Calculate the content of $C_{22}H_{29}FO_5$ With respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Betamethasone Cream
(2) Betamethasone Tablets

Betamethasone Cream

Betamethasone cream contains not less than 90.0% and not more than 110.0% of the labelled amount of betamethasone ($C_{22}H_{29}FO_5$).

Description A white cream.

Identification The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of betamethasone CRS.

Other requirements Complies with the general requirements of cream (Appendix I F).

Assay Dissolve a quantity of the substance being examined, equivalent to about 1 mg of betamethasone, accurately weighed, in 50 ml methanol and mix 30 seconds at 9500 rpm by homogenizer after that filter by organic filter membrane (0.45 μ m), discard 5 ml of the initial filtrate, take the successive filtrate as the solution of substance being examined. Dissolve a quantity of betamethasone CRS, accurately weighed, in the mobile phase to make the reference solution of 20 μ g per ml. Carry out the method as described under the Assay of Betamethasone and calculate the content of $C_{22}H_{29}FO_5$.

Category As described under Betamethasone.

Strength (1) 4 g : 4 mg (2) 10 g : 10 mg
(3) 15 g : 15 mg

Storage Preserve in tightly closed containers, stored in cool place.

Betamethasone Tablets

Betamethasone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of betamethasone ($C_{22}H_{29}FO_5$).

Description White tablets.

Identification (1) To a quantity of powdered tablets equivalent to 2 mg of betamethasone add 5 ml of methanol, heat gently and shake thoroughly until betamethasone is dissolved. Filter, add 0.5 ml of sulfuric acid to 1 ml of the filtrate and mix well. Allow to stand for about 5 minutes; an intense reddish-orange colour is produced.

(2) The retention time of principal peak in the chromatogram of the substance being examined obtained in the Assay is identical with that of betamethasone CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exactly 45 minutes and filter,

take the successive filtrate as the test solution. Dissolve 21 mg of betamethasone CRS with methanol in a 100 ml volumetric flask, dilute with water to volume, mix well. Measure accurately 2 ml of the solution in a 1000 ml volumetric flask, dilute with water to volume, mix well as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (60 : 40) as the mobile phase. Detective Wavelength is 240 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of betamethasone. Inject 100 μ l of the reference solution into the column, adjust the RSD of the principal peak area between the continuous six injections is not larger than 3.0%. Then separately inject 100 μ l of the test solution and reference solution into the column, record the chromatogram, calculate the dissolution of $C_{22}H_{29}FO_5$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Content uniformity Comply with the requirement (Appendix X E). Put 1 tablet into a 25 ml volumetric flask, add a quantity of mobile phase and ultrasonic for 30 minutes to dissolve betamethasone, then cool to room temperature, dilute to the volume with mobile phase, mix well, centrifugate for 20 minutes at 4000 rpm, take the supernate as the test solution. Dissolve a quantity of betamethasone CRS, accurately weighed, in the mobile phase to produce a solution of about 20 μ g as the reference solution. Carry out the method described under the Assay, calculate the content of $C_{22}H_{29}FO_5$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder equivalent to about 1 mg of betamethasone into a 50 ml volumetric flask, add a quantity of mobile phase, ultrasonic for 30 minutes until betamethasone is dissolved. Cool to room temperature, dilute with mobile phase to volume, mix well and centrifugate for 20 minutes at 4000 rpm, take the supernate as the test solution. Carry out the method described under the Assay of Betamethasone, calculate the content of $C_{22}H_{29}FO_5$.

Category As described under Betamethasone.

Strength 0.5 mg

Storage Preserve in tightly closed containers, protected from light.

Betamethasone Sodium Phosphate

$C_{22}H_{28}FN_2O_8P$ 516.41

[151-73-5]

Betamethasone Sodium Phosphate is disodium 16 β -methyl-11 β ,17 α , 21-trihydroxy-9 α -fluoro-pregna-1,4-diene-3,20-dione-21-diphosphate. It contains not less than 96.0% and not more than 103.0% of $C_{22}H_{28}FN_2O_8P$, calculated on the dried basis.

Description A white or almost powder; odourless or almost odourless; hygroscopic. Freely soluble in water; practically insoluble in acetone and chloroform.

Specific optical rotation $+95^{\circ}$ to $+102^{\circ}$, in a 1% aqueous solution (Appendix VI E).

Identification (1) Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a solution of *n*-butanol saturated with dilute hydrochloric acid as the mobile phase. Apply separately to the plate 10 μ l each of solution containing (1) 1 mg of betamethasone sodium phosphate CRS per ml and (2) 1 mg of the substance being examined per ml. After developing and removal of the plate, dry it in air, spray with a mixture of sulfuric acid-methanol-nitric acid (10:10:1), and heat for 10 minutes at 105°C . The position of principal spot in the chromatogram obtained with the solution (2) correspond to that in the chromatogram obtained with the solution (1).

(2) Dry it for 3 hours at 105°C . The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of betamethasone sodium phosphate (Appendix XI).

(3) Heat gently 40 mg with 2 ml of sulfuric acid until the sulfuric acid fumes are expelled, add nitric acid dropwise and heat until the nitrous oxide fumes is evolved and removed, ignite at 500°C and cool. To the residue add 5 ml, neutralized to litmus paper when necessary, and filter. The filtrate yields the reactions characteristic of sodium salts and phosphates (Appendix III).

Alkalinity Dissolve 5 mg in 1 ml of water, pH 7.0-9.0 (Appendix VI H).

Free phosphate Weigh accurately 20 mg, carry out the test as described under Dexamethasone Sodium Phosphate. The absorbance of the test preparation is not more than that of the reference preparation.

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of potassium dihydrophosphate hexylamine solution (mix 1.36 g of potassium dihydrophosphate with 0.60 g of hexylamine, stand for 10 minutes, then dissolve it in 185 ml of water)-acetonitrile (74:26) as the mobile phase. Detective Wavelength is 254 nm. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce the test solution (1) of about 2.5 mg per ml. Measure accurately 1 ml the test solution into a 50 ml volumetric flask and dilute to volume by mobile phase, mix well as the reference solution (2). Dissolve a quantity of betamethasone sodium phosphate and dexamethasone sodium phosphate in mobile phase to make a solution (3) of each 40 μg per ml. Inject 20 μl of the solution (3) into the column. The resolution factor between the peaks of betamethasone sodium phosphate and dexamethasone sodium phosphate is not less than 2.0 and that between the peaks of betamethasone sodium phosphate and adjacent peak should comply with the requirement. Inject 20 μl of the solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 70%-90% of full scale of the chart. Inject separately accurately 20 μl each of the solution (1) and (2) into the column, and record the chromatogram for three times the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) is not greater than the area of the principal peak and 1.5 time the area of the principal peak obtained with solution (2) respectively. Among such peaks. There is not more than one peak whose area is

greater than 1/2 time the area of the principal peak obtained with solution (2).

Loss on drying When dried in vacuum to constant weight at 100°C for 4 hours, loses not more than 8.0% of its weight (Appendix VIII L).

Assay Reference preparation Dissolve accurately a quantity of betamethasone sodium phosphate CRS, equivalent to 20 mg of betamethasone, in methanol to produce a solution of 0.4 mg per ml.

Test preparation To a quantity of the substance being examined, equivalent to 20 mg of betamethasone, in methanol in a 50 ml volumetric flask add methanol to volume and shake thoroughly (filter if necessary).

Procedure To 1 ml of each of two preparations, accurately measured, in separate 25 ml volumetric flasks add accurately 20 ml of a solution of isoniazid (dissolve 75 mg of isoniazid and 0.1 ml of hydrochloric acid in methanol to make up to 100 ml), and mix well. Heat on 60°C water bath for 1 hour and cool. Dilute with methanol to volume, mix well, and measure the absorbance at 420 nm (Appendix IV B). Calculate the content of $\text{C}_{22}\text{H}_{28}\text{FN}_2\text{O}_5\text{P}$.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation Betamethasone Sodium Phosphate Injection

Betamethasone Sodium Phosphate Injection

Betamethasone Sodium Phosphate Injection is a sterile solution of Betamethasone Sodium Phosphate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of betamethasone ($\text{C}_{22}\text{H}_{28}\text{FO}_5$). Suitable amount of stabilizer may be added.

Description A clear, colourless liquid.

Specific optical rotation $+88^{\circ}$ to $+108^{\circ}$, in a solution of the substance being examined (Appendix VI E).

Identification Evaporate an amount of the injection on a water bath to dryness, use the residue for the following tests: (1) Dissolve 2 mg in 2 ml of sulfuric acid TS; a yellow colour is produced, changing to brownish red on standing for a moment.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of betamethasone sodium phosphate CRS.

(3) It yields the reactions characteristic of organic fluorine compounds (Appendix III).

pH value 7.0-9.0 (Appendix VI H).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrophosphate solution-methanol (1:1) as the mobile phase. Detective Wavelength is 254 nm, and the number of theoretical plates of the column is not less than 2000. The resolution factor between the peaks of betamethasone sodium phosphate and internal standard should agree with the requirement.

Internal standard solution Dissolve a quantity of ethyl *p*-hydroxybenzoate in methanol to produce a solution of 0.1 mg per ml.

procedure Transfer 2 ml, accurately measured, to a 50 ml volumetric flask, dilute with water to the volume, mix well, then accurately measure 5 ml to a 25 ml volumetric flask, add accurately 5 ml internal standard solution, dilute with water to the volume, mix well. Inject 20 μ l into the volume and record the chromatogram. Dissolve a quantity of betamethasone sodium phosphate CRS, accurately weighed in water to produce a solution of about 0.21 mg per ml. Measure accurately the reference solution and internal standard solution each of 5 ml into a 25 ml volumetric flask, dilute with water to volume, mix well, repeat the operation above, calculate the content of $C_{22}H_{28}FN_2O_8P$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Bethamason Sodium Phosphate.

Strength 1 ml : 5.26 mg (equivalent to 4 mg of Betamethasone)

Storage Preserve in well closed containers, protected from light.

Bifendate

$C_{20}H_{18}O_{10}$ 418.36

Bifendate is 4,4'-dimethoxy-5,6,5',6'-dimethylenedioxy-2,2'-di (methyl-formate) diphenyl. It contains not less than 97.0% and not more than 103.0% of $C_{20}H_{18}O_{10}$, calculated on the dried basis.

Description A white crystalline powder; odourless; tasteless. Freely soluble in chloroform; practically insoluble in ethanol or water.

Melting point 180-183°C, insert the capillary tube into the bath at 150°C (Appendix VI C).

Identification (1) To about 20 mg add 6 drops of hydroxylamine hydrochloride TS, alkalinize the solution with saturated ethanolic potassium hydroxide solution dropwise, boil gently for a moment, cool, acidify the solution with dilute hydrochloric acid, add 1 drop of ferric chloride TS, a dark violet colour is produced.

(2) To about 5 mg add 1 ml of chromotropic acid TS, shake thoroughly, heat in the water bath for a moment, a violet colour is produced.

(3) The light absorption of the solution obtained in Assay exhibits a maximum at 278 nm and a minimum at 260 nm.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bifendate (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of petroleum ether (30-60°C)-ethyl acetate-chloroform (65:20:15) as the mobile phase. Apply separately to the plate 10 μ l each of two

solutions of the substance being examined, in chloroform containing (1) 10 mg per ml and (2) 0.1 mg per ml. After developing and removal of the plate, dry it in air and spray with 50% sulfuric acid solution in dehydrated ethanol, heat at 110°C for 30 minutes. The principal spot should be revealed clearly in the chromatogram obtained with solution (2), and any spot, other than the principal spot in the chromatogram obtained with solution (1) is not revealed.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H), using the residue obtained in the test for Residue on ignition: not more than 0.002%.

Assay Weigh accurately about 15 mg in a 100 ml volumetric flask, add 80 ml of ethanol, heat to dissolve bifendate in a water bath, cool, dilute with ethanol to volume and mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 278 nm (Appendix IV A). Repeat the procedure using about 15 mg of bifendate CRS instead of the substance being examined. Calculate the content of $C_{20}H_{18}O_{10}$.

Category Anti-hepatitis.

Storage Preserve in tightly closed containers, protected from light.

Preparation Bifendate Pills

Bifendate Pills

Bifendate Pills contain not less than 90.0% and not more than 110.0% of the labelled amount of bifendate ($C_{20}H_{18}O_{10}$).

Description Sugar coated dripping pills.

Identification To 15 pills add 5 ml of water, shake to dissolve the excipient, centrifuge for 10 minutes, discard supernatant, then add 5 ml of water, centrifuge for 10 minutes, discard supernatant. The sediment complies with the tests (1), (2) and (3) for Identification described under Bifendate.

Content uniformity Comply with the requirements (Appendix X E). Shake to dissolve 10 pills individually with 1 ml of water in 25 ml ground-glass stoppered test tube, add accurately 10 ml of chloroform, shake for 5 minutes, allow to stand until the extract separate into two layers. Discard the upper water layer, add 1 g of anhydrous, sodium sulfate shake for 1 minute, allow to stand until the chloroform layer becomes clear. Measure accurately 5 ml of the chloroform solution to a small beaker, evaporate to dryness on a water bath, add 10 ml of ethanol to dissolve the residue by heating on a water bath, cool and transfer it to a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Prepare a blank solution in the same manner. Measure the absorbances of the solutions at 278 nm (Appendix IV A), calculate the content of $C_{20}H_{18}O_{10}$, taking 363 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for pills (Appendix I H).

Assay Weigh accurately and triturate 20 pills. To a quantity, accurately weighed, equivalent to about 3 mg of bifendate in a 25 ml ground-glass stoppered test tube add 1

ml of water, shake for 2 minutes, then add accurately 20 ml of chloroform, shake for 5 minutes, allow to stand until the extract separate into two layers. Discard the upper water layer, add 1 g of anhydrous, sodium sulfate, shake for 1 minute, allow to stand until the chloroform layer becomes clear. Measure accurately 5 ml of the chloroform solution in a small beaker, evaporate to dryness on a water bath. Add 10 ml of ethanol to dissolve the residue by heating on a water bath cool and transfer it to a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Prepare a blank solution in the same manner with 20 ml of chloroform. Measure the absorbance of the solutions at 278 nm (Appendix IV A), calculate the content of $C_{20}H_{18}O_{10}$, taking 363 as the value of A (1%, 1 cm).

Category As described under Bifendate.

Strength 1.5 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Bifonazole

$C_{22}H_{18}N_2$ 310.40

Bifonazole is (\pm) 1-(α -biphenyl-4-benzyl)-1H-imidazole. It contains not less than 99.0% of $C_{22}H_{18}N_2$, calculated on the dried basis.

Description An almost white to slightly yellow crystalline powder; odourless; tasteless. Freely soluble in chloroform; sparingly soluble in methanol or dehydrated ethanol; practically insoluble in water.

Melting range 148-153°C (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 2 ml of chloroform in a test tube, add a small quantity of anhydroalcohol along the wall, a purplish red or purple is produced.

(2) To about 10 mg add 10 drops of citric-acetic anhydride TS, and mix, a yellow to purple is developed on warming.

(3) The light absorption of a solution of 10 μ g per ml in methanol exhibits a maximum at 254 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bifonazole (Appendix XVI).

Bifonol Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-tetrahydrofuran (84 : 15 : 1) as the mobile phase. Detection wavelength is 254 nm, and the number of theoretical plates of the column is not less than 700, calculated with reference to the peak of bifonazole. Dissolve a quantity in mobile phase to produce a solution containing 1.0 mg of the substance being examined per ml as solution (1). Dissolve a quantity of the bifonol CRS in mobile phase to produce a solution of 5 μ g per ml as solution (2). Dissolve a quantity of bifonazole CRS and bifonol CRS in mobile phase to produce solution (3) containing 1.0 mg of bifonazole CRS and 5 μ g of bifonol CRS per ml. Inject 10 μ l

of solution (3) into the column, adjust the attenuator of the detector, so that the peak height of bifonol in the chromatogram is about 10% of full scale of the chart and the resolution factor between the peaks of bifonazole and bifonol complies with related requirements. Inject separately 10 μ l of solution (1) and solution (2) into the column and record the chromatogram. The peak area of bifonol obtained from solution (1) is not greater than that obtained from solution (2) (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Assay Dissolve about 0.25 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.04 mg of $C_{22}H_{18}N_2$.

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Bifonazole Cream
(2) Bifonazole Solution
(3) Bifonazole Suppositories

Bifonazole Cream

Bifonazole Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of bifonazole ($C_{22}H_{18}N_2$).

Description A white to slight yellow cream.

Identification The retention time of principal peak of bifonazole in the substance being examined in the chromatogram obtained in the Assay is identical with that of bifonazole CRS.

Other requirement Complies with the general requirement for cream (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-tetrahydrofuran (84 : 15 : 1) as the mobile phase. The detection wavelength is 254 nm. The number of theoretical plates of the column is not less than 700, calculated with reference to the peak of bifonazole.

Procedure To an accurately weighed quantity equivalent to 5 mg of bifonazole in a 100 ml volumetric flask add a quantity of methanol, shake thoroughly to disperse well and dissolve bifonazole. Dilute with methanol to volume, mix well and cool in an ice bath over 2 hours. Filter immediately and cool successive filtrate to room temperature as the test solution. Dissolve an accurately weighed quantity of bifonazole CRS in methanol and dilute to produce a solution of 0.05 mg per ml as the reference solution. Inject separately 10 μ l of the test solution and the reference solution into the column. Calculate the content of $C_{22}H_{18}N_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Bifonazole.

Strength 15 g : 150 mg

Storage Preserve in tightly closed containers, stored in a

cool place.

Bifonazole Solution

Bifonazole Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of bifonazole ($C_{22}H_{18}N_2$).

Description A clear, colourless liquid; odour, characteristic of ethanol; readily volatile.

Identification The retention time of principal peak of bifonazole in the substance being examined in the chromatogram obtained in the Assay is identical with that of bifonazole CRS.

Fill Complies with the general requirement of test for minimum fill (Appendix X F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-tetrahydrofuran (84:15:1) as the mobile phase. The detection wavelength is 254 nm. The number of theoretical plates of the column is not less than 700, calculated with reference to the peak of bifonazole.

Procedure Measure accurately 5 ml to a 100 ml volumetric flask, dilute with methanol to volume and mix well. Transfer accurately 1 ml of the solution into a 10 ml volumetric flask, dilute with methanol to volume and mix well as a test solution. Dissolve a quantity of bifonazole CRS, accurately weighed, in mobile phase and dilute to produce a solution of 0.05 mg per ml as a reference solution. Inject separately 10 μ l of the test solution and the reference solution into the column. Calculate the content of $C_{22}H_{18}N_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Bifonazole.

Strength 10 ml:100 mg

Storage Preserve in tightly closed containers, stored in a cool place.

Bifonazole Suppositories

Bifonazole suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of bifonazole ($C_{22}H_{18}N_2$).

Description Creamy white or pale yellow suppositories.

Identification To 2 suppositories add 10 ml of petroleum ether, warm gently on a water bath until dissolved. Allow to cool, discard the petroleum ether, wash the residue with a small quantity of petroleum ether twice, discard the washings, heat on a water bath to expel petroleum ether. Dissolve the residue in chloroform to produce a solution of 2 mg per ml as test solution. Dissolve a quantity of bifonazole CRS in chloroform to produce a solution of 2 mg per ml as reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropyl ether (saturated with ammonia vapour) as the mobile phase. Apply separately to the plate 10 μ l each of the above two solutions, after developing and removal of the plate, dry it in air, expose to iodine vapour. The colour and position of the principal spot in the chromatogram obtained with the test

solution correspond to the principal spot obtained with reference solution.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Weigh accurately 10 suppositories, melt together in an evaporating dish on a water bath and allow to cool, stirring continuously until well mixed. Dissolve a quantity equivalent to 50 mg of bifonazole, accurately weighed, in a conical flask with a stopper, in 30 ml of chloroform. Add 15 ml of water and 5 ml of dilute sulfuric acid TS, add 0.6 ml of dimethyl yellow-solvent blue 19 IS, titrate with dioctyl sodium sulfosuccinate TS. Towards the end of titration shake vigorously and continue the titration until chloroform layer changes from green to reddish grey. Repeat the operation, using 50 mg of bifonazole CRS, accurately measured, instead of the substance being examined. Calculate the content of $C_{22}H_{18}N_2$ from the volume ratio of dioctyl sodium sulfosuccinate TS consumed in the titrations.

Category As described under bifonazole.

Strength 0.15 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Bisacodyl

$C_{22}H_{19}NO_4$ 361.40

[603-50-9]

Bisacodyl is 4,4'-(2-Pyridylmethylene) diphenyl diacetate. It contains not less than 98.0% of $C_{22}H_{19}NO_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Freely soluble in chloroform; soluble in acetone; slightly soluble in ethanol or ether; insoluble in water.

Melting range 132-136°C (Appendix VI C).

Identification (1) The light absorption of a solution of 10 μ g per ml in 0.1 mol/L methanolic potassium hydroxide solution exhibits a maximum at 248 nm, the absorbance is 0.62-0.68 (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bisacodyl (Appendix XVI).

Acidity or alkalinity To 1.0 g add 20 ml of water, heat to boil, allow to cool and filter, the pH value of the filtrate is 5.0-7.5 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of xylene-butanone (1:1) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions of the substance being examined in acetone containing (1) 20 mg per ml and (2) 0.20 mg per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.3 g, accurately weighed, in 25 ml of glacial acetic acid, add 2 drops of naphtholbenzein IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellowish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 36.14 mg of $C_{22}H_{19}NO_4$.

Category Cathartic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Bisacodyl Enteric-coated Tablets
(2) Bisacodyl Suppositories

Bisacodyl Enteric-coated Tablets

Bisacodyl Tablets contain not more than 93.0% and not more than 107.0% of the labelled amount bisacodyl ($C_{22}H_{19}NO_4$).

Description Enteric coated tablets with white cores.

Identification (1) Dissolve quantity of powdered tablets equivalent to about 50 mg of bisacodyl in 30 ml of chloroform with shaking. Filter and evaporate the filtrate to dryness, add 10 ml of 1% sulfuric acid solution to dissolve the residue, the solution complies with following tests.

To 2 ml add 1 drop of mercuric potassium iodide TS, a white precipitate is produced.

To 2 ml add dropwise sulfuric acid, a purple colour is produced.

To 2 ml add 1-2 drops of nitric acid, heat, a yellow colour is produced, cool and add sodium hydroxide TS dropwise, the colour changes to yellowish brown.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of xylene-butanone (1:1) as the mobile phase. To a quantity of powdered tablets equivalent to 20 mg of bisacodyl add 2 ml of acetone, shake for 10 minutes and centrifuge, use the supernate as the test solution. Prepare reference solution of 10 mg bisacodyl CRS per ml in acetone. Apply separately to the plate 2 µl each of the two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). The position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained with the reference solution.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of xylene-butanone (1:1) as the mobile phase. To a quantity of powdered tablets equivalent to 20 mg of bisacodyl add 2 ml of acetone, shake for 10 minutes and centrifuge, use the supernate as the test solution. Measure accurately 0.3 ml of the test solution, dilute with acetone to 10 ml as the reference solution. Apply separately to the plate 10 µl each of the two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with test solution is not intense than the principal spot obtained with the reference solution.

Content uniformity Comply with the requirements

(Appendix X E). Triturate 1 enteric coated stripped tablet with a quantity of chloroform, and transfer to a 25 ml volumetric flask with chloroform in portions, shake to dissolve bisacodyl, dilute with chloroform to volume and mix well. Filter, measure accurately 5 ml of successive filtrate to another 25 ml volumetric flask, dilute to volume, mix well. Carry out the method described under Assay. Calculate the content of $C_{22}H_{19}NO_4$ in each tablet.

Other requirements Comply with the general requirements of tablets (Appendix I A).

Assay Weigh accurately and powder 20 enteric coat stripped tablets. Dissolve a quantity of the powder equivalent to about 20 mg of bisacodyl, accurately weighed, in a quantity of chloroform in a 50 ml volumetric flask, dilute with chloroform to volume, mix well, filter, measure accurately 5 ml of the successive filtrate to another 50 ml volumetric flask, dilute to volume and mix well. Measure the absorbance at 264 nm (Appendix IV A), calculate the content of $C_{22}H_{19}NO_4$, taking 148 as the value of A (1%, 1 cm).

Category As described under Bisacodyl.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Bisacodyl Suppositories

Bisacodyl Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of bisacodyl ($C_{22}H_{19}NO_4$).

Description White suppositories.

Identification (1) To 1 suppository add 3 ml of 1% sulfuric acid solution, heat to melt, add 4-5 drops of nitric acid dropwise and heat; a yellow colour is produced, add 10 drops of 20% sodium hydroxide solution, the colour changes to brownish-red.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of xylene-butanone (1:1) as the mobile phase. To 1 suppository add 20 ml of water, stir to mix well and filter, wash the residue with a little quantity of water, allow to dry, dry in a vacuum desiccator over phosphorus pentoxide for 2 hours, dissolve the residue in 2 ml of acetone as the test solution. Prepare reference solution of 5 mg bisacodyl CRS per ml in acetone. Apply separately to the plate 10 µl of each of the two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(3) The light absorption of the test solution obtained in Assay exhibits a maximum at 264 nm (Appendix IV A).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Dissolve 1 suppository in a quantity of 1 mol/L hydrochloric acid solution in a 100 ml volumetric flask, dilute with 1 mol/L hydrochloric acid solution to volume, mix well, measure accurately 10 ml to a 50 ml volumetric flask, dilute to volume with the same solvent, mix well. Carry out the procedure described under Assay. Calculate the content of $C_{22}H_{19}NO_4$.

Other requirements Comply with the general requirements of suppositories (Appendix I D).

Assay Place 10 suppositories in an evaporating dish, heat to melt on a water bath, cool, stir to mix well. Dissolve a quantity equivalent to about 20 mg of bisacodyl, accurately weighed, in a quantity of 1 mol/L hydrochloric acid solution in a 100 ml volumetric flask, dilute to volume with 1 mol/L hydrochloric acid solution, mix well, measure accurately 10 ml to another 100 ml volumetric flask, dilute to volume with the same solvent and mix well, measure the absorbance at 264 nm (Appendix IV A). Repeat the operation, using the reference solution of 20 µg bisacodyl CRS per ml in 1 mol/L hydrochloric acid solution instead of the test solution, calculate the content of $C_{22}H_{19}NO_4$.

Category As described under Bisacodyl.

Strength 10 mg

Storage Preserve in tightly closed containers, stored at a temperature below 30°C.

Bismuth Aluminate

$Bi_2 (Al_2O_4)_3 \cdot 10H_2O$ 951.99

Bismuth Aluminate contains not less than 51% and not more than 55% of bismuth (Bi); contains not less than 19.5% and not more than 21.5% of aluminium (Al), calculated with reference to the substance ignited to constant weight.

Description A white or almost white powder; odourless; tasteless.

Insoluble in water or ethanol.

Identification (1) Dissolve about 50 mg in 1 ml of nitric acid by heating, cool, add 10 ml of water. To 2 ml of the resulting solution add dropwise potassium iodide TS, a brownish black precipitate is produced, it dissolves in an excess of potassium iodide TS to produce an orange yellow solution.

(2) To about 0.2 g add 10 ml of dilute hydrochloric acid, heat, cool and filter. To 5 ml of the filtrate add ammonia TS dropwise until a white precipitate is produced, add a few drops of sodium alizarin sulfonate TS, the precipitate becomes cherry red in colour.

Chlorides Dissolve 0.20 g add 4 ml of nitric acid by heating gently to boiling, cool, add water to produce 20 ml and mix well. Carry out the limit test for chlorides (Appendix VIII A), using 5 ml of the resulting solution. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.14%).

Sulfates Dissolve 1.0 g in 4 ml of nitric acid by heating, cool, add 30 ml of water, the white precipitate is produced. Add dropwise ammonia TS to neutralize the solution and dilute with water to produce 50 ml, mix well and filter. Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.02%).

Nitrate Dissolve 50 mg in about 40 ml of sulfuric acid solution (1→2) by heating, dilute to 50 ml and mix well. To 1.0 ml add 4.0 ml of water and 0.5 ml of 10% sodium chloride solution and mix well. Add 1 ml of dilute indigocarmine solution [mix indigo-carmin TS with equal volume of water. Before using, dilute 1 ml of this solution, accurately measured, to 50 ml with water. Measure the absorbance of the resulting solution at 610 nm (Appendix IV B), the absorbance is 0.30-0.40], accurately measured,

mix well. Add alongside the wall 4.5 ml of sulfuric acid slowly, shake gently for 1 minute, allow to stand for 10 minutes. Any colour produced is not more intense than that of a reference solution using 0.50 ml of potassium nitrate standard solution (dissolve 81.5 mg of potassium nitrate, previously ignited to constant weight at 105°C and accurately weighed in a 50 ml volumetric flask with water and dilute to volume. Measure accurately 5 ml and dilute to 100 ml with water. Each ml of this solution is equivalent to 50 µg of NO_3 .) (2.5%).

Barium Dissolve 0.4 g in 4 ml of nitric acid by heating, cool, add 20 ml of water. Divide this solution into two equal portions. To one portion add 1 ml of dilute sulfuric acid, and to the other portion add 1 ml of water, allow to stand for 15 minutes, the solutions should be equally clear.

Lead, silver and copper To 3.0 g add 6 ml of nitric acid, heat gently to boiling for 2 minutes, cool. Add 100 ml of water, stir, filter. Evaporate the filtrate to about 30 ml on a water bath, cool, filter, add water to produce 30 ml. Mix 5 ml of this solution with an equal volume of dilute sulfuric acid; no turbidity is produced. To 5 ml of this solution add hydrochloric acid; no precipitate is produced that is insoluble in an excess of hydrochloric acid but soluble in ammonia TS. To 5 ml of this solution add a slight excess of ammonia TS; the supernatant liquid does not exhibit blue.

Arsenic To 1.0 g add 10 ml of dilute sulfuric acid, heat to boiling, cool, add 5 ml of hydrochloric acid and a quantity of water to produce 28 ml. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Loss on ignition When ignited to constant weight at 700°C, loses not more than 22.0% of its weight.

Assay Bismuth To about 0.2 g, accurately weighed, in a 500 ml conical flask add 15 ml of nitric acid solution (3→10), place a funnel on the conical flask, heat gently until dissolved completely, cool. Add 200 ml of water, ammonia TS dropwise to adjust the solution to about pH 1, and 5 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS until the colour changes to yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Aluminum To the solution retained in the Assay for Bi add ammonia TS dropwise until a precipitate is just formed and redissolve it by adding dropwise dilute nitric acid (pH is about 6). Add 10 ml of acetic acid-ammonia acetate BS (pH 6.0) and 30 ml of disodium edetate, accurately measured, boil for 5 minutes. Cool to room temperature, add 10 drops of xylenol orange IS, titrate with zinc (0.05 mol/L) VS until the colour changes from yellow to red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Category Antacid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Compound Bismuth Aluminate Capsules
(2) Compound Bismuth Aluminate Tablets

Compound Bismuth Aluminate Tablets

Compound Bismuth Aluminate Tablets contain not less than 79 mg and not more than 97 mg of

bismuth (Bi); not less than 30.6 mg and not more than 37.4 mg of aluminium (Al); not less than 37.3% and not more than 45.7% of the labelled amount of heavy magnesium carbonate calculated as magnesium oxide (MgO) in each tablet.

Formula	Bismuth Aluminate	200 g
	Heavy Magnesium Carbonate	400 g
	Sodium Bicarbonate	200 g
	Liquorice Extract	300 g
	Rhamnus Frangula	25 g
	Fennel Powder	10 g
	Excipient	sufficient
	To make	1000 tablets

Description Pale yellow to yellowish brown tablets.

Identification Heat gently about 1 g of the powdered tablets in a crucible, until it is thoroughly charred, cool, add 3 ml of nitric acid. Heat gently until nitric acid fume is no longer evolved, ignite until the incineration is complete. The residue complies with the following tests:

(1) Dissolve a quantity of the residue in 5 ml of dilute nitric acid, filter, to the filtrate add potassium iodide TS dropwise, a brownish-red precipitate is produced which is dissolved in an excess of potassium iodide TS.

(2) Dissolve a quantity of the residue in 5 ml of dilute hydrochloric acid, filter; to the filtrate add a few drops of sodium alizarin sulfonate IS; the precipitate becomes cherry red in colour.

(3) Dissolve a quantity of the residue in 3 ml of dilute hydrochloric acid, adjust the solution to neutral with ammonia TS, add 3 ml of ammonia-ammonium chloride (pH 10) BS, filter. Apply several drops of the filtrate to a white porcelain plate, add several drops of sodium hydroxide and 1-2 drops of 5% *p*-nitrobenzene azo-resorcinol solution; a blue precipitate is produced.

(4) To about 0.5 g of the powdered tablets add 5 ml of water and 3 ml of dilute sulfuric acid, it effervesces with the evolution of carbon dioxide, producing a white precipitate when passed into calcium hydroxide TS.

(5) To about 0.5 g of the powdered tablets add 10 ml dilute sulfuric acid boil for 2 minutes, filter while hot, extract the filtrate with 5 ml ether, separate the ether layer, add 2 ml of sodium hydroxide TS, shake, an orange-red colour is produced in the water layer.

(6) To about 1 g of the powdered tablets add 15 ml of methanol, warm gently for 30 minutes, filter. Examine the filtrate under ultraviolet light at 254 nm, a yellowish-green fluorescence is produced.

(7) To about 1 g of the powdered tablets, add 10 ml of ether, shake for 10 minutes and filter. Evaporate the ether extract to dryness in a porcelain evaporating dish, to the residue add 2 drops of 5% vanilline in a sulfuric acid solution (prepared freshly), a purple colour is produced.

(8) Dissolve a quantity of the residue in 3 ml of dilute hydrochloric acid, filter, the filtrate yields the reactions characteristic of sodium salts (Appendix III).

Other requirements Comply with the general requirement for tablets (Appendix I A), with the exception of disintegration test.

Assay *Bismuth* Weigh and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.3 g of bismuth aluminate in a 50 ml crucible, heat gently until it is thoroughly charred, cool. Add 3 ml of nitric acid, heat gently until nitric acid fumes are no longer evolved, ignite until the incineration is complete and cool. Add 20 ml of nitric solution (3→10), transfer the residue into a 500 ml conical flask, cover with a small funnel, heat gently to

reflux until the residue is dissolved (the solution turns slightly turbid). Cool, add 200 ml of water, adjust the pH value to 1.0, add 5 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS until the colour of the solution turns from orange-red to lemon yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Aluminium To the solution after titration of bismuth add ammonia TS dropwise until a precipitate is just formed and redissolve it by adding dropwise dilute nitric acid (about pH 6). Add 15 ml of acetic acid-ammonium acetate BS (pH 6.0) and 50 ml of disodium edetate (0.05 mol/L) VS, accurately measured, heat to boil for 10 minutes, allow to cool, add 5 drops of xylenol orange IS and titrate with zinc (0.05 ml/L) VS until the colour turns from lemon yellow to orange-red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 1.349 mg of Al.

Magnesium oxide Weigh accurately a quantity of the above powdered tablets equivalent to about 0.4 g of magnesium carbonate, in a 50 ml of crucible, heat gently until it is thoroughly charred, cool and add 3 ml of nitric acid. Heat gently until nitric acid fumes are no longer evolved, ignite until the incineration is complete, allow to cool. Add 15 ml of dilute hydrochloric acid and transfer the residue into a 50 ml beaker, heat to boil, then allow to cool. Add 20 ml of water and 1 drop of methyl red IS, then add ammonia TS dropwise until the colour turns from red to yellow. Boil again for 5 minutes, filter while hot, wash the residue with 30 ml of warm 2% ammonium chloride solution. Combine the washings with the filtrate into a 100 ml volumetric flask, dilute to volume with water, mix well. Measure accurately 20 ml of the solution into a conical flask, add 20 ml of water, 5 ml each of ammonia-ammonium chloride BS (pH 10.0) and triethanolamine solution, (1→2), then add a small amount of eriochrome black T indicator, titrate with disodium edetate (0.005 mol/L) VS to blue colour. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.015 mg of MgO.

Category Antacid.

Storage Preserve in tightly closed containers, stored in a dry place.

Compound Bismuth Aluminate Capsules

Compound Bismuth Aluminate Capsules contain not less than 26.4 mg and not more than 32.2 mg of Bismuth Aluminate as bismuth (Bi); not less than 10.2 mg and not more than 12.5 mg of aluminate (Al); not less than 37.3% and not more than 45.7% of the labelled amount of heavy magnesium carbonate calculated as magnesium oxide (MgO) in each capsule.

Formula	Bismuth Aluminate	66.7 g
	Heavy Magnesium Carbonate	133.3 g
	Sodium Bicarbonate	66.7 g
	Powdered Liquorice Extract	100 g
	Rhamnus Frangula	8.3 g
	Fennel Powder	3.3 g
	Excipient	a quantity
	to make	1000 capsules

Description Hard capsules containing pale brown powder.

Identification Heat gently about 1 g of the contents of capsules in a crucible, until it is thoroughly charred, cool, add 3 ml of nitric acid. Heat gently until nitric acid fume is no longer evolved, ignite until the incineration is complete. The residue complies with the following tests:

(1) Dissolve a quantity of the residue in 5 ml of dilute nitric acid, filter, to the filtrate add potassium iodide TS dropwise, a brownish-red precipitate is produced which is dissolved in an excess of potassium iodide TS.

(2) Dissolve a quantity of the residue in 5 ml of dilute hydrochloric acid, filter; to the filtrate add ammonia TS until a white precipitate is produced, add a few drops of sodium alizarin sulfonate IS; the precipitate becomes cherry red in colour.

(3) Dissolve a quantity of the residue in 3 ml of dilute hydrochloric acid, adjust the solution to neutral with ammonia TS, add 3 ml of ammonia-ammonium chloride (pH 10) BS, filter. Apply several drops of the filtrate to a white porcelain plate, add several drops of sodium hydroxide and 1-2 drops of 5% *p*-nitrobenzene azo-resorcinol solution; a blue precipitate is produced.

(4) To about 0.5 g of the contents of capsules add 5 ml of water and 3 ml of dilute sulfuric acid, it effervesces with the evolution of carbon dioxide, producing a white precipitate when passed into calcium hydroxide TS.

(5) To about 0.5 g of the contents of capsules add 10 ml dilute sulfuric acid, boil for 2 minutes, filter while hot, extract the filtrate with 5 ml of ether, separate the ether layer, add 2 ml of sodium hydroxide TS, shake, an orange-red colour is produced in the water layer.

(6) To about 1 g of the contents of capsules add 15 ml of methanol, warm gently for 30 minutes, filter. Examine the filtrate under ultraviolet light at 254 nm, a yellowish-green fluorescence is produced.

(7) To about 1 g of the contents of capsules add 10 ml of ether, shake for 10 minutes and filter. Evaporate the ether extract to dryness in a porcelain evaporating dish, to the residue add 2 drops of 5% vaniline in a sulfuric acid solution (prepared freshly), a purple colour is produced.

(8) Dissolve a quantity of the residue in 3 ml of dilute hydrochloric acid, filter, the filtrate yields the reaction characteristic of sodium salts (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay bismuth Mix the contents obtained in the test for weight variation of contents. Weigh accurately a quantity of the contents equivalent to about 0.3 g of bismuth aluminate in a 50 ml crucible, heat gently until it is thoroughly charred, cool. Add 3 ml of nitric acid, heat gently until nitric acid fumes are no longer evolved, ignite until the incineration is complete and cool. Add 20 ml of nitric solution (3→10), transfer the residue into a 500 ml conical flask, cover with a small funnel, heat gently to reflux until the residue is dissolved (the solution is slightly turbid). Cool, add 200 ml of water, adjust the pH value to 1.0, add 5 drops of xylenol orange IS, Titrate with disodium edetate (0.05 mol/L) VS until the colour of the solution turns from orange-red to lemon yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Aluminium To the solution after titration of bismuth add ammonis TS dropwise until a precipitate is just formed and redissolve it by adding dropwise dilute nitric acid (about pH 6). Add 15 ml of acetic acid-ammonium acetate BS (pH 6.0) and 50 ml of disodium edetate (0.05 mol/L), accurately measured, heat to boil for 10 minutes, allow to cool, add 5 drops of xylenol orange IS and titrate with zinc (0.05 mol/L) VS until the colour turns from lemon yellow to orange-red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05

mol/L) VS is equivalent to 1.349 mg of Al.

Magnesium oxide Weigh accurately a quantity of the contents equivalent to about 0.4 g of heavy magnesium carbonate, in a 50 ml of crucible, heat gently until it is thoroughly charred, cool and add 3 ml of nitric acid. Heat gently until nitric acid fumes are no longer evolved, ignite until the incineration is complete, allow to cool. Add 15 ml of dilute hydrochloric acid and transfer the residue into a 50 ml beaker, heat to boil to dissolve the residue, then allow to cool. Add 20 ml of water and 1 drop of methyl red IS, then add ammonia TS dropwise until the colour turns from red to yellow. Boil again for 5 minutes, filter while hot, wash the residue with 30 ml of warm 2% ammonium chloride solution. Combine the washings with the filtrate into a 100 ml volumetric flask, dilute to volume with water, mix well. Measure accurately 20 ml of the solution into a conical flask, add 20 ml of water, 5 ml each of ammonia-ammonium chloride BS (pH 10.0) and triethanolamine solution, (1→2), then add a small amount of eriochrome black T indicator, titrate with disodium edetate (0.05 mol/L) VS until the colour turns to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.015 mg of MgO.

Category Antacid.

Storage Preserve in tightly closed containers, stored in a dry place.

Bismuth Potassium Citrate

Bismuth Potassium Citrate is a bismuth complex of indefinite composition. It contains not less than 35.0% and not more than 38.5% of bismuth (Bi), calculated on the dried basis.

Description A white powder; taste saline; hygroscopic. Very soluble in water; very slightly soluble in ethanol.

Identification (1) Dissolve about 1 mg in 5 ml of water, add 2-3 drops of dilute sulfuric acid and several drops of thiourea solution (1→10), a deep yellow colour is produced.

(2) Dissolve about 0.1 g in 5 ml of water, add 3 drops of perchloric acid solution (1→10), a white turbidity or precipitate is produced which is insoluble in sodium hydroxide TS or concentrate ammonia solution.

(3) Dissolve about 10 mg in 0.2 ml of water, add 5 ml of a mixture of pyridine acetic anhydride (3:1), shake, a yellow to red or purplish red colour is produced.

Acidity or alkalinity Dissolve 0.60 g in 10 ml water, pH 6.0-8.0 (Appendix VI H)

Sulfate Dissolve 1.0 g in 20 ml of water, add 4 ml dilute hydrochloric acid, heat on water bath for 10 minutes, cool and filter. Divide the filtrate into two equal portions. To one portion add 5 ml of 25% barium chloride solution, mix well, allow to stand for 10 minutes, filter repeatedly until the filtrate is clear. Dilute with water to produce about 40 ml, add 2.0 ml of potassium sulfate standard solution, dilute with water to 50 ml, mix well, allow to stand for 10 minutes, use as reference solution. To another portion dilute with water to 40 ml, add 5 ml of 25% barium chloride solution, dilute with water to 50 ml, mix well, allow to stand for 10 minutes. Any opalescence produced is not more intense than that of the reference preparation (0.04%).

Nitrate Dissolve 0.50 g in 5 ml of water in a test tube, mix cautiously with 5 ml of sulfuric acid, cool, add 5 ml of

ferrous sulfate TS along the inner wall of the test tube, a brown ring is not developed immediately at the interface of the two layers.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Copper Dissolve 0.20 g in 2 ml of water, add 2 ml of ammonium citrate solution (1→10), adjust the pH value to 8-9 with ammonia TS, add 5 ml of dilute ethanolic solution of 0.1% dicyclohexyl ketone oxalodihydrazone and dilute with water to 50 ml. Repeat the operation, using 0.50 ml IS prepare the reference solution. Any colour produced is not more intense than that of 0.50 ml of standard cupric sulfate solution (each ml is equivalent to 10 µg of Cu) (0.0025%).

Lead Ignite 1.0 g at 600°C until the incineration is complete, cool, add nitric acid dropwise to dissolve the residue, heat on a water bath to dryness, cool, add 5 ml of potassium hydroxide solution (1→6), heat to boil for 2 minutes, cool and filter. Wash the residue with a small amount of water, combine the filtrate and washings, adjust to pH 7 with acetic acid, dilute with water to 25 ml. Add 2 ml of dilute acetic acid and 10 ml of hydrogen sulfide TS, allow to stand for 10 minutes. Any colour produced is not more intense than that of a reference using 2.0 ml of lead standard solution operated in similar manner (0.002%).

Ammonia content Weigh accurately about 1 g, carry out the method for determination of nitrogen (Appendix VII D, method 1), beginning at the words "add cautiously 250 ml of water..." (but add 30 ml of 40% sodium hydroxide solution). Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 1.703 mg of NH₃. It contains not less than 2% and not more than 6% of ammonia.

Assay Dissolve about 0.5 g, accurately weighed, in 50 ml of water, add 3 ml of nitric acid solution (1→3) and 2 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS to pale yellow colour. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category anti-ulcerative.

Storage Preserve in tightly closed containers, protected from light, stored in a dry place.

Preparation (1) Bismuth Potassium Citrate Capsules
(2) Bismuth Potassium Citrate Granules
(3) Bismuth Potassium Citrate Tablets

Bismuth Potassium Citrate Capsules

Bismuth Potassium Citrate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of bismuth (Bi).

Description Capsules containing white granules.

Identification To a quantity of the powdered granules equivalent to about 220 mg of bismuth add 50 ml of water, stir thoroughly to dissolve bismuth potassium citrate, and filter, comply with test (1)(2)(3) for Identification described under Bismuth Potassium Citrate, using the filtrate.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 200 mg of Bi, add 18 ml diluted nitric acid, shake thoroughly to dissolve bismuth potassium

citrate, add 50 ml of water, mix well, add 3 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS until the solution turns to yellow. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category As described under Bismuth Potassium Citrate.

Strength 0.3 g (equivalent to 110 mg of Bi)

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Bismuth Potassium Citrate Granules

Bismuth Potassium Citrate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of bismuth (Bi).

Description White to pale yellow granules; taste, slightly sweet.

Identification To a quantity equivalent to about 220 mg of bismuth add 50 ml of water, stir thoroughly to dissolve bismuth potassium citrate and filter. Comply with test (1)(2)(3) for Identification described under Bismuth Potassium Citrate, using the filtrate.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Weigh accurately a quantity of the powdered contents obtained in the test for weight variation equivalent to about 180 mg of Bi, add 50 ml of water, shake thoroughly to dissolve bismuth potassium citrate. Add 5 ml of nitric acid solution (1→5) and 2 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS to yellow colour. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category As described under Bismuth Potassium Citrate.

Strength (1) 1.0 g (equivalent to 110 mg of Bi)
(2) 1.2 g (equivalent to 110 mg of Bi)

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Bismuth Potassium Citrate Tablets

Bismuth Potassium Citrate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of bismuth (Bi).

Description White tablets or film-coated tablets with white cores.

Identification To a quantity of the powdered tablets, equivalent to about 220 mg of Bi, add 50 ml of water, shake thoroughly to dissolve bismuth potassium citrate and filter. Complies with test (1)(2)(3) for Identification described under Bismuth Potassium Citrate, using the filtrate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 180 mg of Bi, add 50 ml of water, shake thoroughly to dissolve bismuth potassium citrate. Add 5 ml of nitric acid solution

(1 → 5) and 2 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS to yellow colour. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category As described under Bismuth Potassium Citrate.

Strength 0.3 g (equivalent to 110 mg of Bi)

Storage Preserve in tightly closed containers, stored in cool place, protected from light.

Bismuth Subcarbonate

[5892-10-4]

Bismuth Subcarbonate is a basic bismuth salt of indefinite composition. It contains not less than 80.0% and not more than 82.5% of bismuth (Bi), calculated on the dried basis.

Description A white to slightly pale yellow powder; odourless; tasteless; deteriorated slowly on exposure to light.

Insoluble in water or ethanol.

Identification (1) To about 0.2 g add 2 ml of dilute hydrochloric acid, it dissolves with effervescence. Divide this solution to two equal parts. Dilute one part with water, a white precipitate is produced which changes to brown colour on adding sodium sulfide TS. Add 1 ml of 10% thiourea solution to the other part, a deep yellow colour is produced.

(2) Dissolve about 50 mg in 1 ml of nitric acid, add 10 ml of water. To 2 ml of this solution, add potassium iodide TS dropwise, a brownish-black precipitate is produced which is dissolved in an excess of potassium iodide TS to form a yellowish-orange solution.

Chloride Dissolve 0.20 g in 4 ml of nitric acid, add a quantity of water to produce 20 ml. Carry out the limit test for chlorides (Appendix VIII A) using accurately measured 5.0 ml. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.14%).

Sulfate Dissolve 1.0 g in 2 ml of hydrochloric acid, pour into 40 ml of water, a lot of white precipitate is produced. Add ammonia TS dropwise until the solution is neutral to litmus paper, add water to 50 ml and mix well, filter. Carry out the limit test for sulfates (Appendix VIII B), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 1.0 ml of potassium sulfate standard solution (0.02%).

Nitrate To 0.10 g add 8 ml of water and 2 ml of indigo carmine TS, then add cautiously 10 ml of sulfuric acid. When effervescence is ceased, heat to boil and allow to stand for 1 minute; the blue colour of the solution is not discharged completely.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.5% of its weight (Appendix VIII L).

Alkali and alkaline earth salts Boil 1.0 g with 20 ml of acetic acid-water (1:1) for 2 minutes, cool, filter and wash the residue with water. To the combined filtrate and washings, add 2 ml of dilute hydrochloric acid and pass hydrogen sulfide into the solution until no further precipitate is formed. Filter, add 5 drops of sulfuric acid to the filtrate, evaporate to dryness and ignite to constant weight; the residue weighs not more than 5 mg.

Copper Dissolve 1.0 g in 2 ml of hydrochloric acid, pour into 40 ml of water, a lot of white precipitate is produced, add water to 50 ml, mix well and filter. To 5 ml of the filtrate add ammonia TS dropwise until the solution is neutral to litmus paper, add 5 ml more, filter and wash the precipitate with two quantities of 5 ml each of water. To the combined filtrate and washings add 5 ml of sodium diethyldithiocarbamate TS and water to produce 50 ml. Any colour produced is not more intense than that of a reference solution prepared by mixing 0.5 ml of copper sulfate solution (measure accurately 2.5 ml of standard copper sulfate CS in an 100 ml volumetric flask, dilute to volume with water and mix well. Measure accurately 2.5 ml of the above solution into another 100 ml volumetric flask, dilute with water to volume and mix well. Each ml is equivalent to 10 µg of Cu), 5 ml of ammonia TS, 5 ml of sodium diethyl-dithiocarbamate TS and water to 50 ml (0.005%).

Silver Dissolve 1.0 g in 5 ml of nitric acid, add 15 ml of water and 2 drops of dilute hydrochloric acid, no turbidity is produced.

Lead Transfer separately two portions of 3.0 g into 50 ml of volumetric flask and dissolve in 10 ml of nitric acid; dilute the one portion with water to volume, mix well (test solution) and to another portion add 6 ml of standard lead solution and dilute with water to volume, mix well (reference solution). Carry out the method for atomic absorption spectrophotometry (Appendix IV D) and measure the absorbance of the two solution at 283.3 nm. It complies with the requirements.

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 23 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 1). Complies with the requirements (0.0002%).

Assay Dissolve about 0.2 g, accurately weighed, in 5 ml of nitric acid solution (3 → 10), add 100 ml of water and 3 drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS to pale yellow colour. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category Antacid, astringent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Bismuth Subcarbonate Tablets

Bismuth Subcarbonate Tablets

Bismuth Subcarbonate Tablets contain not less than 75.0% and not more than 85.0% of the labelled amount of bismuth subcarbonate calculated as bismuth (Bi).

Description White to slightly pale yellow tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.3 g of bismuth subcarbonate add 3 ml of dilute hydrochloric acid, an effervescence takes place. Add 10 ml of water, filter, divide the filtrate into three parts; dilute part (1) with water; a white precipitate is produced which changes to brown colour on addition of sodium sulfide TS. To part (2) add 1 ml of 10% thiourea solution; a deep yellow colour is produced. To part (3) add potassium iodide TS, a brownish-black precipitate is produced which is dissolved in an excess of potassium iodide TS to form yellowish-orange solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 0.2 g of bismuth subcarbonate. Carry out the Assay described under Bismuth Subcarbonate, beginning at the words "dissolve in 5 ml of nitric acid solution (3→10)...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category As described under Bismuth Subcarbonate.

Strength (1) 0.3 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Black Ferric Oxide

Fe_3O_4 231.53

Black Ferric Oxide contains not less than 96.0% of Fe_3O_4 , calculated on the dried basis.

Description A black powder; odourless; tasteless. Insoluble in water; freely soluble in boiling hydrochloric acid.

Identification Boil about 0.1 g with 5 ml of dilute hydrochloric acid, allow to cool, the solution yields the reactions characteristic of ferric salts (Appendix III).

Water soluble substances To 2.0 g add 100 ml of water, heat under reflux on a water bath for 2 hours and filter. Wash the residue with a quantity of water, evaporate the combined filtrate and washings to dryness in an evaporating dish previously dried to constant weight at 105°C, dry the residue to constant weight at 105°C; not more than 10 mg (0.5%).

Acid insoluble substances Dissolve 2.0 g in 25 ml of hydrochloric acid by heating in a water bath, add 100 ml of water, filter through a sintered glass crucible (No. 4) previously dried to constant weight at 105°C, wash the residue with hydrochloric acid solution (1→100) until the washings become colourless, then wash the residue with water until the washings give no reaction of chlorides, dry the residue to constant weight at 105°C; not more than 20 mg (1.0%).

Loss on ignition When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Barium To 0.2 g add 5 ml of hydrochloric acid, heat until dissolved. Add 1 drop of hydrogen peroxide TS and 20 ml of 10% sodium hydroxide solution, filter, wash the residue with 10 ml of water. Combine the filtrate and washings, add 10 ml of sulfuric acid solution (2→10), no opalescence is produced.

Lead To 0.5 g add 10 ml of hydrochloric acid, heat until dissolved. Add 3 ml of nitric acid, boil for 1 minute, allow to cool. Extract with anhydrous ether for 4 times (30 ml, 20 ml, 20 ml and 20 ml), discard the ether layer. Heat the acid solution to expel the remaining ether, add ammonia TS to make the solution alkaline, add 1 ml of potassium cyanide TS and sufficient water to produce 50 ml. Add a few drops of sodium sulfide TS and mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner using 1.5 ml of lead standard solution (0.003%).

Arsenic To 0.2 g add 7 ml of hydrochloric acid, heat until dissolved. Add 21 ml of water, and add acid stannous

chloride TS dropwise until the yellow colour disappears. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.001%.

Assay To about 0.15 g, accurately weighed, in a conical flask with stopper add 30 ml of hydrochloric acid solution (1→2), heat until dissolved. Continue to heat until the solution begins to boil. Add freshly prepared stannous chloride TS dropwise until the solution is just colourless. Then add 1 drop of freshly prepared stannous chloride TS in excess and 200 ml of water, allow to cool, add 4 ml of mercuric chloride TS, mix well, then add 3 ml of sulfuric acid and 3 ml of phosphoric acid. Add 6 drops of 0.2% diphenylamine sulfonic acid sodium IS, titrate with potassium dichromate (0.01667 mol/L) VS until a purple blue colour persists for 30 seconds. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 7.72 mg of Fe_3O_4 .

Category Pharmaceutical aid, colouring agent.

Storage Preserve in tightly closed containers.

Bleomycin A5 Hydrochloride for Injection

$\text{C}_{57}\text{H}_{89}\text{N}_{19}\text{O}_{21}\text{S}_2 \cdot n\text{HCl}$

Bleomycin A5 Hydrochloride for Injection is a sterile lyophilized powder of bleomycin A5 hydrochloride. It contains not less than 80.0% of bleomycin A5 hydrochloride, calculated on the dried basis. Each container contains not less than 85.0% and not more than 115.0% of the labelled amount of bleomycin A5 hydrochloride, calculated on the basis of the average weight of contents.

Description A white friable solid or amorphous solid; odourless or almost odourless; hygroscopic. Freely soluble in water or methanol; slightly soluble in ethanol; practically insoluble in acetone, chloroform or ether.

Identification (1) Carry out the method for high performance liquid chromatography as described under the Assay. The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of Bleomycin A5 hydrochloride CRS.

(2) Dissolve 0.4 mg in 10 ml of water and add 0.05 ml of 3% copper sulfate solution, the light absorption of the resulting solution exhibits maxima at 242 nm and 291 nm (Appendix IV A).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity An aqueous solution of 4 mg per ml, pH 4.5-6.0 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce solutions of 4 mg per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 6.0% of its weight (Appendix VII L).

Copper Dissolve 15 mg, accurately weighed, in a 10 ml volumetric flask with 3 ml of hydrochloric acid solution (0.1 mol/L). Transfer 3 ml of standard copper solution [Weigh accurately 1.965 g of copper sulfate (CuSO₄ • 5H₂O) to a 1000 ml volumetric flask, dissolve in 0.1 mol/L hydrochloric acid solution and dilute to volume, mix well, Transfer accurately 5 ml to a 500 ml volumetric flask, add 0.1 mol/L hydrochloric acid to volume. Each ml of the solution is equivalent to 5 µg of copper.] to another 10 ml volumetric flask; add separately 0.4 ml of 3% acacia solution, mix well, followed with 2 ml of sodium diethyldithiocarbamate TS and dilute with 0.1 mol/L hydrochloric acid solution to volume as test solution and copper standard solution respectively. Measure the absorbances of the solutions at 450 nm (Appendix IV A), using 0.1 mol/L hydrochloric acid solution as the blank. Calculate the content of copper; not more than 0.1%.

Content uniformity To each of 10 containers add water to produce 200 ml respectively, and measure the absorbance of the resulting at 291 nm (Appendix IV A). Not more than one of the individual absorbance deviates from the average absorbance by more than ±15% and none deviates by more than ±20%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 25 EU per mg.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolve each container in feasible solvent and dilute with 500 ml of 0.9% steril sodium chloride solution respectively.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium 1-pentane sulfonate solution (dissolve 0.96 g of sodium 1-pentane sulfonate and 1.86 g of disodium edetate in 0.08 mol/L acetic acid solution, dilute to 1000 ml and adjust to pH 4.3 with ammonia solution)-methanol-acetonitrile (76:16:8) as the mobile phase; wavelength of the detector is 254 nm and the number of theoretical plates of the column is not less than 700, calculated with reference to the peak of bleomycin A5.

Procedure Dissolve about 10 mg of the mixed contents obtained from the test for weight variation of contents, accurately weighed, in water and dilute to 10 ml, inject 10 µl into the column. Repeat the operation using bleomycin A5 hydrochloride CRS instead of the substance being examined, calculate the content of C₅₇H₈₉N₁₉O₂₁S₂ • nHCl with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antineoplastic antibiotic.

Strength Calculated as Bleomycin A5 Hydrochloride
(1) 4 mg (2) 8 mg

Storage Preserve in tightly closed containers, stored in a

dry, cool and dark place.

Borax

Na₂B₄O₇ • 10H₂O 381.37

[1303-96-4]

Borax is sodium tetraborate. It contains not less than 99.0% and not more than 105.0% of Na₂B₄O₇ • 10H₂O.

Description Colourless, translucent crystals or a white crystalline powder; odourless; efflorescent; its aqueous solution exhibits an alkaline reaction.

Freely soluble in boiling water or glycerin; soluble in water; insoluble in ethanol.

Identification Its aqueous solution yields the reactions characteristic of sodium salts and borates (Appendix III).

Clarity of solution A solution of 0.5 g in 10 ml of water is clear. Any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B).

Chlorides Carry out the limit test for chlorides (Appendix VIII A), using 0.25 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.04%).

Carbonates and bicarbonates Dissolve 0.25 g in 5 ml of water. Add hydrochloric acid, no effervescence is produced.

Calcium Dissolve 0.25 g in 10 ml of water, acidify with acetic acid, add 1.0 ml of ammonium exalate TS, allow to stand for 1 minute, add 5 ml of ethanol, mix well. Any opalescence produced after 15 minutes is not more pronounced than that of a reference solution prepared in the same manner, using 2.5 ml of calcium standard solution (weigh accurately 0.125 g of calcium carbonate, previously dried to constant weight at 105-110°C, to a 500 ml volumetric flask. Add 5 ml of water and 0.5 ml of hydrochloric acid to dissolve, it dilute with water to volume, mix well. Measure accurately 10 ml, dilute with water previous to use in a 100 ml volumetric flask to volume and mix well. Each ml is equivalent to 10 µg of Ca) (0.01%).

Iron Dissolve 1.0 g in 25 ml of water. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference using 3.0 ml of iron standard solution (0.003%).

Heavy metals Dissolve 1.0 g in 16 ml of water, add dropwise 1 mol/L hydrochloric acid solution until congo red TP turns to bluish-violet, add water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.4 g, accurately weighed, in 25 ml of water, add 1 drop of 0.05% methyl orange IS and titrate with hydrochloric acid (0.1 mol/L) VS until the solution becomes reddish-orange, boil for 2 minutes, allow to cool. If the solution is yellow, continue the titration until the colour changes to reddish-orange. Add 80 ml of neutral glycerin [add 20 ml of water and 1 drop of phenolphthalein IS to 80 ml of glycerin, titrate with sodium hydroxide (0.1 mol/L) VS to a pink colour] and 8 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS until the solution becomes pink. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 9.534 mg of Na₂B₄O₇ • 10H₂O.

Category Antiseptics.

Storage Preserve in tightly closed containers.

Boric Acid

H_3BO_3 61.83 [10043-35-3]

Boric Acid contains not less than 99.5% of H_3BO_3 .

Description Colourless or slightly pearly crystals or a white loose powder; unctuous on touching; odourless; its aqueous solution exhibits a weak acidic reaction. Freely soluble in boiling water, boiling ethanol or glycerin; soluble in water or ethanol.

Identification Its aqueous solution yields the reactions characteristic of borates (Appendix III).

Clarity of solution Dissolve 1.0 g in 25 ml of warm water, cool to room temperature. The solution is clear. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Clarity of ethanolic solution Dissolve 1.0 g in 10 ml of boiling ethanol. The solution is clear. Any opalescence produced is not more pronounced than that of reference suspension 2 (Appendix IX B).

Chlorides Carry out the limit test for chlorides (Appendix VIII A), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.01%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.04%).

Phosphates Dissolve 0.50 g in 15 ml of water, add 2 drops of saturated 2,4-dinitrophenol solution, add dropwise sulfuric acid solution (12→100) until the yellow colour disappears, dilute with water to 20 ml. Add 4 ml of sulfuric acid solution (12→100), 1 ml of 5% ammonium molybdate solution and 1.0 ml of *p*-methylaminophenol sulfate TS, mix well. Warm the solution in a water bath at 60°C for 10 minutes. Any colour produced is not more intense than that of a reference solution prepared in the same manner, using 5.0 ml of phosphate standard solution (weigh accurately 0.1430 g of potassium dihydrogen phosphate into a 1000 ml volumetric flask, add water to volume, mix well. Transfer 10 ml, accurately measured, to a 100 ml volumetric flask, dilute with water to volume, shake well. Each ml is equivalent to 10 µg of PO_4) (0.01%).

Calcium Dissolve 0.50 g in 10 ml of water, make alkaline with ammonia TS, then add 0.5 ml of ammonium oxalate, 5 ml of ethanol and sufficient water to produce 20 ml, mix well. Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner, using 5.0 ml of calcium standard solution described under Borax (0.01%).

Magnesium Dissolve by warming slightly 0.50 g in 8 ml of water, neutralize with 8% sodium hydroxide solution, add water to 10 ml and add 5 ml of sodium hydroxide, add 0.2 ml of 0.05% titan yellow IS, mix well. Any colour produced is not more intense than that of a reference solution prepared in the same manner, using 5.0 ml of magnesium standard solution (dissolve 16.58 mg of magnesium oxide, previously ignited to constant weight at 800°C, in 2.5 ml of hydrochloric acid and sufficient water to produce 1000 ml, mix well) (0.01%).

Iron Dissolve 1.0 g in 25 ml of water. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference using 1.0 ml of iron standard solution (0.001%).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Assay Weigh accurately about 0.50 g, add 5 g of mannitol and 25 ml of freshly boiled and cooled water, warm gently to dissolve, cool rapidly to room temperature. Add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.5 mol/L) VS until the solution becomes pink. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalent to 30.92 mg of H_3BO_3 .

Category Antiseptics.

Storage Preserve in tightly closed containers.

Preparation Boric Acid Ointment

Boric Acid Ointment

Boric Acid Ointment contains not less than 4.50% and not more than 5.50% of boric acid (H_3BO_3).

Description A pale yellow or yellow ointment.

Identification To about 0.5 g add 4 ml of water and heat on a water bath with stirring to dissolve boric acid, cool to room temperature. The aqueous solution yields the reactions characteristic of borates (Appendix III).

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay To about 2 g, accurately weighed, add 3 g of mannitol and 20 ml of freshly boiled and cooled water, heat on a water bath with stirring to dissolve boric acid, cool to room temperature. Add 3 drops of phenolphthalein IS and titrate with sodium hydroxide (0.1 mol/L) VS until the solution becomes pink. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 6.183 mg of H_3BO_3 .

Category As described under Boric Acid.

Storage Preserve in tightly closed containers.

Bromhexine Hydrochloride

$\text{C}_{14}\text{H}_{20}\text{Br}_2\text{N}_2 \cdot \text{HCl}$ 412.60 [611-75-6]

Bromhexine Hydrochloride is *N*-methyl-*N*-cyclohexylmethylamine-2-amino-3,5-dibromobenzyl hydrochloride. It contains not less than 98.5% of $\text{C}_{14}\text{H}_{20}\text{Br}_2\text{N}_2 \cdot \text{HCl}$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless. Slightly soluble in ethanol or chloroform; very slightly soluble in water.

Specific absorbance Measure the absorbance of a solution of 20 µg per ml in ethanol at 249 nm (Appendix IV A), the value of A (1%, 1 cm) is 262-278.

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bromhexine hydrochloride (Appendix XVI).

(2) Dissolve 10 mg in 1 ml of ethanol by warming, the solution yields the reactions characteristic of primary aromatic amines (Appendix III).

(3) Take 50 mg, carry out the method for oxygen flask combustion (Appendix VII C), using 5 ml of 0.4% sodium hydroxide solution as the absorbing liquid. After the combustion is complete, neutralize it with dilute nitric acid. The solution yields the reactions characteristic of bromides (Appendix III).

(4) Dissolve 10 mg in 2 ml of ethanol by warming, the solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-dehydrated ethanol (9:1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 20 mg per ml and (2) 50 µg per ml. After developing and removal of the plate, dry it in air. Place the plate in a closed tank containing a freshly prepared mixture of 1.0 g of sodium nitrite and 10 ml of 5 mol/L hydrochloric acid solution and allow to stand for 1 minute. Remove the plate and immediately spray with 0.5% N-(1-naphthyl)-ethylene diamine dihydrochloride in methanol. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the Residue on ignition; not more than 0.002%.

Assay To about 0.25 g, accurately weighed, add 20 ml of glacial acetic acid and warm gently to dissolve. Allow to cool, add 5 ml of mercuric acetate TS and one drop of crystal violet IS, until the colour changes to blue. Titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 41.26 mg of $C_{14}H_{20}Br_2N_2 \cdot HCl$.

Category Expectorant.

Storage Preserve in tightly closed containers.

Preparation Bromhexine Hydrochloride Tablets

Bromhexine Hydrochloride Tablets

Bromhexine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of bromhexine hydrochloride ($C_{14}H_{20}Br_2N_2 \cdot HCl$).

Description White tablets.

Identification The light absorption of the solution obtained in the Assay exhibits maxima at 249 nm and 310 nm (Appendix IV A).

Related substances Weigh a quantity of powdered tablets equivalent to about 50 mg of bromhexine hydrochloride, add 5 ml of methanol, shake thoroughly, and centrifuge. Use the supernatant liquid as solution (1) and 1 ml of supernatant liquid diluted with methanol to 400 ml as solution (2). Apply separately to the plate 20 µl each of two solutions. Carry out the test for Related substances described under Bromhexine Hydrochloride. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with ethanol in a mortar and transfer with ethanol to a 50 ml volumetric flask, slightly warm to make bromhexine hydrochloride dissolved, dilute with ethanol to volume, mix well and filter. Dilute 5 ml of successive filtrate with ethanol to 50 ml and mix well. Measure the absorbance of the resulting solution at 249 nm (Appendix IV A), calculate the content of $C_{14}H_{20}Br_2N_2 \cdot HCl$, taking 270 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to 20 mg of bromhexine hydrochloride to a 100 ml volumetric flask. Add 20 ml of ethanol, warm to dissolve, dilute with ethanol to volume and mix well. Filter, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute with ethanol to volume, mix well. Measure the absorbance at 249 nm (Appendix IV A). Calculate the content of $C_{14}H_{20}Br_2N_2 \cdot HCl$, taking 270 as the value of A (1%, 1 cm).

Category As described under Bromhexine Hydrochloride.

Strength 8 mg

Storage Preserve in tightly closed containers.

Bucinnazine Hydrochloride

$C_{17}H_{24}N_2O \cdot HCl$ 308.85

Bucinnazine Hydrochloride is 1-*n*-butyryl-4-cinnamyl-piperazine hydrochloride. It contains not less than 99.0% of $C_{17}H_{24}N_2O \cdot HCl$, calculated on the dried basis.

Description White crystalline powder; odour, characteristic; taste, bitter.

Freely soluble in water or chloroform, soluble in ethanol, insoluble in benzene.

Melting range 204-208°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 50 mg in 1 ml of water, add bromine TS; the colour is faded.

(2) Dissolve about 50 mg in 2 ml of water, add silver nitrate TS; A white precipitate is produced.

(3) Dissolve about 50 mg in 1 ml of water, add several drops of 1% trinitrophenol TS; a yellow precipitate is produced.

(4) The infrared absorption spectrum (Appendix IV C) is

concordant with the reference spectrum of bucinnazine hydrochloride (Appendix XVI).

Clarity of solution Dissolve 1.0 g with 10 ml of water, the solution is clear.

Acidity The solution obtained in Clarity of solution has a pH value of 3.0-4.0 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid and 5 ml of mercuric acetate, add 2 drops of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour of the solution changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 30.89 mg of $C_{17}H_{24}N_2O \cdot HCl$.

Category Analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Bucinnazine Hydrochloride Injection
(2) Bucinnazine Hydrochloride Tablets

Bucinnazine Hydrochloride Injection

Bucinnazine Hydrochloride Injection is a sterile solution of Bucinnazine Hydrochloride in Water for Injections. It contains not less than 93.0% and not more than 107.0% of the labelled amount of bucinnazine hydrochloride ($C_{17}H_{24}N_2O \cdot HCl$).

Description A clear, colourless liquid.

Identification Complies with the tests for Identification (1), (2) and (3) described under Bucinnazine Hydrochloride.

pH value 3.0-4.5 (Appendix VI H)

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 50 mg of bucinnazine hydrochloride into a 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well. Measure accurately 2 ml to 200 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well, carry out the method for spectrophotometry and measure the absorbance at 252 nm (Appendix IV A), calculate the content of $C_{17}H_{24}N_2O \cdot HCl$, taking 671 as the value of A (1%, 1 cm).

Category As described under Bucinnazine Hydrochloride.

Strength (1) 2 ml : 50 mg (2) 2 ml : 100 mg

Storage Preserve in well closed containers, protected from light.

Bucinnazine Hydrochloride Tablets

Bucinnazine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of bucinnazine hydrochloride ($C_{17}H_{24}N_2O \cdot HCl$).

Description White or almost white tablets.

Identification Dissolve a quantity of the powdered tablets equivalent to about 0.1 g of bucinnazine hydrochloride in 5 ml of water, shake to dissolve and filter. The filtrate complies with the tests for Identification (1), (2) and (3) described under Bucinnazine Hydrochloride.

Dissolution Comply with dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium. Adjust the rotation speed at 75 rpm. Withdraw and filter 5 ml of the solution after 30 minutes, filter. Measure accurately 2 ml of the successive filtrate to a 100 ml volumetric flask, dilute with dissolution medium to volume, mix well. Measure the absorbance of the resulting solution at 252 nm (Appendix IV A) and calculate the dissolution of $C_{17}H_{24}N_2O \cdot HCl$, from each tablet taking 671 as the value of A (1%, 1 cm). The amount of the dissolution for each tablets is not less than 70% of the labelled amount.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve a quantity, accurately weighed, equivalent to about 30 mg of Bucinnazine Hydrochloride in 0.1 mol/L hydrochloric acid solution in a 100 ml volumetric flask, dilute to volume, mix well and filter. Measure accurately 2 ml of the successive filtrate to a 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well. Measure the absorbance of the resulting solution at 252 nm (Appendix IV A). Calculate the content of $C_{17}H_{24}N_2O \cdot HCl$, taking 671 as the value of A (1%, 1 cm).

Category As described under Bucinnazine Hydrochloride.

Strength 30 mg

Storage Preserve in tightly closed containers, stored in dry place.

Bulleyaconitine A

$C_{35}H_{49}NO_{10}$ 643.77

Bulleyaconitine A is (1 α ,6 α ,14 α ,16 β) Tetrahydro-8,13,14-triol-20-ethyl-1,6,16-trimethoxy-4-methoxy-8-acetyloxy-14-(4'-para-methoxybenzoate)-aconitane. It contains not less than 97.0% of Bulleyaconitine A, calculated on the dried basis.

Description White crystals or a crystalline powder. Freely soluble in ethanol, chloroform or ether; insoluble in water; very soluble in diluted hydrochloric acid or diluted sulfuric acid.

Melting range 160-165°C (Appendix VI C).

Identification (1) Dissolve about 10 mg in 0.1 mol/L hydrochloric acid solution, divide to two portions. Add a few drops of mercuric potassium iodide TS in one portion, a white precipitate is produced. Add a few drops of potassium

heptaiodobismuthate TS in another portion, an orange-red precipitate is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of bulleyaconitine A CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of bulleyaconitine A CRS.

Other alkaloids Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 0.2 mg per ml as the test solution and of 4 μg per ml as the reference solution. Inject 20 μl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject separately 20 μl each of the test solution and the reference solution, accurately measured, into the column. Record the chromatogram for twice the retention time of principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with reference solution.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue solvent Methanol, chloroform and benzene Carry out the method for residue solvent (Appendix VIII P, method 2), using a capillary column coated with dimethylpolysiloxane as the stationary phase. Maintain the temperature of the column at 50°C for 2 min, then raise the temperature at a rate of 10°C per minute to 70°C and maintain at 70°C for 3 min, then raise the temperature at a rate of 20°C per minute to 200°C and maintain at 200°C for 3 minutes; maintain injection port temperature at 220°C and detector temperature at 280°C. Headspace sampling parameters; the temperature of equilibration is 80°C, and the time of equilibration is 10 minutes.

Procedure Dissolve a quantity of the substance to be examined, accurately weighed, in dimethylformamide to produce a solution of 0.1 g per ml as test solution. Dissolve a quantity of methanol, chloroform and benzene, accurately weighed respectively, in dimethylformamide to produce a solution containing methanol, chloroform, benzene of 300 μg , 6 μg and 0.2 μg as reference solution. Transfer separately 3 ml each of test solution and reference solution, accurately measured, into different headspace sample vials. Calculate the content of methanol, chloroform and benzene respectively with respect to the peak area obtained in the chromatogram by the external standard method.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and mixture of 0.2% triethylamine solution (adjust to pH 3.1 ± 0.1 with phosphoric acid)-acetonitrile as the mobile phase. Detection wavelength is 260 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of bulleyaconitine A.

Procedure Dissolve about 20 mg, accurately weighed, in mobile phase in a 100 ml volumetric flask and dilute to volume with the same solvent and mix well. Transfer 5 ml of the solution into a 50 ml volumetric flask, accurately measured, dilute with mobile phase to volume and mix well, inject 20 μl of the solution into the column, accurately measured. Repeat the operation, using bulleyaconitine A CRS instead of the substance being examined. Calculate the content of $\text{C}_{35}\text{H}_{49}\text{NO}_{10}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Anti-inflammatory, analgesic agent.

Storage Stored in dry and cool place, protected from light.

Preparation (1) Bulleyaconitine A Oral Solution
(2) Bulleyaconitine A Tablets

Bulleyaconitine A Oral Solution

Bulleyaconitine A Oral Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of Bulleyaconitine A ($\text{C}_{35}\text{H}_{49}\text{NO}_{10}$).

Description A pale yellow, clear liquid; taste, sweet; slightly sour and slight numb.

Identification (1) To 40 ml, adjust pH to 9-10 by adding 0.5 mol/L sodium carbonate solution, extract the solution twice with 40 ml of ethyl ether. Evaporate the extracts to dryness on a water bath, the residue complies with the test for Identification (1) described under Bulleyaconitine A.
(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of bulleyaconitine A CRS.

Relative density Not less than 1.050 (Appendix VI A).

pH value 4.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for oral solution (Appendix I O).

Assay Dilute an accurately measured quantity of the substance being examined with mobile phase to produce a solution of 20 μg per ml. Carry out the Assay as described under Bulleyaconitine A, beginning at the words "inject 20 μl into the column...", calculate the content of $\text{C}_{35}\text{H}_{49}\text{NO}_{10}$.

Category As described under Bulleyaconitine A.

Strength 10 ml : 0.4 mg

Storage Preserve in tightly closed containers, protected from light.

Bulleyaconitine A Tablets

Bulleyaconitine A Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Bulleyaconitine A ($\text{C}_{35}\text{H}_{49}\text{NO}_{10}$).

Description White tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 1 mg of bulleyaconitine A, add 10 ml of 0.1 mol/L hydrochloric acid solution, shake to dissolve bulleyaconitine A and filter. Divide the filtrate to two portions. Add a few drops of mercuric potassium iodide TS in one portion, a white precipitate is produced. Add a few drops of potassium iodobismuthate TS in another portion, an orange-red precipitate is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of bulleyaconitine A CRS.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Dissolve 1 tablet in a 25 ml volumetric flask with mobile phase. Carry out the method as described under Assay, beginning at the words "ultrasonicate for 15 minutes to dissolve bulleyaconitine A...", and calculate the content of $\text{C}_{35}\text{H}_{49}\text{NO}_{10}$.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 3), using 100 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution after exactly 20 minutes and filter. Carry out the procedure described under Assay, inject 20 μ l of the successive filtrate into the column, and record the chromatogram. Dissolve a quantity of bulleyaconitine A CRS, accurately weighed, in mobile phase to produce a solution of about 4 μ g per ml, repeat the operation. Calculate the dissolution of $C_{35}H_{49}NO_{10}$ from each tablet, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 20 tablets. Transfer an accurately weighed quantity of the powder equivalent to about 2 mg of bulleyaconitine A into a 100 ml volumetric flask, add a quantity of mobile phase, ultrasonicate for 15 minutes to dissolve bulleyaconitine A, dilute with mobile phase to volume, shake well. Filter and use the successive filtrate as the test solution. Carry out the Assay as described under Bulleyaconitine A, beginning at the words "inject 20 μ l into the column...", calculate the content of $C_{35}H_{49}NO_{10}$.

Category As described under Bulleyaconitine A.

Strength 0.4 mg

Storage Stored in dry and cool place, protected from light.

Bumetanide

$C_{17}H_{20}N_2O_5S$ 364.42

[28395-03-1]

Bumetanide is 5-butylamino-4-phenoxy-benzonic-3-aminosulfonyl. It contains not less than 98.5% of $C_{17}H_{20}N_2O_5S$, calculated on the dried basis.

Description A white crystal or crystalline powder; odourless; taste, slightly bitter. Soluble in ethanol; slightly soluble in chloroform; insoluble in water.

Melting range 231-235°C (Appendix VI C).

Identification (1) Dissolve 1 mg in 2 ml of dehydrated ethanol, examine under ultraviolet light (365 nm), a violet fluorescence is produced.

(2) To 5 mg add 1 drop of alkaline sodium formate solution (dissolve 5 g of sodium formate and 6 g of sodium hydroxide in 100 ml of water), evaporate the mixture to dryness over a small flame. Heat gently until the residue is charred. Allow to cool and acidify with 0.5 ml of sulfuric acid solution (1→2), add 0.5 ml of water, and filter. To the filtrate add 1 drop of potassium ferricyanide TS, a blue colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bumetanide (Appendix XVI).

Clarity and colour of alkaline solution A solution of 50 mg in

10 ml of potassium hydroxide solution (to 1 ml of potassium hydroxide TS add 9 ml of water) is clear and colourless; any opalescence produced is not more pronounced than that of standard suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution OY₁ (Appendix IX A, method 1).

Chloride To 0.25 g add 25 ml of water, shake thoroughly for 10 minutes and filter, carry out the limit test for chlorides (Appendix VIII A), any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.02%).

Aromatic primary amine Dissolve 40 mg in ethanol in a 10 ml volumetric flask, dilute with ethanol to volume, mix well. Transfer accurately 1 ml to another 10 ml volumetric flask, add 3 ml of hydrochloric acid solution (9→100) and 0.5 ml of 4% sodium nitrite solution, mix well and allow to stand for 2 minutes. Add 1 ml of 10% ammonium sulfamate solution, mix well, allow to stand for 5 minutes. Add 0.5 ml of 2% N-(1-naphthyl)-ethylene-diamine dihydrochloride solution in dilute ethanol, mix well, allow to stand for 2 minutes, dilute with water to volume, mix well. The absorbance of the resulting solution at 518 nm is not greater than 0.19 (Appendix IV B).

Related substances Protected from light throughout the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-glacial acetic acid-cyclohexane-methanol (32:4:4:1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in dehydrated ethanol containing (1) 10 mg per ml and (2) 50 μ g per ml of the substance being examined. After developing and removal of the plate, dry it in a current of air and examine under ultraviolet light (254 nm). No spot other than the principal spot obtained with solution (1) is more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Mix 1.0 g with 1.0 g of calcium hydroxide, add a small quantity of water, dry it in air. Heat gently until it is thoroughly charred, and then ignite at 500-600°C until the incineration is complete. Allow it to cool, dissolve in 8 ml of hydrochloric acid and 20 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.1 g, accurately weighed, in 25 ml of neutralized ethanol (neutral to cresol red IS), add 3-4 drops of cresol red IS. Titrate with sodium hydroxide (0.01 mol/L) VS until a red colour is produced. Each ml of sodium hydroxide (0.01 mol/L) VS is equivalent to 3.644 mg of $C_{17}H_{20}N_2O_5S$.

Category Diuretic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Bumetanide Injection
(2) Bumetanide Tablets

Bumetanide Injection

Bumetanide Injection is a sterile solution of bumetanide and sodium hydroxide in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of bumetanide ($C_{17}H_{20}N_2O_5S$).

Description A clear, colourless liquid.

Identification (1) Examine under ultraviolet light (365 nm), a violet fluorescence is exhibited. (2) To 8 ml add 1 ml of dilute sulfuric acid, a white precipitate is produced, filter and wash the precipitate with water. Dissolve the precipitate in 2 ml of dehydrated ethanol, add 1 ml of 1% potassium iodate solution and 1 ml of potassium iodide TS, a yellow colour is produced.

pH value 6.5-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer accurately 5 ml to a 25 ml volumetric flask, dilute with phosphate BS (pH 7.4) to volume, mix well. Measure the absorbance of the solution at 328 nm (Appendix IV A). Calculate the content of $C_{17}H_{20}N_2O_5S$, taking 98.5 as the value of A (1%, 1 cm).

Category As described under Bumetanide.

Strength 2 ml : 0.5 mg

Storage Preserve in well closed containers, protected from light.

Bumetanide Tablets

Bumetanide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of bumetanide ($C_{17}H_{20}N_2O_5S$).

Description white tablets.

Identification To 10 powdered tablets add 10 ml of dehydrated ethanol, shake to dissolve bumetanide and filter. The filtrate complies with tests (1) and (2) for Identification described under Bumetanide.

Content uniformity Comply with the requirements (Appendix X E). Place 1 tablet in a 25 ml volumetric flask. Carry out the procedure described under Assay, beginning at the words "add a quantity of phosphate BS (pH 7.4)...". Calculate the contents of $C_{17}H_{20}N_2O_5S$.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of phosphate BS (pH 7.8-8.0) as dissolution medium and adjust rotational speed of the basket to 100 rpm. Withdraw 25 ml of the solution after exactly 30 minutes and filter, take the successive filtrate as test solution. Dissolve a quantity of bumetanide CRS in phosphate BS (pH 7.8-8.0) and dilute to produce a solution of 1.2 µg per ml. Measure the fluorescence of two solutions (Appendix X E) at an excitation wavelength at 264 nm and an emission wavelength at 420 nm, calculate the dissolution of $C_{17}H_{20}N_2O_5S$, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 2 mg of bumetanide, to a 50 ml volumetric flask, add a quantity of phosphate BS (pH 7.4), shake for 30 minutes to dissolve bumetanide, dilute with phosphate BS (pH 7.4) to volume. Mix well, filter and measure the absorbance of the successive filtrate at 328 nm (Appendix IV A). Calculate the content of $C_{17}H_{20}N_2O_5S$, taking 98.5 as the value of A (1%, 1 cm).

Category As described under Bumetanide.

Strength 1 mg

Storage Preserve in tightly closed containers, protected from light.

Bupivacaine Hydrochloride

$C_{18}H_{28}N_2O \cdot HCl \cdot H_2O$ 342.91 [14252-80-3]

Bupivacaine Hydrochloride is 1-butyl-N-(2,6-dimethyl-phenyl)-2-piperidinecarboxamide monohydrochloride monohydrate. It contains not less than 98.5% of $C_{18}H_{28}N_2O \cdot HCl$, calculated on the dried basis.

Description A white, crystalline powder; odourless; taste, bitter.

Freely soluble in ethanol; soluble in water; slightly soluble in chloroform; practically insoluble in ether.

Identification (1) Dissolve about 0.15 g in 10 ml of water, add 15 ml of trinitrophenol TS, a yellow precipitate is formed. Filter, wash the precipitate with a small amount of water, then wash with methanol and ether, dry at 105°C, it melt at about 194°C (Appendix VI C).

(2) The light absorption of a solution of about 0.40 mg per ml in 0.01 mol/L hydrochloric acid solution exhibits maxima at 263 nm and 271 nm; the absorbance is about 0.53-0.58 and 0.43-0.48, respectively (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of bupivacaine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.5-6.0 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and 95% ethanol as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 10 mg per ml, (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, visualize with iodine vapour. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses 4.5%-6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%, using 1.0 g

(Appendix VIII N).

Copper Dissolve 0.25 g in 10 ml of water, add 0.25 ml of 0.05 mol/L disodium edetate solution, mix well, and allow to stand for 2 minutes. Add 0.20 g of citric acid, 1.0 ml of ammonia TS and 1.0 ml of sodium diethyldithiocarbamate TS, mix well. Add 5 ml of carbon tetrachloride and shake for 2 minutes. The colour of the carbon tetrachloride layer is not more intense than that of 10 ml of reference solution, obtained by diluting 3.0 ml of copper standard solution (10 µg of Cu per ml) with water to 400 ml and treated in similar manner (0.0003%).

Iron To the residue obtained in the test for Residue on ignition add 2 ml hydrochloric acid, evaporate to dryness on a water bath. Dissolve the residue in 4 ml of dilute hydrochloric acid by heating, add 30 ml of water and 50 mg of ammonium persulfate. Carry out the limit test for iron (Appendix VIII G), the colour produced is not more intense than that of 1.0 ml of iron standard solution treated in a similar manner (0.001%).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 5 drops of naphtholbenzene IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.49 mg of $C_{18}H_{28}N_2O \cdot HCl$.

Category Local anesthetic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Bupivacaine Hydrochloride Injection

Bupivacaine Hydrochloride Injection

Bupivacaine Hydrochloride Injection is a sterile solution of Bupivacaine Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of bupivacaine hydrochloride ($C_{18}H_{28}N_2O \cdot HCl$).

Description A clear, colourless or almost colourless liquid.

Identification (1) A quantity equivalent to about 50 mg of bupivacaine hydrochloride complies with test (1) for Identification described under Bupivacaine Hydrochloride. (2) The light absorption of a solution of 0.4 mg per ml in 0.01 mol/L hydrochloric acid exhibits maxima at 263 nm and 271 nm (Appendix IV A).

pH value 4.0-6.5 (Appendix VI H).

Related substances Evaporate a quantity equivalent to about 20 mg of bupivacaine hydrochloride to dryness on a water bath and cool. Carry out the test for Related substances described under Bupivacaine Hydrochloride, the result complies with the requirement.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Mix thoroughly an accurately measured quantity, equivalent to about 25 mg of bupivacaine hydrochloride with 15 g of chromatographic kieselguhr and 0.5 ml of a 10% sodium hydroxide solution. Transfer the mixture to a sintered glass funnel or a chromatographic tube, extract with 7 quantities, each 20 ml, of gently warm chloroform until the extraction is completed. Transfer the combined extracts to a 250 ml conical flask, evaporate to almost dryness, add

40 ml of glacial acetic acid and 5 drops of naphtholbenzene IS. Titrate with perchloric acid (0.02 mol/L) VS until the solution becomes green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.02 mol/L) VS is equivalent to 6.498 mg of $C_{18}H_{28}N_2O \cdot HCl$.

Category As described under Bupivacaine Hydrochloride.

Strength (1) 5 ml:12.5 mg (2) 5 ml:25 mg
(3) 5 ml:37.5 mg

Storage Preserve in well closed containers, protected from light.

Buprenorphine Hydrochloride

$C_{29}H_{41}NO_4 \cdot HCl$ 504.11

[53152-21-9]

Buprenorphine Hydrochloride is 21-cyclopropyl-7α-[(S)-1-hydroxy-1, 2, 2-trimethylpropyl]-6, 14-endo-ethano-6,7,8,14-tetrahydrooripavine hydrochloride. It contains not less than 99.0% of $C_{29}H_{41}NO_4 \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odourless. Soluble in alcohol; sparingly soluble in chloroform; very slightly soluble in water.

Specific optical rotation -95° to -101° , in a solution of 5 mg per ml in ethanol (Appendix VI E).

Identification (1) Dissolve about 2 mg in 5 ml of water, add a few drops of bromine TS, a yellow precipitate is produced immediately.

(2) The light absorption of the solution of 0.16 mg per ml in water exhibits a maximum at 286 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of buprenorphine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 8 mg in 25 ml of water, pH 5.0-7.0 (Appendix VI H).

Clarity of solution Dissolve about 8 mg in 25 ml of water, the solution is clear.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using a suspension of silica gel G in 0.1 mol/L sodium hydroxide solution to coat the plate and use a mixture of chloroform-methanol (15:1) as the mobile phase. Apply separately to the plate 10 µl of each of two solutions in ethanol containing (1) 10 mg per ml, (2) 0.01 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and expose it to iodine vapour. Any spot other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight in vacuum over phosphorous pentoxide, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve about 0.12 g, accurately weighed, in a mixture of 2 ml of mercuric acetate TS and 30 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.02 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.02 mol/L) VS is equivalent to 10.08 mg of $C_{29}H_{41}NO_4 \cdot HCl$.

Category Analgesic.

Storage Preserve in tightly closed container, protected from light.

Preparation (1) Buprenorphine Hydrochloride Injection
(2) Buprenorphine Hydrochloride Sublingual Tablets

Buprenorphine Hydrochloride Injection

Buprenorphine Hydrochloride Injection is a sterile solution of Buprenorphine Hydrochloride and Glucose in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of buprenorphine hydrochloride ($C_{29}H_{41}NO_4 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) To 1 ml add a few drops of bromine TS, a yellow precipitate is produced.

(2) The light absorption of the injection exhibits a maximum at 286 nm (Appendix IV A).

(3) Acidify 1 ml of the injection with dilute nitric acid and add silver nitrate TS; a white opalescence is formed which is soluble in ammonia TS.

pH value 3.0-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B)

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-2% solution of ammonium acetate-acetic acid (60 : 10 : 40 : 5) as the mobile phase. Detection wavelength is 286 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of buprenorphine hydrochloride.

Procedure Dilute an accurately measured quantity of the injection equivalent to about 0.6 mg of buprenorphine hydrochloride in a 25 ml volumetric flask with mobile phase to volume, mix well. Inject 50 μ l of the resulting solution into the column, record the chromatogram and measure the peak areas. Dissolve 15 mg of buprenorphine hydrochloride CRS, accurately weighed, in methanol in a 50 ml volumetric flask, and dilute to volume, mix well. Transfer 2.0 ml of this solution, accurately weighed, into a 25 ml volumetric flask, dilute with mobile phase to volume and mix well, use the resulting solution as reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{29}H_{41}NO_4 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Buprenorphine Hydrochloride.

Strength (1) 1 ml:0.15 mg (2) 1 ml:0.3 mg

Storage Preserve in well closed container, protected from light.

Buprenorphine Hydrochloride Sublingual Tablets

Buprenorphine Hydrochloride Sublingual Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of buprenorphine hydrochloride ($C_{29}H_{41}NO_4 \cdot HCl$).

Description White tablets.

Identification (1) To 10 powdered tablets add 8 ml of ethanol, shake to dissolve buprenorphine hydrochloride. Filter, evaporate the filtrate to dryness, dissolve the residue in 2 ml of 5% solution of hydrochloric acid, add 1 drop of potassium iodobismuthate TS, a reddish-brown precipitate is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of buprenorphine hydrochloride CRS.

(3) To 10 tablets add 10 ml of water and 1 drop of nitric acid, shake to dissolve, filter. To the filtrate add 2 drops of silver nitrate TS, a white opalescence is produced.

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 powdered tablet with 5 ml (for strength 0.4 mg) or 2 ml (for strength 0.2 mg) water to 25 ml (for strength 0.4 mg) or 10 ml (for strength 0.2 mg) volumetric flask. Add 5 ml methanol to volume, mix well. Proceed as described under the Assay, beginning at the words "ultrasonic for 10 minutes..."

Other requirements Comply with the general requirements for sublingual tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile-2% solution of ammonium acetate-acetic acid (60 : 10 : 40 : 5) as the mobile phase. Detection wavelength is 286 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of buprenorphine hydrochloride.

Procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 0.4 mg of buprenorphine hydrochloride in a 25 ml volumetric flask, add 5 ml of water and 5 ml of methanol. Shake thoroughly and ultrasonic for 10 minutes, dilute with the mobile phase to volume and mix well. Inject 50 μ l of the successive filtrate into the column, record the chromatogram and measure the peak areas. Dissolve 10 mg of buprenorphine hydrochloride CRS, accurately measured, in methanol in a 50 ml volumetric flask and dilute to volume, mix well. Transfer 4.0 ml of this solution, accurately measured, to a 50 ml volumetric flask, dilute with mobile phase to volume and mix well, use the resulting solution as reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{29}H_{41}NO_4 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Buprenorphine Hydrochloride.

Strength (1) 0.2 mg (2) 0.4 mg

Storage Preserve in tightly closed containers, protected from light.

Busulfan

$C_6H_{14}O_6S_2$ 246.29

[55-98-1]

Busulfan is 1,4-butanediol dimethanesulfonate. It contains not less than 98.5% of $C_6H_{14}O_6S_2$, calculated on the dried basis.

Description A white crystalline powder; almost odourless. Soluble in acetone; slightly soluble in water or ethanol.

Melting range 114-118°C (Appendix VI C).

Identification (1) Fuse 0.1 g with 0.1 g of potassium nitrate and 0.25 g of potassium hydroxide and cool. Dissolve it in 5 ml of water, acidify with dilute hydrochloric acid and add a few drops of barium chloride TS; a white precipitate is produced.

(2) Dissolve 0.1 g in 10 ml of water and 5 ml of sodium hydroxide TS by heating; a characteristic odour is perceptible. Cool, to one half of the solution add 1 drop of potassium permanganate TS, the colour of the solution changes from purple to blue, then to emerald-green. Acidify the remainder with dilute sulfuric acid and add 1 drop of potassium permanganate TS, the purple colour is changeless.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of busulfan (Appendix XVI).

Acidity Dissolve 0.20 g in 50 ml of dehydrated ethanol (neutral to methyl red IS) by warming, add 3 drops of methyl red IS and titrate with sodium hydroxide (0.1 mol/L) VS, not more than 0.05 ml is required.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Transfer about 0.2 g, accurately weighed, to a 200 ml conical flask, add 40 ml water, boil gently under reflux for 30 minutes and cool. Add a few drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS equivalent to 12.32 mg of $C_6H_{14}O_6S_2$.

Category Antineoplastic.

Storage Preserve in tightly closed containers.

Preparation Busulfan Tablets

dryness; the residue has a melting range of 113-118°C (Appendix VI C).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Triturate carefully 20 tablets (2 mg) or 80 tablets (0.5 mg) in a mortar. Transfer all powder to a beaker by washing with 20 ml of acetone. Warm and stir, allow to stand, filter the supernatant liquid into a conical flask using a wad of absorbent cotton moistened with acetone. Extract the residue with three 20 ml portions of acetone, filter the extracts into the same conical flask and evaporate the combined filtrates on a water bath to expel. Boil the residue with 30 ml of water under reflux for 30 minutes, cool, add a few drops of phenolphthalein IS, titrate with sodium hydroxide (0.05 mol/L) VS. Each ml of sodium hydroxide (0.05 mol/L) VS is equivalent to 6.158 mg of $C_6H_{14}O_6S_2$.

Category As described under Busulfan.

Strength (1) 0.5 mg (2) 2 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Busulfan Tablets

Busulfan Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of busulfan ($C_6H_{14}O_6S_2$).

Description Sugar-coated tablets with white cores.

Identification To a quantity of the powdered tablets equivalent to about 5 mg of busulfan add 25 ml of acetone, shake to dissolve busulfan, filter and evaporate the filtrate to

Caffeine

$C_8H_{10}N_4O_2 \cdot H_2O$ 212.21

[5743-12-4]

Caffeine is 3,7-dihydro-1,3,7-trimethyl-1*H*-purine-2,6-dione monohydrate. It contains not less than 98.5% of $C_8H_{10}N_4O_2$, calculated on the dried basis.

Description Silky, white or faintly yellowish-green needle crystals; odourless; taste, bitter; efflorescent. Freely soluble in hot water or chloroform; sparingly soluble in water, ethanol or acetone; very slightly soluble in ether.

Melting point 235-238°C (Appendix VI C).

Identification (1) To 10 mg add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, evaporate on a water bath to dryness, the residue reacts with ammonia vapour to produce a purple colour, which disappears on the addition of a few drops of sodium hydroxide TS.

(2) To 5 ml of a saturated water solution add 5 drops of iodine TS, the solution remains clear; add 3 drops of dilute hydrochloric acid to the solution, a brownish-red precipitate is produced which is soluble in a slight excess of sodium hydroxide TS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of caffeine (Appendix XVI).

Clarity of solution Boil 1.0 g in 50 ml of water, allow to cool, the solution is clear.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of *n*-butanol-acetone-chloroform-concentrated ammonia solution (40 : 30 : 30 : 10) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in chloroform-methanol (3 : 2) containing (1) 20 mg per ml and (2) 0.10 mg per ml of the substance being examined. After developing and removal of the plate, allow it to dry in air, examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C to constant weight, loses not more than 8.5% of its weight or not more than 0.5% of the weight of anhydrous caffeine (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 0.5 g in 20 ml of water with heating, cool, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml, filter, if necessary. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.15 g, accurately weighed, in 25 ml of a mixture of acetic anhydride-glacial acetic acid (5 : 1) by gently warming, cool, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellow. Perform a blank determination and make any necessary collection. Each ml of perchloric acid (0.1

mol/L) VS is equivalent to 19.42 mg of $C_8H_{10}N_4O_2$.

Category Central stimulant.

Storage Preserve in tightly closed containers.

Caffeine and Sodium Benzoate Injection

Caffeine and Sodium Benzoate Injection is a sterile solution of anhydrous Caffeine and Sodium Benzoate in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of anhydrous caffeine ($C_8H_{10}N_4O_2$) and sodium benzoate ($C_7H_5NaO_2$).

Description A clear, colourless liquid.

Identification (1) Evaporate 1 ml with 1 ml of hydrochloric acid and 0.1 g of potassium chlorate on a water bath to dryness, the residue reacts with ammonia vapour to produce a purple colour which disappears on the addition of a few drops of sodium hydroxide TS.

(2) Evaporate a quantity to dryness and ignite, the residue yields the flame reaction of sodium salts (Appendix III).

(3) Yields the reactions characteristic of benzoates (Appendix III).

pH value 7.5-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately 5 ml into a 50 ml volumetric flask, dilute with water to volume and mix well, carry out the assay as follows.

Caffeine Measure accurately 10 ml of the above solution into a 100 ml volumetric flask, add 20 ml of water and 10 ml of dilute sulfuric acid, add accurately 50 ml of iodine (0.05 mol/L) VS, dilute with water to volume and mix well, allow to stand in a dark place for 15 minutes. Filter with a dry filter paper, titrate 50 ml of the successive filtrate, accurately measured, with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 4.855 mg of $C_8H_{10}N_4O_2$.

Sodium benzoate Measure accurately 10 ml of the above solution, add 15 ml of water, 25 ml of ether and 1 drop of methyl orange IS, titrate with hydrochloric acid (0.1 mol/L) VS with constant-shaking until the reddish-orange colour in the aqueous layer persists. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 14.41 mg of $C_7H_5NaO_2$.

Category Central stimulant.

Strength (1) 1 ml : 0.12 g anhydrous caffeine and 0.13 g sodium benzoate
(2) 2 ml : 0.24 g anhydrous caffeine and 0.26 g sodium benzoate

Storage Preserve in well closed containers, protected from light.

Calcitonin (Salmon) Injection

Calcitonin (Salmon) Injection is a sterile solution

of Calcitonin (salmon) in Water for Injections. It contains not less than 90.0% and not more than 115.0% of the labelled amount of calcitonin (salmon) ($C_{145}H_{240}N_{44}O_{48}S_2$).

Description A clear, colourless liquid.

Identification The retention time of the principal peak of calcitonin salmon in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of calcitonin (salmon) CRS in the chromatogram of the reference solution.

H value 3.9-4.5 (Appendix VI H).

Related substances In the chromatogram obtained in the Assay the area of any peak corresponding to calcitonin C is not greater than 7% and the sum of the areas of any peaks, other than the principal peak and the peak of calcitonin C is not greater than 5.0% of the total area of all the peaks by the peak area normalisation method.

Undue toxicity Complies with the test for Undue toxicity (Appendix XI C), injected subcutaneously.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.5 EU per μg of the calcitonin (salmon).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel, a mixture of 0.402% tetramethylammonium hydroxide pentahydrate solution-acetonitrile (9 : 1) (adjust the pH to 2.5 with phosphoric acid) as the mobile phase A, and a mixture of 0.363% tetramethylammonium hydroxide pentahydrate solution-acetonitrile (2 : 3) (adjust the pH to 2.5 with phosphoric acid) as the mobile phase B. Perform the gradient elution using the following gradient programme and detection wavelength is 220 nm.

Time(min)	Mobile phase A(%)	Mobile phase B(%)
0	65	35
21	43	57
21.01	65	35
30	65	35

Heat the reference solution at 75°C for 15 hours and cool. Inject 200 μl into the column, the resolution factor between the peaks of calcitonin C (the largest peak to elute after the injection buffer salts and before the principal peak with a relative retention to that of calcitonin (salmon) of between 0.5 and 0.8) and calcitonin (salmon) is more than 3.0.

Procedure Inject 200 μl of the injection being examined into the column and record the chromatogram. Dissolve a quantity of calcitonin (salmon) CRS, accurately weighed, in water to produce a reference solution containing about 10 μg per ml. Repeat the operation, using the reference solution instead of the injection being examined. Calculate the content of $C_{145}H_{240}N_{44}O_{48}S_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Medicine for treating osteoporosis.

Strength 1 ml : 10 μg

Storage Preserve in well closed containers, protected from light and stored at a temperature of 2°C to 8°C.

Calcium Ascorbate

$C_{12}H_{14}CaO_{12} \cdot 2H_2O$ 426.35

Calcium Ascorbate is Calcium salt of L-Ascorbic acid dihydrate. It contains not less than 98.0% of $C_{12}H_{14}CaO_{12} \cdot 2H_2O$.

Description A white to pale yellow crystalline powder; odourless.

Soluble in water, slightly soluble in ethanol, insoluble in ether.

Specific optical rotation +95.0° to +97.0°, in a solution of about 0.10 g per ml in water (Appendix VI E).

Identification (1) To 5 ml of aqueous solution (1→10) add 1 to 2 drops of sodium dichloroindophenol TS, the colour of the solution disappears.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Calcium ascorbate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of calcium salts (Appendix III).

Acidity or alkalinity Dissolve 2.0 g in 20 ml of water, pH value is 6.8-7.4 (Appendix VI H).

Oxalate Dissolve 1.0 g in 10 ml of water, add 2 drops of glacial acetic acid and 5 ml of 10% calcium oxalate solution, allow to stand for 5 minutes, the solution is still clear.

Loss on drying When dried at 105°C for 2 hours, loses not more than 0.1% of its weight (Appendix VIII L), using 3 g.

Residue on ignition Not less than 30.0% and not more than 33.0% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in a quantity of water, add 2 ml of acetate BS (pH 3.5), dilute with water to 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 0.67 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0003%.

Assay Dissolve about 0.2 g, accurately weighed, in 50 ml of water, add 1.5 ml of starch IS. Titrate with iodine (0.05 mol/L) VS until a blue colour persist for at least 30 seconds. Each ml of iodine (0.05 mol/L) VS is equivalent to 10.66 mg of $C_{12}H_{14}CaO_{12} \cdot 2H_2O$.

Category Vitamin.

Storage Preserve in tightly closed vacuum containers, protected from light.

Calcium Disodium Edetate

$\text{C}_{10}\text{H}_{12}\text{CaN}_2\text{Na}_2\text{O}_8 \cdot 6\text{H}_2\text{O}$ 482.38 [23411-34-9]

Calcium Disodium Edetate is disodium [(ethylenedinitrilo) tetraacetato] calciate (2-) hexhydrate. It contains not less than 97.0% and not more than 102.0% of $\text{C}_{10}\text{H}_{12}\text{CaN}_2\text{Na}_2\text{O}_8$, calculated on the anhydrous basis.

Description A white crystalline or granule powder; odourless; tasteless; hygroscopic. Freely soluble in water; insoluble in ethanol or ether.

Identification (1) To 5 ml of water add 2 drops of ammonium thiocyanate TS and 2 drops of ferric chloride TS; a deep red colour is produced and it disappears upon shaking with about 50 mg of calcium disodium edetate. (2) To the aqueous solution (1 → 20) add ammonium oxalate TS; a white precipitate is produced which is soluble in hydrochloric acid but insoluble in acetic acid. (3) Yields the reactions characteristic of sodium salts (Appendix III).

Clarity of solution Dissolve 0.1 g in 50 ml of water, the solution is clear.

Chloride Carry out the limit test for chloride (Appendix VIII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.07%).

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 0.5 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.1%).

Water Not more than 25% (Appendix VIII M, method 1 A).

Iron Ignite 0.1 g until charred, cool. Add 25 ml of water and filter. Carry out the limit test for iron (Appendix VIII G), using the resulting solution. Any colour produced is not more intense than that of a reference solution using 4 ml of iron standard solution (0.04%).

Assay To about 0.6 g, accurately weighed, add 75 ml of water and shake to dissolve. Add 25 ml of dilute acetic acid and 1 ml of diphenylcarbazide IS. Titrate slowly with mercuric nitrate (0.05 mol/L) VS until the solution becomes purple. Perform a blank determination and make any necessary correction. Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 18.72 mg of $\text{C}_{10}\text{H}_{12}\text{CaN}_2\text{Na}_2\text{O}_8$.

Category Heavy metal antidote.

Storage Preserve in tightly closed containers.

Preparation Calcium Disodium Edetate Injection

Calcium Disodium Edetate Injection

Calcium Disodium Edetate Injection is a sterile solution of Calcium Disodium Edetate in Water for

Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of calcium disodium edetate ($\text{C}_{10}\text{H}_{12}\text{CaN}_2\text{Na}_2\text{O}_8$).

Description A clear, colourless liquid.

Identification Complies with the tests for Identification described under Calcium Disodium Edetate.

pH Value 6.5-8.0 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 2 ml per kg of rabbit's weight, injected slowly.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 0.6 g of calcium disodium edetate. Carry out the Assay described under Calcium Disodium Edetate. Each ml of mercuric nitrate (0.05 mol/L) VS is equivalent to 18.72 mg of $\text{C}_{10}\text{H}_{12}\text{CaN}_2\text{Na}_2\text{O}_8$.

Category As described under Calcium Disodium Edetate.

Strength 5 ml : 1 g

Storage Preserve in tightly closed containers, protected from light.

Calcium Carbonate

CaCO_3 100.09 [471-34-1]

Calcium Carbonate contains not less than 98.5% of CaCO_3 , calculated on the dried basis.

Description A white fine crystalline powder; odourless; tasteless.

Practically insoluble in water; insoluble in ethanol; slightly soluble in the water containing ammonium salts or carbon dioxide; soluble in dilute acetic acid, dilute hydrochloric acid or dilute nitric acid with effervescence.

Identification The aqueous solution yields the reactions characteristic of calcium salts and carbonates. (Appendix III)

Acid-insoluble substances Mix 2.0 g with 10 ml of water, add dilute hydrochloric acid dropwise and shake gently until the effervescence is ceased, then add 90 ml of water and filter. Wash the residue with water until the washing shows no chloride. Dry and ignited to constant weight, the residue weighs not more than 0.2% of its weight.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Barium Mix 2.0 g with 10 ml of water, add dilute hydrochloric acid dropwise to dissolve. Dilute with water to 100 ml. Dip a platinum wire in the resulting solution, it does not impart a green colour in a nonluminous flame.

Magnesium and alkali salts Dissolve 1.0 g in 20 ml of water and 10 ml of dilute hydrochloric acid, add 1 drop of methyl red IS, boil. Add ammonia TS dropwise to neutralize, add an excess of ammonium oxalate TS to precipitate the calcium completely. Heat on a water bath for 1 hour and allow to cool. Dilute with water to 100 ml, mix well and filter. To 50 ml of the filtrate add 0.5 ml of sulfuric acid, evaporate to dryness and ignited to constant weight, the residue weighs not more than 1.0% of its weight.

Iron Dissolve 0.12 g in 2 ml of dilute hydrochloric acid and dilute with water to 25 ml, carry out the limit test for iron (Appendix VIII G), Any colour produced is not more intense

than that of a reference solution prepared in the same manner using 5.0 ml of iron standard solution (0.04%).

Heavy metals Mix 0.50 g with 5 ml of water, add 4 ml of dilute hydrochloric acid, boil for 5 minutes and allow to cool. Filter and wash the filter with a small quantity of water. Combine the filtrate and washing, add 1 drop of phenolphthalein IS then add dropwise ammonia TS until the solution becomes light red. Add 2 ml of dilute acetic acid and sufficient water to 25 ml, add 0.5 g of ascorbic acid. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.003%.

Arsenic Dissolve 0.50 g in 6 ml of hydrochloric acid and 22 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0004%.

Assay Dissolve about 1 g, accurately weighed, in a 250 ml volumetric flask, moisten with a small quantity of water, in dilute hydrochloric acid, dilute with water to volume and mix well. Measure accurately 25 ml to a conical flask, add 25 ml of water and 5 ml of potassium hydroxide solution (1→10), adjust the pH value to exceeding 12. Add a small quantity of calcon indicator mixture. Titrate the solution with disodium edetate (0.05 mol/L) VS until the colour turns from purple to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 5.005 mg of CaCO_3 .

Category Calcium replenisher, antacid.

Storage Preserve in tightly closed containers.

Preparation (1) Calcium Carbonate Chewable Tablets
(2) Calcium Carbonate Granules

Calcium Carbonate Chewable Tablets

Calcium Carbonate Chewable Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of calcium (Ca).

Description White or coloured tablets, aromatic.

Identification (1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a brick red colour to a nonluminous flame.

(2) To a quantity of powdered tablets, equivalent to about 0.25 g of calcium, add 15 ml of dilute hydrochloric acid, shake thoroughly and filter. Add 2 drops of methyl red IS to the filtrate, neutralize with ammonia TS, and then acidify with dilute hydrochloric acid. Add ammonium oxalate TS, a white precipitate is formed which is soluble in hydrochloric acid but insoluble in acetic acid.

(3) Add dilute hydrochloric acid to a quantity of powdered tablets, it effervesces with the evolution of carbon dioxide, forming a white precipitate when lead in calcium hydroxide TS immediately.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder, equivalent to about 0.03 g of calcium, to a crucible, heat gently until it is thoroughly charred, and then ignite at 700-800°C for about 2 hours. Cool to room temperature and moisten the residue with a small quantity of water, add 5 ml of dilute hydrochloric acid, heat gently to dissolve the residue, transfer the solution with 70 ml of water in portions to a flask, adjust to pH 5-6 with sodium hydroxide TS. Add 2 ml of tartaric acid solution (1→5), 5 ml of triethanolamine solution (3→100), 15 ml of sodium hydroxide TS and a small quantity of calcon indicator mixture to the solution. Titrate the solution with

disodium edetate (0.05 mol/L) VS until the colour turns from purple to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.004 mg of Ca.

Category Calcium replenisher.

Strength (1) 0.5 g (2) 0.125 g (calculated on Ca)

Storage Preserve in tightly closed containers, stored in a dry place.

Calcium Carbonate Granules

Calcium Carbonate Granules contain not less than 93.0% and not more than 107.0% of the labelled amount of calcium (Ca).

Description White or coloured granules.

Identification (1) Moisten the substance being examined with hydrochloric acid on a platinum wire, it imparts a brick red colour to a nonluminous flame.

(2) To a quantity of powdered granules, equivalent to about 0.25 g of calcium, add 15 ml of dilute hydrochloric acid, shake thoroughly and filter. Add 2 drops of methyl red IS to the filtrate, neutralize with ammonia TS, and then acidify with dilute hydrochloric acid. Add ammonium oxalate TS, a white precipitate is produced which is soluble in hydrochloric acid but insoluble in acetic acid.

(3) Add dilute hydrochloric acid to a quantity of granules, it effervesces with the evolution of carbon dioxide, producing a white precipitate when lead in calcium hydroxide TS immediately.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N) except Loss on drying and Dispersion.

Assay Weigh accurately a quantity of the mixed contents equivalent to about 0.03 g of calcium obtained under the test for weight variation of contents. to a crucible, heat gently until it is thoroughly charred, and then ignite at 700-800°C for about 2 hours. Cool to room temperature and moisten the residue with a small quantity of water, add 5 ml of dilute hydrochloric acid, heat gently to dissolve the residue, transfer the solution with 70 ml of water in portions to a flask, adjust to pH 5-6 with sodium hydroxide TS. Add 2 ml of tartaric acid solution (1→5), 5 ml of triethanolamine solution (3→100), 15 ml of sodium hydroxide TS and a small quantity of calcon indicator mixture to the solution. Titrate the solution with disodium edetate (0.05 mol/L) VS until the colour changes from purple to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.004 mg of Ca.

Category Calcium replenisher.

Strength 0.25 g (calculated on Ca)

Storage Preserve in tightly closed containers, stored in a dry place.

Calcium Chloride

$\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$ 147.02

[10035-04-8]

Calcium Chloride contains not less than 97.0% and not more than 103.0% of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Description White, hard solids or granules; odourless; taste, slightly bitter; very hygroscopic. Very soluble in water; freely soluble in ethanol.

Identification The aqueous solution yields the reactions characteristic of calcium salts (Appendix III) and chlorides (Appendix III).

Acidity or alkalinity Dissolve 3.0 g in 20 ml of water, add 2 drops of phenolphthalein IS. If the solution is pink, the colour is discharged on adding 0.30 ml of hydrochloric acid (0.02 mol/L) VS. If the solution is colourless, it produces pink by adding 0.10 ml of sodium hydroxide (0.02 mol/L) VS.

Clarity of solution A solution of 1.0 g in 10 ml of water is clear. Any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.02%).

Barium Dissolve 2.0 g in 20 ml of water and filter. Divide the filtrate into 2 equal parts. To one part add 5 ml of freshly prepared calcium sulfate TS, to the other part add 5 ml of water, allow to stand for 1 hour. The solutions are equal in clarity.

Aluminium, Iron and Phosphate Dissolve 1.0 g in 20 ml of water, add 2 drops of dilute hydrochloric acid and 1 drop of phenolphthalein IS. Add dropwise ammoniated ammonium chloride TS until a pink colour is produced. No turbidity or precipitate is produced when boiling.

Magnesium and Alkali metals Dissolve 1.0 g in 40 ml of water, add 0.5 g of ammonium chloride and heat the solution to boil. Add an excess of ammonium oxalate TS to precipitate calcium completely and heat on a water bath for 1 hour. Cool to room temperature, dilute with water to 100 ml, stir well and filter. To 50 ml of the filtrate add 0.5 ml of sulfuric acid, evaporate to dryness and ignite to constant weight. The residue does not exceed 5 mg.

Heavy metals Dissolve 2.0 g in 2 ml of acetate BS (pH 3.5) and a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0002%.

Assay Add 10 ml of water to a weighing bottle and weigh accurately. Add about 1.5 g of the substance being examined and weigh again accurately. Transfer the solution to a 100 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 10 ml of the solution to a conical flask, add 90 ml of water, 15 ml of sodium hydroxide TS and about 0.1 g of calcon indicator mixture, titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purplish-red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 7.351 mg of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Category Calcium replenisher.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Calcium Chloride Injection

Calcium Chloride Injection

Calcium Chloride Injection is a sterile solution of Calcium Chloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of calcium chloride ($\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$).

Description A clear, colourless liquid.

Identification Yields the reactions characteristic of calcium salts and chlorides (Appendix III).

pH value 4.5-6.5 (Appendix VI H).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.2 Eu per ml.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to 0.15 g of calcium chloride into a conical flask, add a quantity of water to produce 10 ml. Carry out the Assay described under calcium chloride, beginning at the words "add 90 ml of water". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 7.351 mg of $\text{CaCl}_2 \cdot 2\text{H}_2\text{O}$.

Category As described under Calcium Chloride.

Strength (1) 10 ml : 0.3 g (2) 10 ml : 0.5 g
(3) 20 ml : 0.6 g (4) 20 ml : 1 g

Storage Preserve in well closed containers.

Calcium Folate

$\text{C}_{20}\text{H}_{21}\text{CaN}_7\text{O}_7 \cdot 5\text{H}_2\text{O}$ 601.61

[1492-18-8]

Calcium Folate is calcium *N*-[*p*-[[[(6*RS*)-2-amino-5-formyl-5,6,7,8-tetrahydro-4-hydroxy-6-pteridyl] methyl] amino] benzoyl]-*L*-glutamate, pentahydrate. It contains not less than 95.0% and not more than 105.0% of $\text{C}_{20}\text{H}_{21}\text{CaN}_7\text{O}_7$, calculated on the anhydrous basis.

Description Almost white to slightly yellow crystals or an amorphous powder; odourless. Soluble in water, practically insoluble in ethanol or ether; freely soluble in 0.1 mol/L sodium hydroxide solution.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of calcium folinate CRS.

(2) The light absorption of the solution of 10 μg per ml in 0.1 mol/L sodium hydroxide solution exhibits a maximum at 282 nm and a minimum at 241 nm (Appendix IV A).

(3) The aqueous solution yields the reactions characteristic of calcium salts (Appendix III).

Related substances Dissolve a quantity of the substance being examined in water to produce solutions of 1 mg per ml (solution 1) and 10 µg per ml (solution 2). Carry out the method as described under the Assay. Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of the full scale of the chart. Inject separately 20 µl of above two solutions, and record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) is not greater than 2.5 times of area of the principal peak in the chromatogram obtained with solution (2).

Water Not more than 16.0% (Appendix VIII M, method 1 A).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 0.40 g; not more than 0.005%.

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture as the mobile phase prepared as follows: mix 220 ml of methanol and 780 ml of a solution containing 8.0 ml of 10% tetrabutylammonium hydroxide solution and 2.2 g of disodium hydrogen phosphate previously adjusted to pH 7.8 with phosphoric acid. Detection wavelength is 280 nm and the column is maintained at 40°C. The number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of calcium folinate.

Dissolve an accurately weighed quantity in water to produce a solution of about 0.1 mg per ml. Inject 10 µl of solution into the column. Repeat the operation, using calcium folinate CRS instead of the substance being examined, calculate the content of $C_{20}H_{21}CaN_7O_7$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antidote, Antianemic.

Storage Preserve in hermetically sealed containers, protected from light and stored in a cool place.

Preparation (1) Calcium Folate Capsules
(2) Calcium Folate for Injection
(3) Calcium Folate Tablets

Calcium Folate Capsules

Calcium Folate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of folic acid ($C_{20}H_{23}N_7O_7$).

Description Capsules containing almost white to yellow granules or powder.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of calcium folinate CRS.

(2) Weigh a quantity of the contents of the capsules with 0.1 mol/L sodium hydroxide solution to produce a solution of about 10 µg per ml, filter. The light absorption of the filtrate exhibits a maximum at 282 nm, and minimum at 241 nm. (Appendix IV A).

(3) Weigh a quantity of the contents of the capsules, equivalent to about 15 mg of folic acid, with 4 ml of water to dissolve calcium folinate, shake and filter. The filtrate yields the reactions characteristic of calcium salts (Appendix III).

Related substances Carry out the method as described under Assay. Weigh a quantity of the contents of the capsules with water to produce a solution of 1 mg per ml and filter, using the successive filtrate as the test solution. Dilute the filtrate, accurately measured, with water to produce a solution of 10 µg per ml as the reference solution. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all the peaks other than the principal peak are not greater than 2.5 times of area of the principal peak in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 30 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with 0.2 mol/L sodium hydroxide solution to produce a solution of 10 µg of folic acid per ml. Measure the absorbance of the resulting solution at 282 nm (Appendix IV A). Calculate the dissolution of $C_{20}H_{21}CaN_7O_7$ from each capsule, taking 575 as the value of A (1%, 1 cm) and multiply the result by 0.9256. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Triturate the mixed contents obtained under the test for weight variation of contents. Weigh accurately a quantity of the powder equivalent to about 20 mg of folic acid into a 200 ml volumetric flask, add a quantity of water and shake to dissolve calcium folinate, dilute with water to volume, shake thoroughly and filter. Measure accurately a quantity of the successive filtrate and carry out the Assay as described under Calcium Folate, and multiply the result by 0.9256.

Category As described under Calcium Folate.

Strength 25 mg (calculated as folic acid)

Storage Preserve in tightly closed containers, protected from light.

Calcium Folate for Injection

Calcium Folate for Injection is a sterile lyophilized preparation of calcium folinate. It contains not less than 85.0% and not more than 115.0% of the labelled amount of folic acid ($C_{20}H_{23}N_7O_7$).

Description An almost white to yellow friable mass or powder.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of calcium folinate CRS.

(2) The light absorption of the solution of 10 µg per ml in 0.1 mol/L sodium hydroxide solution exhibits a maximum at 282 nm and a minimum at 241 nm (Appendix IV A).

(3) Dissolve a quantity equivalent to about 15 mg of folic acid in 4 ml of water with shaking, filter, the filtrate yields the reactions characteristic of calcium salts (Appendix III).

Acidity or alkalinity An aqueous solution of 1 mg per ml, pH 6.5-8.5 (Appendix VI H).

Content uniformity Complies with the requirements for content uniformity (Appendix X E). Dissolve the content of one container in 0.1 mol/L sodium hydroxide solution to produce a solution of 10 µg per ml (for strength 3 mg or 5 mg). Measure the absorbance of the solution at 282 nm (Appendix IV A), calculate the content of $C_{20}H_{21}CaN_7O_7$, taking 575 as the value of A (1%, 1 cm), and multiply the result by 0.9256.

Related substances Dissolve a quantity of the content in water to produce a solution of about 1 mg per ml (solution 1), measure accurately 1 ml, dilute with water to 100 ml volumetric flask and mix well (solution 2). Carry out the method described under the Assay. Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of the full scale of the chart. Inject separately 20 µl of above two solutions, and record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2).

Water Not more than 16.0% (Appendix VIII M, method 1 A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 2 ml of a solution of 5.6 mg per ml in Sodium Chloride Injection per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve contents of 10 containers (for strength 3 mg or 5 mg) or 5 containers (for strength 25 mg, 30 mg, 50 mg or 100 mg) in water to produce a solution of 0.1 mg per ml. Carry out the Assay described under Calcium Folate, and multiply the result by 0.9256.

Category As described under Calcium Folate.

Strength (1) 3 mg (2) 5 mg (3) 15 mg (4) 25 mg (5) 30 mg (6) 50 mg (7) 100 mg (Calculated as folic acid)

Storage Preserve in well closed containers, protected from light.

Calcium Folate Tablets

Calcium Folate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of folic acid ($C_{20}H_{23}N_7O_7$).

Description almost white to yellow tablets.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of calcium folinate CRS.

(2) Weigh a quantity of the powdered tablets with 0.1 mol/L sodium hydroxide solution to produce a solution of about 10 µg per ml, filter. The light absorption of the filtrate exhibits a maximum at 282 nm, and a minimum at 241 nm (Appendix IV A).

(3) Weigh a quantity of the powdered tablets, equivalent to about 15 mg of folic acid, with 4 ml of water to dissolve, filter. The filtrate yields the reaction characteristic of calcium salts (Appendix III).

Related substances Carry out the method described under Assay. Weigh a quantity of finely powdered tablets with water to produce a solution of 1 mg per ml and filter, using

the successive filtrate as the test solution. Dilute the filtrate, accurately measured, with water to produce a solution of 10 µg per ml as the reference solution. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution into the column, and record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak is not greater than 2.5 times of area of the principal peak in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 30 minutes and filter. Dilute a quantity of the successive filtrate with 0.2 mol/L sodium hydroxide solution to produce a solution of 10 µg of folic acid per ml. Measure the absorbance of the resulting solution at 282 nm (Appendix IV A). Calculate the dissolution of $C_{20}H_{21}CaN_7O_7$ from each tablet, taking 575 as the value of A (1%, 1 cm), and multiply the result by 0.9256. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 20 mg of folic acid into a 200 ml volumetric flask, add a quantity of water and shake to dissolve calcium folinate, dilute with water to volume, shake thoroughly and filter. Measure accurately a quantity of the successive filtrate and carry out the Assay as described under calcium folinate, and multiply the result by 0.9256.

Category As described under Calcium Folate.

Strength (1) 15 mg (2) 25 mg (calculated as folic acid)

Storage Preserve in tightly closed containers, protected from light.

Calcium Gluconate

$C_{12}H_{22}CaO_{14} \cdot H_2O$ 448.40

[12569-38-9]

Calcium Gluconate is the calcium salt of D-Gluconic acid, monohydrate. It contains not less than 99.0% and not more than 104.0% of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

Description A white granular powder; odourless; tasteless. Freely soluble in boiling water; slowly soluble in water; insoluble in dehydrated ethanol, chloroform or ether.

Identification (1) Dissolve about 0.5 g in 5 ml of water by warming, add 0.7 ml of glacial acetic acid and 1 ml of freshly distilled phenylhydrazine, heat on a water bath for 30 minutes and cool to room temperature. Scratch the inner surface of the test tube with a glass rod, yellow crystals are formed gradually.

(2) Dissolve about 0.1 g in 5 ml of water, add 1 drop of ferric chloride TS; an intense yellow colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of calcium gluconate (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of calcium salts (Appendix III).

Clarity of solution Boil 4.0 g with 40 ml of water; a clear solution is obtained (for injection).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.05%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 of potassium sulfate standard solution (0.1%).

Sucrose or reducing sugars Dissolve 0.50 g in 10 ml of hot water, add 2 ml of dilute hydrochloric acid, boil for 2 minutes and cool to room temperature. Add 5 ml of sodium carbonate TS, allow to stand for 5 minutes, dilute with water to 20 ml and filter. To 5 ml of the filtrate, add 2 ml of alkaline cupric tartrate TS, and boil for 1 minute; no red precipitate is produced immediately.

Magnesium and alkali metals Dissolve 1.0 g in 40 ml of water, add 0.5 g of ammonium chloride, boil, add an excess of ammonium oxalate TS to precipitate the calcium salt completely. Heat on a water bath for 1 hour and cool to room temperature. Dilute with water to 100 ml, mix well and filter. To 50 ml of the filtrate, add 0.5 ml of sulfuric acid, evaporate to dryness and ignite to constant weight, the residue weighs not more than 5 mg.

Heavy metals Dissolve 1.0 g in 2 ml of 1 mol/L hydrochloric acid solution and sufficient water to produce 25 ml by warming. Cool to room temperature, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.0015%.

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 23 ml of water, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve 0.5 g, accurately weighed, in 100 ml of water by warming, add 15 ml of sodium hydroxide TS, and 0.1 g of calcon indicator mixture. Titrate the solution with disodium edetate (0.05 mol/L) VS until the colour changes from violet to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

Category Calcium replenisher.

Storage Preserve in tightly closed containers.

Preparation (1) Calcium Gluconate Buccal Tablets
(2) Calcium Gluconate Injection
(3) Calcium Gluconate Oral Solution
(4) Calcium Gluconate Tablets

Calcium Gluconate Buccal Tablets

Calcium Gluconate Buccal Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of calcium gluconate ($C_{12}H_{22}CaO_{14} \cdot H_2O$).

Description White or coloured tablets; odour, aromatic;

taste, sweet.

Identification To a quantity of the powdered tablets, equivalent to about 1 g of calcium gluconate, add 10 ml of warm water, shake and filter. The filtrate complies with the tests (1), (2) and (4) for Identification described under Calcium Gluconate.

Other requirements Comply with the general requirements for tablets (Appendix I A), except the disintegration test.

Assay Carry out the assay described under Calcium Gluconate Tablets.

Category As described under Calcium Gluconate.

Strength (1) 0.1 g (2) 0.15 g (3) 0.2 g

Storage Preserve in tightly closed containers, stored in dry place.

Calcium Gluconate Injection

Calcium Gluconate Injection is a sterile solution of Calcium Gluconate in Water for Injection. It contains not less than 97.0% and not more than 107.0% of the labelled amount of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

Calcium salt or other suitable substance may be added as a stabilizing agent. But the amount of Ca added does not exceed 5% of that equivalent to the content of calcium gluconate.

Description A clear, colourless liquid.

Identification Complies with the tests (1), (2) and (4) for Identification described under Calcium Gluconate.

pH value 4.0-7.5 (Appendix VI H).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 2 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a volume equivalent to 0.5 g of calcium gluconate to a conical flask, add water to produce 100 ml. Carry out the Assay described under Calcium Gluconate, beginning at the words "add 15 ml of sodium hydroxide TS...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

Category As described under Calcium Gluconate.

Strength (1) 10 ml : 0.5 g (2) 10 ml : 1 g

Storage Preserve in well closed containers.

Calcium Gluconate Oral Solution

Calcium Gluconate Oral Solution contains not less than 9.00% and not more than 10.50% (g/ml) of the labelled amount of calcium gluconate ($C_{12}H_{22}CaO_{14} \cdot H_2O$).

Description A colourless to pale yellow liquid or viscous liquid with aromatic odour; taste, sweet.

Identification Complies with the tests (1), (2) and (4) for Identification described under Calcium Gluconate.

Clarity of solution Dilute 10 ml with water to 50 ml, the

solution is clear.

Relative density 1.10 to 1.15 (Appendix VI A) (That without saccharide need not check this item).

pH value 4.0-7.5 (Appendix VI H).

Other requirements Complies with the general requirements for oral solutions (Appendix I O).

Assay Measure accurately 5.0 ml to a conical flask, dilute with water to 100 ml. Add 15 ml of sodium hydroxide TS, and 0.1 g of calcon indicator mixture. Titrate with disodium edetate (0.05 mol/L) VS until the colour changes from violet to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

Category As described under Calcium Gluconate.

Strength 10%

Storage Preserve in tightly closed containers.

Calcium Gluconate Tablets

Calcium Gluconate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of calcium gluconate ($C_{12}H_{22}CaO_{14} \cdot H_2O$).

Description White tablets.

Identification Shake a quantity of the powdered tablets equivalent to 1 g of calcium gluconate with 10 ml of warm water and filter. The filtrate complies with the tests (1), (2) and (4) for Identification described under Calcium Gluconate.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution at 45 minutes and filter, using the successive filtrate (for 0.1 g per tablet) or dilute 2 ml of the successive filtrate, accurately measured, into a 10 ml volumetric flask and dilute with water to volume, mix well (for 0.5 g per tablet) as the test solution. Carry out the method for atomic absorption spectrophotometry (Appendix IV D, method 1), measure the absorbance of the test solution at 422.7 nm. Dissolve a quantity of calcium gluconate CRS, accurately weighed, in water to produce a solution of about 0.1 mg per ml. Repeat the operation using calcium gluconate CRS instead of the substance being examined. Calculate the dissolution of $C_{12}H_{22}CaO_{14} \cdot H_2O$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 1 g of calcium gluconate, dissolve in about 50 ml of water by warming. Cool to room temperature, transfer to a 100 ml volumetric flask, dilute with water to volume and mix well and filter. Measure accurately 25 ml of the successive filtrate and add 75 ml of water. Complete the Assay described under Calcium Gluconate, beginning at the words "add 15 ml of sodium hydroxide TS...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 22.42 mg of $C_{12}H_{22}CaO_{14} \cdot H_2O$.

Category As described under Calcium Gluconate.

Strength (1) 0.1 g (2) 0.5 g

Storage Preserve in tightly closed containers.

Calcium Hydrogen Phosphate

$CaHPO_4 \cdot 2H_2O$ 172.09

[7789-77-7]

Calcium Hydrogen Phosphate contains not less than 98.0% and not more than 105.0% of $CaHPO_4 \cdot 2H_2O$.

Description A white powder; odourless; tasteless. Insoluble in water or ethanol; freely soluble in dilute hydrochloric acid or dilute nitric acid.

Identification The acidic aqueous solution yields the reactions characteristic of calcium salts and phosphates (Appendix III).

Fluorides Place 2.0 g together with 5 ml of perchloric acid, 15 ml of water and a few glass beads in a 50 ml volumetric distilling flask connected with a condenser. The flask is also equipped with a stopper with 2 holes. Insert a thermometer and a dropping funnel, filled with water and connected to a capillary tube through each hole, both of which extend into the liquid surface, heat until the temperature reaches 135°C with a small flame, receiving the distillate under the surface of 10 ml of water, and then maintain at 135°C to 140°C by adding water in dropwise from the funnel. Continue the distillation until 70 ml of the distillate has been collected. Rinse the condenser with water, and dilute the distillate to 100 ml, mix well and use 50 ml of the solution as the test solution. Dilute 15 ml of sodium fluoride standard solution [dissolve 0.2210 g, accurately weighed, of sodium fluoride dried previously to constant weight at 105°C, with water in a 100 ml volumetric flask and dilute with water to volume, mix well; measure accurately 10 ml to a 1000 ml volumetric flask, dilute with water to volume and mix well before use. Each ml of the standard solution contains 10 µg of fluorine (F)], with water to 50 ml, use as standard solution. Add 1.5 ml of sodium alizarinsulfonate IS to the test solution and the standard solution, and add sodium hydroxide (0.05 mol/L) VS dropwise until the solutions become faintly pink. Then add to each solution 5 ml of hydrochloric acid (0.02 mol/L) VS. Titrate with a 0.025% solution of thorium nitrate to pink colour. The titration volume (ml) consumed for the test solution is not more than that for the standard solution (0.015%).

Chlorides Dissolve 0.20 g in 10 ml of water and 2 ml of nitric acid with gentle heating, cool, carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 10.0 ml of sodium chloride standard solution (0.05%).

Sulfates Dissolve 1.0 g in a quantity of dilute hydrochloric acid, dilute with water to 100 ml, mix well and filter. To 20 ml of the filtrate add 5 ml of water, carry out the limit test for sulfates (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference using 4 ml of potassium sulfate standard solution (0.2%).

Carbonates Mix 1.0 g with 5 ml of water and add 2 ml of hydrochloric acid, no effervescence is produced.

Insoluble substances in hydrochloric acid Heat to dissolve 5.0 g in a mixture of 10 ml of hydrochloric acid and 40 ml of water and dilute with water to 100 ml. Filter and wash any residue with water until the washing does not give a reaction for chloride, and dry the residue at 105°C for 1 hour. The weight of the residue does not exceed 5 mg.

Loss on ignition Ignite it at 600°C to constant weight, loses

24.5%-26.5% of its weight, using 1.0 g.

Barium Heat 0.50 g with 10 ml of water and add hydrochloric acid dropwise with stirring until no more dissolves. Filter and to the filtrate add 2 ml of potassium sulfate TS, no turbidity is produced within 10 minutes.

Heavy metals Dissolve 1.0 g in 3 ml of dilute hydrochloric acid with heating, dilute with water to 50 ml and filter. Carry out the limit test for heavy metals (Appendix VIII H, method 1) with 25 ml of filtrate; not more than 0.003%.

Arsenic Dissolve 0.50 g in 5 ml of hydrochloric acid (1→25) solution. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.001%.

Assay Dissolve 0.6 g, accurately weighed, in 10 ml of dilute hydrochloric acid with heating, cool, transfer to a 100 ml volumetric flask, dilute with water to volume and mix well. To 10 ml of the solution, accurately measured, add 50 ml of water, adjusted to neutral by ammonia test solution, and 25 ml, accurately measured, of disodium edetate (0.05 mol/L) VS, heat for a few minutes. Allow it to cool, add 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a small amount of eriochrome black T indicator mixture. Titrate with zinc (0.05 mol/L) VS until the solution turns to reddish-violet. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 8.605 mg of $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$.

Category Calcium replenisher.

Storage Preserve in tightly closed containers.

Preparation calcium Hydrogen Phosphate Tablets

Calcium Hydrogen Phosphate Tablets

Calcium Hydrogen Phosphate Tablets contain not less than 92.5% and not more than 107.5% of the labelled amount of calcium hydrogen phosphate ($\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets, equivalent to about 1 g of calcium hydrogen phosphate, with 5 ml of dilute hydrochloric acid and 10 ml of water by heating, cool and filter. The filtrate yields the reactions characteristic of phosphates and calcium salts (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A), except disintegration test.

Assay Weigh and powder 20 tablets. Dissolve a quantity equivalent to about 0.6 g of calcium hydrogen phosphate, accurately weighed, in 10 ml of dilute hydrochloric acid by heating. Cool, transfer to a 100 ml volumetric flask, dilute with water to volume and mix well and filter. Measure accurately 10 ml of the successive filtrate, add 50 ml of water, adjusted to neutral by ammonia test solution, and 25 ml of disodium edetate (0.05 mol/L) VS, heat for a few minutes. Cool, add 10 ml of ammonia-ammonium chloride BS (pH 10.0) and a few drops of eriochrome black T indicator mixture, titrate with zinc (0.05 mol/L) VS until the solution turns to purplish red. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 8.605 mg of $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$.

Category As described under Calcium Hydrogen Phosphate.

Strength 0.3 g

Storage Preserve in tightly closed containers.

Calcium Lactate

$\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$ 308.30 [41372-22-9]

Calcium Lactate is 2-hydroxy-propanoic acid, calcium salt (2 : 1) pentahydrate. It contains not less than 98.0% and not more than 103.0% of $\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$.

Description A white or almost white crystalline or granular powder; almost odourless; slightly efflorescent. Freely soluble in hot water; soluble in water; practically insoluble in ethanol, chloroform or ether.

Identification (1) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of calcium lactate (Appendix XVI).

(2) The aqueous solution yields the reactions characteristic of calcium salts and lactates (Appendix III).

Acidity Dissolve 1.0 g in 20 ml of freshly boiled warm water, allow to cool to room temperature, add 2 drops of phenolphthalein IS, not more than 0.50 ml of sodium hydroxide (0.1 mol/L) VS is required to change the colour of the solution to pink.

Chlorides Carry out the limit test for chlorides (Appendix VIII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.05%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 0.40 g. Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of potassium sulfate standard solution (0.075%).

Bariums Dissolve 1.0 g in 20 ml of water, divide the solution into two equal parts, use one of them as the reference solution; to the other one add 1 ml of calcium sulfate TS, allow to stand for 15 minutes. Any opalescence produced is not more pronounced than that of the reference solution.

Iron Dissolve 0.50 g in 25 ml of water by heating in a water bath, allow to cool to room temperature. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference using 2.5 ml of iron standard solution (0.005%).

Heavy metals Heat gently to dissolve 1.0 g in 15 ml of water and 2 ml of acetate BS (pH 3.5), allow to cool to room temperature, add a quantity of water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Weigh accurately about 0.3 g, heat to dissolve in 100 ml of water, allow to cool to room temperature, add 15 ml of sodium hydroxide TS and about 0.1 g of calcon indicator mixture. Titrate with disodium edetate (0.05 mol/L) VS until the colour changes from purple red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 15.42 mg of $\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$.

Category Calcium replenisher.

Storage Preserve in tightly closed containers.

Preparation Calcium Lactate Tablets

Calcium Lactate Tablets

Calcium Lactate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of calcium lactate ($\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$).

Description White tablets.

Identification Dissolve a quantity of the powdered tablets equivalent to 1 g of calcium lactate in 20 ml of water with heating, filter, the filtrate yields the reactions characteristic of calcium salts and lactates (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A), but the disintegration time is not more than 20 minutes.

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of the powder equivalent to about 0.3 g of calcium lactate in 100 ml of water with heating, allow to cool to room temperature, carry out the Assay described under Calcium Lactate, beginning at the words "add 15 ml of sodium hydroxide TS...". Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 15.42 mg of $\text{C}_6\text{H}_{10}\text{CaO}_6 \cdot 5\text{H}_2\text{O}$.

Category As described under Calcium Lactate.

Strength (1) 0.25 g (2) 0.3 g (3) 0.5 g

Storage Preserve in tightly closed containers.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of calcium pantothenate (Appendix XV).

(4) The aqueous solution yields the reactions characteristic of calcium salts (Appendix III).

Clarity and colour of solution Dissolve 1.0 g in 20 ml of water, the resulting solution is clear and colourless.

Loss on drying When dried to constant weight at 105°C, loses not more than 5.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in a quantity of water, add 1.0 ml of hydrochloric acid solution (9→100), add water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Calcium Dissolve about 0.5 g, accurately weighed, in 100 ml of water, add 15 ml of sodium hydroxide TS and 0.1 g of calcon indicator mixture. Titrate with disodium edetate (0.05 mol/L) VS until the solution colour changes from purple red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.004 mg of Ca.

Nitrogen Weigh accurately about 0.5 g, carry out the determination of nitrogen (Appendix VII D, method 1). Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 1.401 mg of N.

Category Vitamin.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Calcium Pantothenate Tablets

Calcium Pantothenate Tablets

Calcium Pantothenate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of calcium pantothenate ($\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$).

Description White tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 50 mg of calcium pantothenate add 5 ml of sodium hydroxide TS, shake and filter, to the filtrate add 1 drop of cupric sulfate TS, a deep blue colour is produced.

(2) To a quantity of powdered tablets equivalent to about 50 mg of calcium pantothenate add 5 ml of sodium hydroxide TS, heat to boil for 1 minute and allow to cool to room temperature. Add 5 ml of 1 mol/L hydrochloric acid solution and 2 drops of ferric chloride TS, a yellow colour is produced.

(3) Shake a quantity of powdered tablets with water and filter, the filtrate yields the reactions characteristic of calcium salts (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 150 tablets. Triturate an accurately weighed quantity of the powder equivalent to about 0.3 g of calcium pantothenate, add 25 ml of water, shake vigorously to dissolve the calcium pantothenate, filter and wash with 20 ml of water each for 5 times, combine the washings and filtrate, add 10 ml of ammonia-ammonium chloride BS, add 1 drop of dilute magnesium sulfate TS and a small amount of eriochrome black T indicator mixture, titrate with disodium edetate (0.05 mol/L) VS, until the colour changes from purple red to pure blue. Perform a blank determination and make any necessary correction. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 23.83 mg of $\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$.

Calcium Pantothenate

$\text{C}_{18}\text{H}_{32}\text{CaN}_2\text{O}_{10}$ 476.54

[135-08-6]

Calcium Pantothenate is (*R*)-*N*-(2,4-dihydroxy-3,3-dimethyl-1-oxobutyl)-3-alanine, calcium salt (2 : 1). It contains 8.20%-8.60% of calcium (Ca) and 5.70%-6.00% of nitrogen (N), calculated on the dried basis.

Description A white powder; odourless; taste, slightly bitter; hygroscopic. The aqueous solution yields a neutral or weakly alkaline reaction. Freely soluble in water; very slightly soluble in ethanol; practically insoluble in chloroform or ether.

Specific optical rotation +25° to +28.5°, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) Shake about 50 mg with 5 ml of sodium hydroxide TS, add 2 drops of cupric sulfate TS; a bluish-violet colour is produced.

(2) Shake about 50 mg with 5 ml of sodium hydroxide TS, boil for 1 minute and cool to room temperature. Add 1 drop of phenolphthalein IS, then add dropwise hydrochloric acid solution (9→100) until the pink colour disappears, add further 0.5 ml of hydrochloric acid solution (9→100) and 2 drops of ferric chloride TS; a bright yellow colour is produced.

Category As described under Calcium Pantothenate.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Camphor

$C_{10}H_{16}O$ 152.24

[76-22-2]

Camphor is 1,7,7-trimethyl-bicycol [2.2.1] heptane-2-one. It is extracted from *Cinnamomum camphora* (L.) Nees and Eberm (natural camphor) or prepared by chemical synthesis (synthetic camphor).

Description A white crystalline powder or colourless translucent crumbly mass. Readily pulverized in the presence of a little ethanol, chloroform or ether; odour, characteristic, hot at first, then cool and refreshing; volatilized easily at room temperature; burns with black smoke and a bright flame.

Very soluble in chloroform; freely soluble in ethanol, ether, fatty oil or volatile oil; very slightly soluble in water.

Melting range Transfer a quantity to a thin-walled capillary tube, 2.0-2.5 mm in diameter, sealed at one end. Carry out the determination of melting point (Appendix VI C); Natural camphor melts at 176-181°C; synthetic camphor melts at 174-179°C.

Specific optical rotation +41° to +44° (natural) or -1.5° to +1.5° (synthetic), in a solution of 0.1 g per ml in ethanol (Appendix VI E).

Identification (1) Dissolve a quantity in ethanol to produce a solution of 2.5 mg per ml. Measure the absorbance within the range of 230-350 nm (Appendix IV A). It exhibits a maximum at 289 nm, the absorbance is about 0.53.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of camphor (Appendix XVI).

Non-volatile matter Heat 2.0 g at 100°C to volatilize the camphor completely and dried to constant weight. It leaves not more than 1 mg of residue.

Water Dissolve 1.0 g in 10 ml of petroleum ether. The solution is clear.

Category Skin-irritant.

Storage Preserve in tightly closed containers.

Compound Camphor Tincture

Compound Camphor Tincture contains not less than 0.425 mg and not more than 0.575 mg of morphine ($C_{17}H_{19}NO_3$) per ml.

Formula	Camphor	3 g
	Opium Tincture	50 ml
	Benzoate	5 g
	Anise oil	3 ml

Ethanol (56%)

a quantity

To make

1000 ml

Processing Dissolve benzoate, camphor and anise oil with 900 ml of 56% ethanol solution, add slowly opium tincture and a quantity of 56% ethanol solution to produce 1000 ml, mix well and filter.

Description A yellowish-brown liquid; odour, aromatic similar to camphor and anise oil; taste, sweet and pungent.

Identification To 10 ml add a quantity of ammonia TS to adjust pH to about 9. Extract with two portions of a mixture of chloroform-isopropanol (3 : 1), each of 20 ml, filter the combined extracts through anhydrous sodium sulfate, evaporate in vacuum the successive filtrate to dryness, dissolve the residue in 0.3 ml of methanol as the test solution. Dissolve a quantity of morphine CRS in methanol to produce a solution containing 1 mg per ml as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (17 : 2 : 1) as the mobile phase. Apply separately to the plate 10 µl of each of the above two solutions. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. The principal spot in the chromatogram obtained with the test solution corresponds in colour and position to the principal spot obtained with the reference solution.

Ethanol content 52%-60% (Appendix VII E)

Other requirements Complies with the general requirements for tinctures (Appendix I C).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (2 : 2 : 1) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

System suitability test of solid phase extraction column Using a solid phase extraction column packed with octadecylsilane bonded silica gel. Carry out the test as described under the Procedure. Transfer 1 ml of a solution in 5% acetic acid solution containing 0.25 mg of morphine CRS per ml, accurately measured, to the column pretreated, collect the eluate into a 5 ml volumetric flask to volume and mix well. Respectively inject 10 µl of the eluate and the reference solution as described under the Procedure into the column, record the chromatogram. The ratio of the peak area of morphine obtained in the chromatogram of the eluate to that of the reference solution is not less than 0.97 and not more than 1.03.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH value about 9 (add drops of ammonia TS to a quantity of water until the pH value is about 9) until the pH value of the eluate is about 9. Place one bottle being examined in an ultrasonic bath for 10 minutes and mix well. Measure accurately 5 ml into a conical flask with stopper, evaporate to dryness, add accurately 10 ml of 5% acetic acid solution, Place in an ultrasonic bath for 10 minutes to dissolve morphine, allow to cool to room temperature and filter. Measure accurately 1 ml of the successive filtrate to the above washed column, adjust the solution in the column to pH 9 with drops of ammonia TS (defined the quantity of ammonia TS using another same volume of the successive filtrate

previously), mix well, rinse with 20 ml of water to make the drips neutral after no solvent drips. Elute with 5% acetic acid solution containing 20% methanol, collect the eluate into a 5 ml volumetric flask to volume and mix well. Inject 10 μ l of the eluate into the column, record the peak areas correspondingly obtained in the chromatogram. Repeat the operation, using a solution in 5% acetic acid solution containing 20% methanol, containing 0.05 mg of morphine CRS per ml instead of the eluate. Calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Category Antitussive, analgetic and antidiarrheal.

Storage Preserve in tightly closed containers, stored in cool and dry place and protected from light.

Capreomycin Sulfate

[1405-37-4]

Capreomycin Sulfate has a potency of not less than 830 Capreomycin Units per mg, calculated on the dried basis.

Description White or almost white powder; odourless; hygroscopic. Freely soluble in water; practically insoluble in ethanol, chloroform or ether.

Specific optical rotation -26° to -36° , in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of 10% ammonium acetate solution-10% ammonium hydroxide solution-acetone (9 : 1 : 10) as the mobile phase. Apply separately to the plate 3 μ l each of two solutions containing (1) 20 mg per ml of the substance being examined and (2) 20 mg per ml of capreomycin sulfate CRS. After developing and removal of the plate, dry it in air and examine under an ultraviolet light (254 nm). The colour and position of the two principal spots in the chromatogram obtained with solution (1) is correspond to the two principal spots obtained with solution (2).

(2) Carry out the method described under capreomycin I, using two solutions in water containing (1) 0.12 mg of the substance being examined per ml and (2) 0.12 mg of capreomycin sulfate CRS per ml. The retention time of principal peak of capreomycin sulfate in the chromatogram of solution (1) is identical with that of principal peaks of capreomycin sulfate in the chromatogram of solution (2).

(3) The light absorption of a solution of 20 μ g per ml in hydrochloric acid solution (9 \rightarrow 1000) exhibits a maximum at 269 nm (Appendix IV A).

(4) The light absorption of a solution of 20 μ g per ml in 0.4% sodium hydroxide solution exhibits a maximum at 287 nm (Appendix IV A).

(5) The aqueous solution yields the reactions characteristic of sulfates (Appendix III).

Tests (1) (3) and (4) may be omitted if tests (2) and (5) are carried out. Test (2) may be omitted if tests (1), (3), (4) and (5) are carried out.

Acidity or alkalinity An aqueous solution of 30 mg per ml, pH 5.0-7.5 (Appendix VI H).

Clarity and colour of solution Dissolve 5 portions each of 0.6 g in 5 ml of water respectively the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B); any

colour produced is not more intense than that of reference solution Y₅ (Appendix IX A, method 1).

Capreomycin I Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.016 mol/L sodium hexanesulfonate solution-methanol-acetonitrile-glacial acetic acid (60 : 25 : 25 : 2) as mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of the column is not less 1000, calculated with reference to peak area of Capreomycin I. The relative retention time of the Capreomycin II peak to that of Capreomycin I is about 0.6-0.7 and the resolution of factor between the peaks of Capreomycin I and Capreomycin II complies with the related requirements.

Procedure Dissolve a quantity, accurately weighed, in water to produce a solution of 0.12 mg per ml, inject 10 μ l into the column and record the chromatogram. The peak area of Capreomycin I is not less than 90% of the sum of the peak areas of Capreomycin I and Capreomycin II.

Loss on drying When dried to constant weight at 105°C, loses not more than 6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 3.0% (Appendix VIII N).

Bacterial endotoxins Carry out the method (Appendix XI E). It contains not more than 0.3 EU per mg.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), using not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Weigh accurately a quantity and add phosphate BS (pH 7.8-8.0) to produce a solution of about 1000 Units per ml, carry out the microbiological assay of antibiotics (Appendix XI A). 1000 Capreomycin Units are equivalent to 1 mg of Capreomycin.

Category Antibiotic Antituberculous.

Storage Preserve in hermetically sealed containers, stored in a cool and dry place.

Preparation Capreomycin Sulfate for Injection

Capreomycin Sulfate for Injection

Capreomycin Sulfate for Injection is a sterile powder of capreomycin sulfate. It has a potency of not less than 830 capreomycin Units per mg, calculated on the dried basis. It contains not less than 90.0% and not more than 110.0% of the labelled amount of capreomycin, calculated on the basis of the average weight of contents.

Description A white or almost white powder.

Identification Complies with the tests for Identification described under Capreomycin Sulfate.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of the reference suspension II (Appendix IX B); any colour produced is not more intense than that of the reference solution Y₅ (Appendix IX A, method 1).

Acidity or alkalinity, Capreomycin I, Loss on drying, Residue on ignition, Bacterial endotoxins and sterility Complies with the corresponding requirement described under Capreomycin Sulfate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Capreomycin Sulfate, using an accurately weighed quantity of the mixed contents obtained under the test for weight variation of the contents.

Category As described under Capreomycin Sulfate.

Strength 0.5 g (500000 Units)

Storage Preserve in well closed containers, stored in a cool and dry place.

Captopril

$C_9H_{15}NO_3S$ 217.29

[62571-86-2]

Captopril is 1-[(2S)-3-mercapto-2-methyl-1-oxopropyl]-L-proline. It contains not less than 97.5% of $C_9H_{15}NO_3S$, calculated on the dried basis.

Description a white or almost white crystalline powder; odour characteristic, alliaceous; taste, saline. Freely soluble in methanol, ethanol or chloroform; soluble in water.

Melting range 104-110°C (Appendix VI C).

Specific optical rotation -126° to -132° , in a solution of 20 mg per ml in ethanol (Appendix VI E).

Identification (1) Dissolve 25 mg in 2 ml of ethanol, add a quantity of sodium nitrate crystals and 10 drops of dilute sulfuric acid, shake, a red colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of captopril (Appendix XVI).

Captopril disulfide Protect from light throughout the procedure. Dissolve a quantity in methanol to produce a solution of 2 mg per ml (solution 1) (freshly prepared). Dissolve a quantity of captopril CRS in methanol to produce a solution of 30 μ g per ml (solution 2). Dissolve a quantity of captopril CRS and captopril disulfide CRS in methanol to produce a solution of 10 μ g per ml respectively (solution 3). Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 9% tetrahydrofuran solution in methanol-0.05% phosphoric acid solution (33 : 67) as the mobile phase. The wavelength of the detection is 220 nm. Inject 20 μ l of solution (3) into the column, adjust the attenuation so that the peak height of captopril in the chromatogram is 50% of full scale of the chart, the relative retention time for captopril is 1.0 and for captopril disulfide is about 3.2. Inject accurately 20 μ l of solution (1) and solution (2), into the column respectively and record the chromatogram. The area of the peak of captopril disulfide in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of potassium sulfate standard solution (0.05%).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 2.0 g.

Heavy metals To the residue obtained in the test for Residue on ignition add 1 ml of nitric acid, evaporate to dryness and expel completely the nitrogen oxide vapor. Add 2 ml of hydrochloric acid and evaporate to dryness on a water bath. Add 5 ml of water and evaporate to dryness again. Dissolve the residue in a mixture of 15 ml of water and 4 ml of sodium acetate BS (pH 3.5) by warming, dilute with water to 50 ml and mix well. Carry out the limit test for heavy metals (Appendix VIII H, method 1), using 25 ml of the resulting solution; not more than 0.002%.

Zinc Transfer the remaining 25 ml of the solution obtained in the test for Heavy metals to a 50 ml Nessler cylinder, add 4 ml of hydrochloric acid solution (1 \rightarrow 2) and 3 ml of potassium ferrous TS, dilute with water to volume and mix well. Any opalescence produced is not more pronounced than that of a reference using 3.0 ml of zinc standard solution (dissolve 44 mg, weighed accurately, of zinc sulfate in water in a 100 ml volumetric flask, dilute with water to volume and mix well; measure accurately 10 ml to another 100 ml volumetric flask, dilute with water to volume and mix well. Each ml is equivalent to 10 μ g of Zn) prepared in the same manner (0.003%).

Assay Dissolve about 0.3 g, weighed accurately, in 100 ml of water with shaking, add 10 ml of dilute sulfuric acid, 1.0 g of potassium iodide and 2 ml of starch TS. Titrate with potassium iodate (0.01667 mol/L) VS until a pale blue colour appears and persists for 30 seconds. Perform a blank determination and make any necessary correction. Each ml of potassium iodate (0.01667 mol/L) VS is equivalent to 21.73 mg of $C_9H_{15}NO_3S$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Captopril Tablets

Captopril Tablets

Captopril Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of captopril ($C_9H_{15}NO_3S$).

Description White or almost white tablets or sugar coated or film coated tablets with white or almost white core.

Identification Dissolve a quantity of the powdered tablets equivalent to about 50 mg of captopril in ethanol and filter. The filtrate complies with test (1) for Identification described under Captopril.

Captopril disulfide Protect from light throughout the procedure. To a quantity of the powdered tablets, weighed accurately, equivalent to about 25 mg of captopril in a 50 ml volumetric flask, add a quantity of the mobile phase and ultrasonicate it for 15 minutes. Cool to room temperature, dilute to volume with the mobile phase and mix well. Filter, using the successive filtrate as the test solution (use it within 8 hours). To a quantity of captopril CRS add methanol to produce a solution of 0.1 mg per ml (solution 1). To a quantity of captopril disulfide CRS add methanol to produce a solution of 0.5 mg per ml (solution 2). Transfer 1 ml of solution (1) and 3 ml of solution (2) to a 100 ml

volumetric flask, dilute to volume with the mobile phase and mix well, using the resulting solution as reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.01 mol/L disodium hydrogen phosphate solution-methanol-acetonitrile (70 : 25 : 5) as the mobile phase, adjust pH to 3.0 ± 0.05 with phosphoric acid. Detection wavelength is 215 nm, maintain the temperature of the column at 60°C and the flow rate 1.5 ml per minute. Inject accurately 50 μ l of the reference solution into the column, adjust the attenuation so that the peak height of captopril disulfide in the chromatogram is about 50% of full scale of the chart, the relative retention time for captopril is 1.0 and for captopril disulfate is about 3.4. Inject accurately 50 μ l of the test solution and the reference solution into the column respectively and record the chromatogram. The area of the peak of captopril disulfide in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution at 20 minutes (45 minutes, if the tablets are sugar coated) and filter, transfer the successive filtrate as the test solution. Dissolve an accurately weighed quantity of captopril CRS in water and dilute to produce a solution with the same concentration as the test solution as the reference solution. Carry out the method for the Test described under captopril disulfide, inject accurately measured 20 μ l each of the resulting solutions into the column and record the chromatogram, calculate the dissolution of $C_9H_{15}NO_3S$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 50 tablets (25 mg) or 100 tablets (12.5 mg) with sugar coating removed. Weigh accurately a quantity of the powdered tablets equivalent to about 0.45 g of captopril, add 100 ml of water and shake for 30 minutes to dissolve captopril. Carry out the Assay described under Captopril, beginning at the words "add 10 ml of dilute sulfuric acid...". Each ml of potassium iodate (0.01667 mol/L) VS is equivalent to 21.73 mg of $C_9H_{15}NO_3S$.

Category As described under Captopril.

Strength (1) 12.5 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Compound Captopril Tablets

Compound Captopril Tablets contain not less than 9.0 mg and not more than 11.0 mg of captopril ($C_9H_{15}NO_3S$), and not less than 5.4 mg and not more than 6.6 mg of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in each tablet.

Formula	Captopril	10 g
	Hydrochlorothiazide	6 g
	Excipient	a quantity
	To make	1000 tablets

Description White or almost white tablets.

Identification (1) Shake thoroughly 1 powdered tablet with 5 ml of water, add a quantity of alkaline sodium nitroprusside TS, a purple colour is produced.

(2) Shake thoroughly 3 powdered tablets with 15 ml of water to dissolve captopril, filter. Dry the residul and put into a test-tube, add 10 ml of sodium hydroxide TS shake to dissolve hydrochlorothiazide. Filter, boil 3 ml of the filtrate for 5 minutes and allow to cool to room temperature. Add 5 ml of chromotropic acid TS and heat on a water bath, a bluish violet colour is produced.

Content uniformity Comply with the requirements (Appendix X E).

Captopril To 1 tablet in a conical flask with stopper add 50 ml of water and shake vigorously for about 30 minutes to dissolve captopril. Add 5 ml of diluted sulfuric acid, then add 0.5 g of potassium iodide and 2 ml of starch IS, titrate with potassium iodate (0.001667 mol/L) VS until the colour changes to pale blue lasting for 30 seconds. Perform a blank determination and make any necessary correction. Each ml of potassium iodate (0.001667 mol/L) VS is equivalent to 2.173 mg of $C_9H_{15}NO_3S$.

Hydrochlorothiazide Place 1 tablet in a 250 ml volumetric flask, proceed as described under Hydrochlorothiazide in Assay beginning at the words "add a quantity of warmed hydrochloric acid solution (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml)...", calculate the content of $C_7H_8ClN_3O_4S_2$.

Dissolution Hydrochlorothiazide Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of hydrochloric acid solution (dilute 24 ml of dilute hydrochloric acid with water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 150 rpm. Withdraw 10 ml of the solution at 30 minutes and filter. Measure the absorbance of the successive filtrate at 272 nm (Appendix IV A). Calculate the dissolution of $C_7H_8ClN_3O_4S_2$ from each tablet, taking 640 as the value of A (1%, 1 cm); not less than 60% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Captopril Weigh accurately and powder 70 tablets. To an accurately weighed quantity of the powdered tablets equivalent to about 0.3 g of captopril in a conical flask with stopper add 100 ml of water, shake for 30 minutes to dissolve captopril. Add 10 ml of diluted sulfuric acid, 1 g of potassium iodide and 2 ml of starch IS, titrate with potassium iodate (0.01667 mol/L) VS until the colour changes to pale blue lasting for 30 seconds. Perform a blank determination and make any necessary correction. Each ml of potassium iodate (0.01667 mol/L) VS is equivalent to 21.73 mg of $C_9H_{15}NO_3S$.

Hydrochlorothiazide To an accurately weighed quantity of the above powdered tablets equivalent to about 12 mg of hydrochlorothiazide in a 500 ml volumetric flask add a quantity of warmed hydrochloric acid solution (dilute 24 ml of diluted hydrochloric acid with water to 1000 ml), shake for 30 minutes, allow to cool and dilute to volume, mix well and filter. Transfer 10 ml of the successive filtrate, accurately measured, to a 25 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 272 nm (Appendix IV A), calculate the content of $C_7H_8ClN_3O_4S_2$, taking 640 as the value of A (1%, 1 cm).

Category Antihypertensive.

Storage Preserve in tightly closed containers, stored in a dry place at a temperature below 30°C and protected from light.

Carbachol

$C_6H_{15}ClN_2O_2$ 182.65

Carbachol is 2-[(Aminocarbonyl)oxy]-N, N, N-tri-methylethanaminium chloride. It contains not less than 99.0% of $C_6H_{15}ClN_2O_2$, calculated on the dried basis.

Description A white crystals; hygroscopic. Very soluble in water; sparingly soluble in ethanol; practically insoluble in chloroform and ether.

Melting range 200–204°C, with decomposition (Appendix VI C).

Identification (1) To about 50 mg, add 10 ml of ethanolic potassium hydroxide solution, heat gently to boil for 1–2 minutes, a white precipitate and ammonia odour are produced. Discard the supernatant liquid and add a few drops of 3 mol/L hydrochloric acid solution. Bubble is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carbachol (Appendix XVI).

(3) Yield the reactions characteristic of chlorides (Appendix III).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid and 10 ml of perchloric acid TS, add 2 drops of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour change to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.27 mg of $C_6H_{15}ClN_2O_2$.

Category M choline receptor excitomotor.

Storage Preserve in well closed containers.

Preparation Carbachol Injection

Carbachol Injection

Carbachol Injection is a sterile solution of Carbachol in Water for Injection. It contains not less than 90.0% and not more than 115.0% of the labelled amount of carbachol ($C_6H_{15}ClN_2O_2$).

Description A clear, colourless liquid.

Identification To 5 ml, add 1 ml of 1 mol/L sodium hydroxide solution and 2 ml of 0.2% hexanitrodiphenylamine, mix well. Add 15 ml of dichloromethane, shake for 1 minute, allow to separate, an amber colour is produced in dichloromethane layer.

pH value 5.5–7.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B)

Assay Take the injection as test solution. Dissolve a quantity of carbachol CRS, accurately weighed, in water to produce a solution of 0.1 mg per ml as the reference solution. Transfer 2 ml each of the test solution and the reference solution, accurately measured, to two 50 ml iodine flasks, add 1.0 ml of 0.1 mol/L hydrochloric acid solution, mix well, add 4.0 ml of sodium hypochlorite TS (dilute one volume of sodium hypochlorite solution to 15 volumes with water, allow to stand for 30 minutes, mix with equal volume of 1 mol/L sodium hydroxide solution. Prepared before use), wash the inner wall with water, mix well, allow to stand for 15 minutes (accurately), add 2.0 ml of 0.5% phenol solution, wash the inner wall with a quantity of water, mix well. Stand for 5 minutes. Add 2.0 ml of 3.5 mol/L hydrochloric acid solution, wash the inner wall with 0.1 mol/L hydrochloric acid solution and acidify the solution obviously, mix well. Add 1.0 ml of 0.3% potassium iodide solution, mix well, allow to stand for 5 minutes. Add 3.0 ml of starch IS, mix well. Transfer separately the above solutions in 50 ml volumetric flask, wash the iodine flask with a quantity of water, transfer the washings to the same volumetric flask, dilute with water to volume, mix well. Measure the absorbance at 590 nm (Appendix IV A). Calculate the content of $C_6H_{15}ClN_2O_2$.

Category As described under Carbachol.

Strength 1 ml : 0.1 mg

Storage Preserve in well closed containers.

Carbamazepine

$C_{15}H_{12}N_2O$ 236.27

[298-64-4]

Carbamazepine is 5H-dibenz [b, f] azepine-5-carboxamide. It contains not less than 97.0% and not more than 103.0% of $C_{15}H_{12}N_2O$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless.

Freely soluble in chloroform; sparingly soluble in ethanol; practically insoluble in ether or water.

Melting range 189–193°C (Appendix VI C).

Identification (1) Heat 0.1 g with 2 ml of nitric acid in a water bath, an orange-red colour is produced.

(2) The light absorption of a solution of 10 µg per ml in ethanol exhibits maxima at 238 nm and 285 nm (Appendix IV A), the absorbance at 285 nm is 0.47–0.51.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carbamazepine (Appendix XVI).

Acidity or alkalinity Stir 1.0 g in 20 ml of freshly boiled and cooled water for 15 minutes, filter. Add 1 drop of phenolphthalein IS to 10 ml of the successive filtrate and titrate with sodium hydroxide (0.01 mol/L) VS, not more than 0.50 ml is required. Then titrate with hydrochloric acid (0.01 mol/L) VS, using 3 drops of methyl red IS as indicator, not more than 1.0 ml is required.

Chlorides Boil 1.0 g in 100 ml of water, boil, cool to room

temperature and filter. Carry out the limit test for chlorides (Appendix VIII A), using 50 ml of the successive filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-cyclohexane-methanol (5 : 4 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions of the substance being examined in chloroform containing (1) 25 mg per ml and (2) 0.25 mg per ml. After developing and removal of the plate, dry it in air. Spray with a 0.5% solution of potassium dichromate in 20% (ml/ml) sulfuric acid, dry it in air and examine under ultraviolet light (365 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C for 2 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve an accurately weighed quantity in ethanol to produce a solution of about 10 μ g per ml and measure the absorbance at 285 nm (Appendix V H). Repeat the operation using carbamazepine CRS instead of the substance being examined and calculate the content of $C_{15}H_{12}N_2O$.

Category Anticonvulsant and analgesic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Carbamazepine Capsules
(2) Carbamazepine Tablets

Carbamazepine Capsules

Carbamazepine Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of carbamazepine ($C_{15}H_{12}N_2O$).

Identification The contents of carbamazepine capsules comply with tests (1) and (2) for Identification described under Carbamazepine.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 24 ml of dilute hydrochloric acid diluted with water to 1000 ml as the dissolution medium, adjust the rotational speed of the paddle to 150 rpm. Withdraw 10 ml of the solution at 60 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution containing 6-15 μ g of carbamazepine per ml and measure the absorbance at 285 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{12}N_2O$ from each capsule, taking 518 as the value of A (1%, 1 cm); not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation, equivalent to about 50 mg of carbamazepine. Carry out the Assay described under Carbamazepine tablets, beginning at the words "in a 50 ml volumetric flask".

Category As described under Carbamazepine.

Strength 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Carbamazepine Tablets

Carbamazepine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of carbamazepine ($C_{15}H_{12}N_2O$).

Description White tablets.

Identification Comply with tests (1) and (2) for Identification described under Carbamazepine, using a quantity of powdered tablets.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 24 ml of dilute hydrochloric acid diluted with water to 1000 ml as the dissolution medium, adjust the rotational speed of the paddle to 150 rpm. Withdraw 10 ml of the solution at 60 minutes and filter. Dilute an accurately measured quantity of the successive filtrate, with the dissolution medium to produce a solution containing 6-15 μ g of carbamazepine per ml and measure the absorbance at 285 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{12}N_2O$ from each tablet, taking 518 as the value of A (1%, 1 cm), not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 50 mg of carbamazepine in a 50 ml volumetric flask and add about 40 ml of ethanol. Heat in a water bath with shaking to dissolve carbamazepine, cool. Add ethanol to volume, mix well and filter with a dry filter paper. Measure accurately 2 ml of successive filtrate into 200 ml volumetric flask and dilute above solution with the hydrochloric acid dilute 24 ml of dilute hydrochloride acid solution to 1000 ml with water to the volume, mix well. Measure the absorbance at 285 nm (Appendix IV A) and calculate the content of $C_{15}H_{12}N_2O$, taking 518 as the value of A (1%, 1 cm).

Category, Storage As described under Carbamazepine.

Strength (1) 0.1 g (2) 0.2 g

Carbidopa

$C_{10}H_{14}N_2O_4 \cdot H_2O$ 244.25

Carbidopa is benzenepropanoic acid, α -hydrazino-3,4-dihydroxy- α -methyl-mono-hydrate, (S)-. It contains not less than 99.0% of $C_{10}H_{14}N_2O_4$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; almost odourless.

Slightly soluble in water or methanol, practically insoluble in ethanol or chloroform; freely soluble in dilute hydrochloric acid.

Specific optical rotation -21.0° to -23.5° , in a solution of 10 mg per ml in aluminium trichloride solution (Dissolve 40

g of aluminium trichloride and dilute to 60 ml, shake, add 0.5 g of active carbon if any colour produced, stir for 10 minutes, filter, adjust the pH value to 1.5 with 10% sodium hydroxide solution, by shaking in a heat water bath and allow to cool to room temperature (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 50 µg per ml in 0.1 mol/L hydrochloric acid solution at 281 nm (Appendix IV A), the value of A (1%, 1 cm) is 117-129.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Carbidopa (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of butanol-toluene-butanone-pyridine-glacial acetic acid water (1 : 3 : 3 : 1 : 1.5 : 0.8) as the mobile phase. Apply separately to the plate 10 µl of each of four solutions in 1% hydrochloric acid methanol solution containing (1) 10 mg per ml, (2) 50 µg per ml, (3) 100 µg per ml and (4) 150 µg per ml of the substance being examined. After developing and removal of the plate, dry it in air and expose in iodine vapour for 15 minutes. The number of the spots apart from principal spot obtained with solution (1) is not more than 2. Any secondary spot in the chromatogram obtained with the solution (1) is not more intense than the principal spots obtained with solutions (2), (3) and (4), the total amount of impurities does not exceed 2.0%.

Water 6.9%-7.9% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve 0.25 g of the substance being examined, accurately weighed, with exact 15 ml of perchloric acid (0.1 mol/L) VS. Add 15 ml of acetic anhydride and 2 drops of crystal violet IS. Titrate with sodium acetate (0.1 mol/L) VS until green colour is produced. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 22.62 mg $C_{10}H_{14}N_2O_4$.

Category Decarboxylase inhibitor.

Storage Preserve in tightly closed container, protected from light.

Preparation Carbidopa Tablets

Carbidopa Tablets

Carbidopa Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of anhydrous carbidopa ($C_{10}H_{14}N_2O_4$).

Description Almost white tablets.

Identification (1) To a quantity of the powder, equivalent to about 10 mg of carbidopa, add 10 ml of methanol, shake, and filter, separately prepare 2 of the filtrate. To one solution add 1 ml each of the fresh 0.2% ferrous sulfate solution and 1% potassium sodium tartrate solution, and 20-40 mg of ammonium acetate. A bluish-purple colour is produced. Add one drop of concentrated ammonia solution, shake, then the purple colour is getting more intense. To another solution, add 0.5 ml of *p*-dimethylamino-

benzaldehyde solution (To 0.4 g of *p*-dimethylamino-benzaldehyde, add 0.1 mol/L sulfuric acid solution to 10 ml, an orange yellow colour is produced.

(2) The light absorption of the solution under Assay exhibits maximum at 281 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 750 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw a quantity of the solution at 30 minutes and filter. Carry out the method described under Assay, using above filtrate, beginning at the words "Measure the absorbance...". Calculate the dissolution of $C_{10}H_{14}N_2O_4$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer a quantity, accurately weighed, equivalent to about 50 mg of carbidopa, to a 100 ml volumetric flask, dissolve carbidopa with 0.1 mol/L hydrochloric acid solution and dilute to volume, shake and filter, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, dilute to volume with 0.1 mol/L hydrochloric acid solution, shake. Measure the absorbance of the resulting solution at 281 nm (Appendix IV A). Calculate the content of Carbidopa, taking 123 as the value of A (1%, 1 cm).

Category As described under Carbidopa.

Strength 25 mg (calculated as $C_{10}H_{14}N_2O_4$)

Storage Preserve in tightly closed container, protected from light.

Carbimazole

$C_7H_{10}N_2O_2S$ 186.23

[22232-54-8]

Carbimazole is ethyl 3-methyl-2-thio-2,3-dihydro-1H-imidazole-1-carboxylate. It contains not less than 98.5% of $C_7H_{10}N_2O_2S$, calculated on the dried basis.

Description A white or almost white crystalline powder; odour, characteristic; tasteless at first, followed by a bitter taste.

Freely soluble in chloroform; sparingly soluble in ethanol; slightly soluble in water or ether.

Melting point 122-125°C (Appendix VI C).

Identification (1) Dissolve 10 mg in 5 ml of water by warming, cool to room temperature and add 1 ml of dilute potassium iodobismuthate TS; a scarlet colour is produced.

(2) The light absorption of the solution obtained in Assay exhibits maxima at 227 nm and 292 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carbimazole (Appendix XVI).

Thiamazole Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-acetone (4 : 1) as

the mobile phase. Apply separately to the plate 10 μ l each of two solutions in chloroform containing (1) 10 mg per ml of the substance being examined and (2) 50 μ g per ml of thiamazole CRS. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2) (0.5%).

Loss on drying When dried to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Transfer about 50 mg, accurately weighed, to a 500 ml volumetric flask, add water to dissolve it and then dilute to volume, mix well. Measure accurately 10 ml to a 100 ml volumetric flask, add 10 ml of hydrochloric acid solution (9→100), add water to volume and mix well. Measure the absorbance of the resulting solution at 292 nm (Appendix IV A) and calculate the content of $C_7H_{10}N_2O_2S$, taking 557 as the value of A (1%, 1 cm).

Category Antithyroid agent.

Storage Preserve in tightly closed containers.

Preparation Carbimazole Tablets

Carbimazole Tablets

Carbimazole Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of carbimazole ($C_7H_{10}N_2O_2S$).

Description White tablets.

Identification (1) Comply with test (1) for Identification described under Carbimazole, using a quantity of powdered tablets equivalent to about 10 mg of carbimazole. (2) The light absorption of the solution obtained in the Assay exhibits maxima at 227 nm and 292 nm (Appendix IV A).

Thiamazole Powder 20 tablets, with a quantity of chloroform, triturate to dissolve carbimazole, filter. Wash the filter with chloroform, combine the filtrate and washing into a 10 ml volumetric flask, dilute to volume with chloroform, mix well and use it as solution (1). Dissolve an accurately weighed quantity of thiamazole CRS in chloroform to produce a solution of 100 μ g per ml and use it as solution (2). Comply with the test for Thiamazole described under Carbimazole (1.0%).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 600 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 50 rpm. Withdraw 5 ml of the solution at 45 minutes and filter. Measure the absorbance of the successive filtrate at 292 nm (Appendix IV A), and calculate the dissolution of $C_7H_{10}N_2O_2S$ from each tablet, taking 557 as the value of A (1%, 1 cm), not less than 75% of the labelled amount is dissolved.

Content uniformity Triturate 1 tablet in a mortar with a quantity of water. Transfer with 80 ml of water in portions to a 100 ml volumetric flask. Shake in a water bath at about 35°C for 5 minutes to dissolve the carbimazole. Cool to room temperature. Add water to volume, mix well and filter. Transfer 20 ml of the successive filtrate, accurately measured, to a 100 ml volumetric flask. Proceed as described in the Assay, beginning at the words "add 10 ml of hydrochloric acid solution...". Comply with the requirements (Appendix X E).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 25 mg of carbimazole in a 250 ml volumetric flask and add about 100 ml of water. Shake thoroughly in a water bath at about 35°C for 5 minutes, cool to room temperature. Add water to volume, mix well and filter. Transfer 10 ml of the successive filtrate, accurately measured, to a 100 ml volumetric flask, add 10 ml of hydrochloric acid solution (9→100), dilute with water to volume and mix well. Measure the absorbance at 292 nm (Appendix IV A) and calculate the content of $C_7H_{10}N_2O_2S$, taking 557 as the value of A (1%, 1 cm).

Category As described under Carbimazole.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Carbocysteine

$C_5H_9NO_4S$ 179.19

[2387-59-9]

Carbocysteine is S-(carboxymethyl)-cysteine. It contains not less than 98.0% and not more than 101.5% of $C_5H_9NO_4S$, calculated on the dried basis.

Description A white crystalline powder; odourless. Sparingly soluble in hot water; very slightly soluble in water; insoluble in ethanol or acetone; freely soluble in acid or alkaline solutions.

Specific optical rotation Dissolve about 5 g, accurately weighed, in 10 ml each of water and 5 mol/L sodium hydroxide solution, the solution is clear. Adjust pH value of the solution to 6.0 with 2 mol/L hydrochloric acid solution, transfer to a 50 ml volumetric flask, dilute with water to volume, mix well; -32.5° to -36.0° (Appendix VI E).

Identification (1) Dissolve about 50 mg in 5 ml of water on heating, add a few drops of ninhydrin TS and heat, a violet colour is produced.

(2) To about 0.1 g add 2 ml of sodium hydroxide TS, heat to boil, the odour of ammonia is perceived, the vapour turns moistened red litmus paper to blue; a black precipitate is produced on adding lead acetate TS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carbocysteine (Appendix XVI).

Acidity A 1% suspension; pH 2.8-3.0 (Appendix VI H).

Clarity of solution Dissolve 0.50 g in 10 ml of 2 mol/L hydrochloric acid solution, the transmittance of the solution at 430 nm (Appendix IV A) is not less than 95.0%.

Cysteine Dissolve 0.20 g in 1 ml of 5% ammonia solution, add 3 ml of water and mix well, place in an ice water bath for 10 minutes, add 0.5 ml of 1% sodium nitroprusside solution and mix well, using the resulting solution as the test solution. To 1 ml of the solution containing 50 μ g of cysteine CRS per ml add 0.1 g of carbocysteine and 3 ml of water, then repeat the operation in the same manner as

described under the test solution, using the resulting solution as the reference solution. Any colour produced of the test solution is not more intense than that of the reference solution (0.05%).

Chlorides Dissolve 0.20 g in 10 ml of dilute nitric acid, add water to produce 50 ml, carry out the limit test for chlorides (Appendix VIII A), using 10 ml of the solution. Any opalescence produced is not more pronounced than that of a reference solution using 6.0 ml of sodium chloride standard solution (0.15%).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Iron Dissolve 1.0 g in 10 ml of dilute hydrochloric acid, transfer to a 50 ml Nessler cylinder, add water to 25 ml, then add 50 mg of ammonium persulfate and dilute with water to 35 ml. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of water and 4 ml of hydrochloric acid in a 250 ml conical flask. Add 20 ml of water and 1 drop of 0.05% methyl orange solution, titrate slowly with potassium bromate (0.01667 mol/L) VS at 18-25°C until the red colour disappears. Each ml of potassium bromate (0.01667 mol/L) VS is equivalent to 8.960 mg of $C_5H_9NO_4S$.

Category Mucolytic.

Storage Preserve in tightly closed containers, stored in a dry and cool place.

Preparation (1) Carbocysteine Granules
(2) Carbocysteine Oral Solution
(3) Carbocysteine Tablets

Carbocysteine Granules

Carbocysteine Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of carbocysteine ($C_5H_9NO_4S$).

Description Orange-red to orange-yellow suspension granules; odour, fragrance; taste, sweet and feebly acid.

Identification (1) Comply with the test (1) for identification described under carbocysteine, using 0.1 g.
(2) Dissolve a quantity of the powdered granules equivalent to about 50 mg of carbocysteine, in 10 ml of 5% ammonia solution, filter. Use the filtrate as the test solution. Comply with the test (2) for identification described under carbocysteine tablets.

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Weigh accurately a quantity of mixed contents obtained in the test for weight variation equivalent to about 0.15 g of carbocysteine, carry out the method described under Carbocysteine, calculate the content of $C_5H_9NO_4S$.

Category As described under carbocysteine.

Strength (1) 0.2 g (2) 0.5 g

Storage Preserve in tightly closed containers, stored in a dry and cool place.

Carbocysteine Oral Solution

Carbocysteine Oral Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of carbocysteine ($C_5H_9NO_4S$).

Description A brownish yellow to pale brown viscous liquid; taste, sweet; odour, aromatic.

Identification (1) Complies with the test (1) for identification described under Carbocysteine.

(2) Dilute a quantity with water to produce a solution containing 5 mg of carbocysteine per ml as the test solution. Dissolve 50 mg of carbocysteine CRS with 5% ammonia solution, using it as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of butanol-glacial acetic acid-water (6 : 2 : 2) as the mobile phase. Apply separately to the same plate 5 μ l each of above two solutions. After developing and removal of the plate, dry it in air, spray with 1% ninhydrin solution in butanol and heat. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

pH value 5.0-7.5 (Appendix VI H).

Other requirements Complies with the general requirements for oral solutions (Appendix I O).

Assay *Reference preparation* Dissolve an accurately weighed quantity of carbocysteine CRS in phosphate BS (pH 6.6) to produce a solution of 200 μ g per ml.

Test preparation Measure accurately a quantity of the mixed contents obtained from 10 containers, dilute with phosphate BS (pH 6.6) to produce a solution of 200 μ g per ml.

Procedure Transfer 2.0 ml each of the two solutions, accurately measured, to 50 ml volumetric flask separately, add accurately 1 ml of 2% ninhydrin solution and 2 ml of phosphate BS (pH 6.6) and mix well. Heat on a boiling water bath for 15 minutes, cool quickly to room temperature, dilute with water to volume, and mix well. Measure the absorbance at 567 nm (Appendix VI A). calculate the content of $C_5H_9NO_4S$.

Category As described under Carbocysteine.

Strength (1) 10 mg : 0.2 g (2) 10 ml : 0.5 g

Storage Preserve in tightly closed containers, stored in a cool place, protected from light.

Carbocysteine Tablets

Carbocysteine Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of carbocysteine ($C_5H_9NO_4S$).

Description White tablets.

Identification (1) Comply with the test (1) for Identification described under Carbocysteine, using 0.1 g of the powdered tablets.

(2) Dissolve a quantity of powdered tablets equivalent to about 50 mg of carbocysteine in 10 ml of 0.5% ammonia solution to produce a solution as the test solution. Dissolve 50 mg of carbocysteine CRS with 5% ammonia solution, using it as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of butanol-glacial acetic acid-water (6 : 2 : 2) as the mobile phase. Apply separately to the same plate 10 μ l each of above two solutions. After developing and removal of the plate, dry it in air, spray with 1% ninhydrin solution in butanol and heat. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 1), using 1000 ml of phosphate BS (pH 6.6) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 10

successive filtrate as the test solution. Dissolve about 12.5 mg of the carbocysteine CRS, accurately weighed, in the dissolution medium in a 50 ml volumetric flask and dilute to volume, mix well, as the reference solution. Transfer 2 ml (for strength 0.25 g) or 5 ml (for strength 0.1 g) of the test solution and 2 ml of the reference solution to 50 ml volumetric flask, add 2 ml of 2% ninhydrin solution and 2 ml of dissolution medium, mix well, and warm for 15 minutes in a water bath, cool to room temperature, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 567 nm (Appendix IV A), calculate the dissolution of carbocysteine from each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Transfer an accurately weighed quantity of the powder equivalent to about 0.15 g of carbocysteine, carry out the method described under Carbocysteine, beginning at the words "in 10 ml of water and 4 ml of hydrochloric acid in a 250 ml conical flask...". Calculate the content of $C_5H_9NO_4S$.

Category As described under Carbocysteine.

Strength (1) 0.1 g (2) 0.25 g

Storage Preserve in tightly closed containers, stored in a dry and cool place.

Carbon Dioxide

CO₂ 44.01 [124-38-9]

Carbon Dioxide contains not less than 99.0% (ml/ml) of CO₂.

Description A colourless gas; odourless. The aqueous solution exhibits weak acid reaction.

Soluble in about 1 volume of water at normal pressure and 20°C.

Identification (1) On passing into barium hydroxide TS, a white precipitate is produced which dissolves in acetic acid with effervescence.

(2) Extinguishes a flame.

Acidity Add 0.2 ml of methyl orange IS to 100 ml of freshly boiled and cooled water and mix well. Transfer 50 ml each of the solution to Nessler cylinder (A) and (B). To cylinder (B) add 1.0 ml of hydrochloric acid (0.01 ml/L) VS and into cylinder (A) pass 1000 ml of the gas being examined at

a flow rate of 4000 ml/hr. The red colour in cylinder (A) is not more intense than that in cylinder (B).

Carbon monoxide, Phosphine, Hydrogen sulfide and Organic reducing substances To Nessler cylinder (A) and (B) add 25 ml of warm ammoniated silver nitrate TS and 3 ml of ammonia TS. Pass 1000 ml of the gas being examined into cylinder (A) at a flow rate of 4000 ml/hr. The resulting solution is clear and colourless compared with the solution in cylinder (B).

Assay Complete the Assay described under Oxygen, using the absorber shown in the figure and 125 ml of potassium hydroxide solution (1→2) as the absorbing liquid instead of copper wire and ammonia-ammonium chloride solution. Transfer acidified water (to methyl orange) into the reservoir, instead of saturated sodium chloride solution until the volume of the residual gas is constant. Measure the volume of the residual gas in the burette and calculate the content of CO₂.

The metal cylinder containing Carbon Dioxide must be kept at room temperature for at least 6 hours before the determination.

Category Respiration center stimulant.

Storage Kept under compression in approved metal cylinder.

Carboplatin

$C_6H_{12}N_2O_4Pt$ 371.26

Carboplatin is *cis*-diammine [cyclobutane-1,1-dicarboxylato (2-)-O,O'] platinum. It contains not less than 98.0% and not more than 102.0% of the labelled amount of $C_6H_{12}N_2O_4Pt$, calculated on the dried basis.

Description A white powder or crystalline powder; odourless.

Sparingly soluble in water; insoluble in ethanol, acetone, chloroform or ether.

Identification (1) To about 5 mg add a little of thiourea and a quantity of water, the solution turns to yellow on heating. (2) Dissolve a quantity in water to produce a solution of about 1 mg per ml, add 3 drops of 2 mol/L sulfuric acid solution, heat to boiling, add 2 drops of mercuric potassium iodide TS, a yellow colour is produced, which turns to redish brown immediately, and then to pale blue, purple and a black precipitate is produced on standing for 5 minutes. (3) To 25 mg on a evaporating dish add 2 ml of chlorinated sulfoxide, stir thoroughly, evaporate on a water bath to dryness, add 2 ml of ethanol solution saturated with oxammonium hydrochloride, and 0.5% sodium hydroxide ethanol solution to make alkaline, heat, cool, add dilute sulfuric acid to make the solution acidic, to the supernatant

add several drops of ferric chloride TS, the solution turns to brownish red or purple.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carboplatin (Appendix XVI).

Clarity of solution Dissolve 80 mg in 10 ml of water, the solution is clear.

Acidity or alkalinity pH 5.5-7.5 (Appendix VI H), using the solution obtained in the test for Clarity of solution.

Related substances Dissolve a quantity of the substance being examined in water to produce solutions of 1 mg per ml (solution 1) and 10 µg per ml (solution 2). Carry out the method as described under the Assay. Inject 10 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 10 µl of above two solutions, and record the chromatogram for three times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2).

Acid soluble barium Dissolve 80 mg in 10 ml of water, add 2 ml of dilute hydrochloric acid, heat to boiling for 5 minutes, replenish the evaporated water, cool to room temperature, filter through a filter paper moistened with hydrochloric acid solution (1 → 40), wash the residue and the funnel with a quantity volume (about 2 ml) of water, combine the washings and the filtrate, add 0.5 ml of dilute sulfuric acid, allow to stand for 30 minutes, no precipitate is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and water as the mobile phase, flow rate is 2 ml per minute, detection wavelength is 229 nm and the number of the theoretical plates of the

peak of carboplatin. The resolution factor between the peaks of carboplatin and internal standard complies with the related requirements.

Internal standard solution Dilute about 25 mg of ferritin, accurately weighed, in water in a 25 ml volumetric flask and dilute to volume, mix well.

Procedure Dissolve about 25 mg, accurately weighed, in water in a 25 ml volumetric flask and dilute to volume, mix well. Measure accurately 5 ml each of the test solution and the internal standard solution to a 25 ml volumetric flask, dilute with water to volume, mix well, inject 10 µl of the resulting solution into the column, and record the chromatogram. Repeat the operation, using carboplatin CRS instead of the substance being examined, calculate the content of $C_6H_{12}N_2O_4Pt$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Antineoplastic.

Storage Preserve in hermetically sealed containers, stored in a cool and dark place and protected from light.

Preparation Carboplatin for Injection

Carboplatin for Injection

Carboplatin for Injection is a sterile, lyophilized

preparation of carboplatin and an equal amount of dextran 40 or mannitol. It contains not less than 90.0% and not more than 110.0% of the labelled amount of $C_6H_{12}N_2O_4Pt$.

Description A white, friable mass or powder; odourless.

Identification Complies with tests (1), (2) and (3) for Identification described under carboplatin.

Clarity of solution A solution of 10 mg per ml in Water for Injection is clear.

Acidity or alkalinity pH 5.5-7.5 (Appendix VI H), using the solution obtained in test for Clarity of solution.

Related substances Complies with the test for Related substances described under carboplatin, using a solution of about 1 mg per ml in water.

Sterility Complies with the test for sterility (Appendix XI H), using a solution of 5 mg per ml in sterile water.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 5 mg per ml in Sodium Chloride Injection per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the mixed contents in the test for weight variation, carry out the Assay described under Carboplatin.

Category As described under Carboplatin.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in well closed containers, protected from light.

Carboprost Methylate

$C_{22}H_{38}O_5$ 382.54

[35700-21-1]

Carboprost Methylate is (Z)-7-[(1R,2R,3R,5S)-3,5-Dihydroxy-2-[(E)-(3S)-3-hydroxy-3-methyl-1-octenyl] cyclopentyl] -5-heptenoic acid methyl ester. It contains not less than 91.0% of $C_{22}H_{38}O_5$, calculated on the dried basis.

Description A white to pale yellow solid substance. Freely soluble in ether or ethanol; slightly soluble in water.

Identification (1) The retention time of the principal peak of Carboprost Methylate in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of Carboprost Methylate CRS in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Carboprost Methylate (Appendix XVI).

15-epimer Carry out the method for high performance liquid chromatography (Appendix V D), using the conditions described under Assay. Dilute the test solution under Assay with methanol to produce a pretest solution for about 8 mg per ml, inject 20 µl this solution into the column. Adjust

the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Then inject 20 μ l the test solution under Assay into the column, and record the chromatogram for twice the retention time of the principal peak. If there is the peak of 15-epimer in the chromatogram of the test solution, its area is not greater than 4.0% of that of the peak of carboprost methylate.

Loss on drying When dried in vacuum for 24 hours at room temperature, loses not more than 3.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 202 nm. Dissolve a quantity of 15-epimer CRS in the test solution to produce a solution of 0.2 mg each of 15-epimer and carboprost methylate per ml, and test with this solution. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of carboprost methylate. The resolution factor between the peaks of 15-epimer and carboprost methylate is more than 1.2.

Test preparation and procedure Dissolve a quantity, accurately weighed, in methanol to produce a solution of 0.2 mg per ml. Inject 20 μ l of the resulting solution, accurately measured, into the column, record the peak area obtained in the chromatogram. Repeat the operation, using the carboprost methylate CRS instead of the substance being examined. Calculate the content of $C_{22}H_{38}O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Prostaglandin.

Storage Preserve in tightly closed containers, stored at a temperature below -5°C and protected from light.

Preparation Carboprost Methylate Suppositories

Carboprost Methylate Suppositories

Carboprost Methylate Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of carboprost methylate ($C_{22}H_{38}O_5$).

Description Creamy white to pale yellow suppositories.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of carboprost methylate CRS.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Triturate 10 suppositories, accurately weighed, in an agate mortar and mix well. Weigh accurately a quantity, equivalent to about 2 mg of carboprost methylate, into a 10 ml volumetric flask, add methanol to volume, stopper tightly and sonicate in a water bath at 45°C for 3 minutes until carboprost methylate is solved, freeze in a refrigerator. Centrifuge after the suppository base has frozen and allow it to warm to room temperature. Use supernatant liquid as the test solution. Carry out the method described under the Assay of Carboprost Methylate. Calculate the content of $C_{22}H_{38}O_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Carboprost Methylate.

Strength (1) 0.5 mg (2) 1 mg

Storage Preserve in well closed containers, stored at a temperature below -5°C and protected from light.

Carmofur

$C_{11}H_{16}FN_3O_3$ 257.26

[61422-45-5]

Carmofur is 5-fluoro-N-hexyl-3,4-dihydro-2,4-dioxopri-midine-1 (2H)-carboxamide. It contains not less than 98.5% and not more than 101.5% of $C_{11}H_{16}FN_3O_3$, calculated on the dried basis.

Description A white crystalline powder; odourless, tasteless. Very soluble in dimethylformamide; freely soluble in trichloromethane; slightly soluble in methanol, ethanol or benzene; practically insoluble in water.

Melting range $110-114^{\circ}\text{C}$, with decomposition (Appendix VI C).

Identification (1) Transfer about 1 ml of saturated solution of chromium trioxide in sulfuric acid to a test tube. Rotate the test tube, the solution is coated evenly on the wall; add about 2 mg of the substance being examined, heat gently, rotate the test tube, the solution can no longer be coated evenly on the wall, but attached to the wall with greasiness. (2) The light absorption of a solution of 10 μ g per ml in trichloromethane exhibits a maximum at 258 nm (Appendix IV A). (3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carmofur (Appendix XVI).

Chlorides To 2.0 g add 100 ml of water, shake 15 minutes and filter. Measure 25 ml of the filtrate, carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.01%).

Sulfates Carry out the limit test for sulfates (Appendix VIII B), using 50 ml of the filtrate obtained in the test for Chlorides. Any opalescence produced is not more pronounced than that of a reference solution using 2.0 ml of potassium sulfate standard solution (0.02%).

Fluorine Weigh accurately about 30 mg and carry out the limit test for fluorides (Appendix VIII E). It contains not less than 6.6% and not more than 7.4% of fluorine.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-acetone (5 : 3) as the mobile phase. Apply separately to the plate 15 μ l each of two solutions in a mixture of methanol-glacial acetic acid (99 : 1) containing (1) 20 mg per ml, (2) 0.1 mg per ml of the substance being examined, after developing and removal of the plate, dry it in air and examine under ultra-violet light 254 nm. Any spot in the chromatogram other than the principal spot obtained with the solution (1) is not more intense than the principal spot obtained with the solution (2).

Loss on drying When dried in vacuum over phosphorous

pentoxide to constant weight, loses not more than 0.3% of its weight (Appendix VIII L).

Heavy metals To 0.50 g add 20 ml of water, shake 15 minutes and filter. To the filtrate, add 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1), not more than 0.002%.

Assay Dissolve about 0.2 g, weigh accurately, in 10 ml of dimethylformamide, add 5 drops of 0.3% thymol blue in anhydrous methanol, titrate with tetrabutylammonium hydroxide (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of tetrabutylammonium hydroxide VS is equivalent to 25.73 mg of $C_{11}H_{16}FN_3O_3$.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Carmofur Tablets

Carmofur Tablets

Carmofur Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of carmofur ($C_{11}H_{16}FN_3O_3$).

Description White tablets.

Identification (1) Complies with the test (1) for Identification described under Carmofur. Using a quantity of the powdered tablets equivalent to about 10 mg of carmofur. (2) The light absorption of the solution obtained under the Assay exhibits maximum at 258 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 24 ml of dilute hydrochloric acid and 210 ml of ethanol diluted with water to 1000 ml as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 60 minutes and filter. Measure accurately 5 ml of the successive filtrate into a 25 ml volumetric flask, dilute to volume with the dissolution medium and mix well as the test solution. Dissolve an accurately weighed carmofur CRS in a quantity of ethanol, dilute with the dissolution medium to produce a solution of about 8 µg per ml as the reference solution. Measure the absorbances of the test solution and the reference solution at 260 nm. Calculate the dissolution of $C_{11}H_{16}FN_3O_3$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder, equivalent to about 30 mg of carmofur, into a 100 ml volumetric flask, dissolve carmofur with a quantity of trichloromethane and dilute with the same solvent to volume, shake thoroughly and filter. Measure accurately 2 ml of the successive filtrate into a 50 ml volumetric flask, dilute to volume with trichloromethane, mix well. Measure the absorbance of the solution at 258 nm (Appendix IV A), calculate the content of $C_{11}H_{16}FN_3O_3$, taking 454 as the value of A (1%, 1 cm).

Category As described under Carmofur.

Strength 50 mg

Storage Preserve in tightly closed containers, and protected from light.

Carmustine

$C_5H_9Cl_2N_3O_2$ 214.05

[154-93-8]

Carmustine is 1,3-bis (α -chloroethyl) -1-nitrosourea. It contains not less than 96.0% and not more than 101.0% of $C_5H_9Cl_2N_3O_2$, calculated on the dried basis.

Description Colourless to pale yellow or pale yellowish green crystals or a crystalline powder; odourless. Soluble in methanol or ethanol; insoluble in water.

Melting point 30-32°C, with decomposition (Appendix VI C).

Identification (1) To about 50 mg add 5 ml of 0.5 mol/L sodium hydroxide solution, heat on a water bath for 5 minutes, shake thoroughly to dissolve carmustine, add 1 drop of phenolphthalein IS and nitric acid solution (1→2) dropwise until the colour disappears, then add 1 ml of 0.1 mol/L silver nitrate solution, a white precipitate is produced.

(2) To a quantity add water to produce a solution of 10 µg per ml. To 2 ml of the solution add 1 ml of sulfanilamide solution prepared by dissolving 50 mg of sulfanilamide in 10 ml of 2 mol/L hydrochloric acid solution, warm on a water bath at 50°C for 45 minutes, cool in an ice bath, add 0.2 ml of 1% N-1 (methyl naphthyl) ethylenediamine hydrochloride solution, a red colour is produced after 10 minutes. (3) The light absorption of the solution obtained in the Assay exhibits a maximum at 230 nm (Appendix IV A).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve a quantity, accurately weighed, in dehydrated ethanol to produce a solution of 20 µg per ml, measure the absorbance of the solution at 230 nm (Appendix IV A). Calculate the content of $C_5H_9Cl_2N_3O_2$, taking 270 as the value of A (1%, 1 cm) (the operation should be completed within 30 minutes below 20°C).

Category Antineoplastic.

Storage Preserve in hermetically sealed containers, stored in a cool place and protected from light.

Preparation Carmustine Injection

Carmustine Injection

Carmustine Injection is a sterile solution of Carmustine in Macrogol. It contains not less than 90.0% and not more than 110.0% of the labelled amount of carmustine ($C_5H_9Cl_2N_3O_2$).

Description A clear, pale yellow liquid.

Identification Complies with the test for Identification described under Carmustine.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve an accurately weighed quantity in absolute ethanol to produce a solution of 20 µg per ml. Carry out the Assay described under Carmustine.

Category As described under Carmustine.

Strength 2 g : 125 mg

Storage Preserve in well closed containers, protected from light and stored in a cold place.

Carteolol Hydrochloride

$C_{16}H_{24}N_2O_3 \cdot HCl$ 328.84 [51781-21-6]

Carteolol Hydrochloride is 5- [3- (*tert*-Butylamino)-2-hydroxypropoxy]-3,4-dihydrocarbostyryl monohydrochloride. It contains not less than 99.0% of $C_{16}H_{24}N_2O_3 \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder.

Soluble in water; sparingly soluble in methanol; very slightly soluble in ethanol or glacial acetic acid; practically insoluble in ether.

Identification (1) Dissolve about 0.1 g in 5 ml of water, add 5 drops of ammonium reineckate TS; pale red precipitation is produced.

(2) The light absorption of the solution of 8 µg per ml in water exhibits maxima at 215 nm and 252 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of carteolol hydrochloride (Appendix XVI).

(4) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 1.0 g in 100 ml of water, pH 5.0-6.0 (Appendix VI H).

Clarity and colour of solution A solution of 1.0 g in 30 ml of water is clear and colourless.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (50 : 20 : 1) as the mobile phase. Dissolve 0.20 g in 10 ml of methanol, which is used as the test solution. Transfer 2 ml of the solution, accurately measured, to a 100 ml volumetric flask, dilute with methanol to volume and mix well; transfer 1 ml of the solution, accurately measured, to a 10 ml volumetric flask, dilute with methanol to volume and mix well, which is used as the reference solution. Apply separately to the plate 10 µl of each of two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with the test solution is not more intense than the principal spot obtained with the reference solution.

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.5% of its weight (Appendix VIII L), using about 1.0 g.

Residue on ignition Not more than 0.1% (Appendix VIII N), using about 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic To 1.0 g in a crucible pot, add 10 ml of a solution of magnesium nitrate in ethanol (1→50) and ignite gently to ash; wet with a little of nitric acid if any carbide existing and incinerate with strong heat. Cool and dissolve the ash in 3 ml of hydrochloric acid on a water bath; transfer with a little of water to the conical flask, add a drop of methyl orange IS and neutralize with ammonia TS or dilute hydrochloric acid, which is used as the test solution. Carry out the limit test for arsenic (Appendix VIII J, method 2) using 2 ml of arsenic standard solution; not more than 0.0002%.

Assay Dissolve about 0.5 g, accurately weighed, in 30 ml of glacial acetic acid by heating on a water bath, cool and add 70 ml of acetic anhydride. Carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid VS (0.1 mol/L). Perform blank determination and make any necessary correction. Each ml of perchloric acid VS (0.1 mol/L) is equivalent to 32.88 mg of $C_{16}H_{24}N_2O_3 \cdot HCl$.

Category Beta-adrenoceptor antagonist.

Storage Preserve in tightly closed containers.

Preparation Carteolol Hydrochloride Eye Drops

Carteolol Hydrochloride Eye Drops

Carteolol Hydrochloride Eye Drops contain not less than 95.0% and not more than 105.0% of carteolol hydrochloride ($C_{16}H_{24}N_2O_3 \cdot HCl$), with a quantity of benzalkonium chloride as an antimicrobial preservative.

Description A clear, colourless liquid.

Identification (1) The light absorption of the solution of 8 µg per ml exhibits maxima at 215 nm and 252 nm (Appendix IV A).

(2) Dilute a quantity to produce a solution containing about 5 mg of Carteolol Hydrochloride per ml as a test solution. Prepare a reference solution of about 5 mg of carteolol hydrochloride CRS per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (50 : 20 : 1) as the mobile phase but allowing the solvent front to ascend about 12 cm above the line of application. Apply separately to the plate 2 µl of each of above two solutions. After developing and removal of the plate, dry it in air, and examine under ultraviolet light (254 nm). The fluorescent spot in the chromatogram obtained with the test solution corresponds in position and colour to the spot obtained with the reference solution.

pH value pH 6.2-7.2 (Appendix VI H).

Osmolality 0.9-1.1 (Appendix IX G).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Dilute a quantity, accurately measured, with water to produce a solution containing about 16 µg of carteolol hydrochloride per ml. Measure the absorbance of the resulting solution at 252 nm (Appendix IV A). Repeat the operation using carteolol hydrochloride CRS instead of the eye drops. Calculate the content of $C_{16}H_{24}N_2O_3 \cdot HCl$.

Category As described under Carteolol Hydrochloride.

Strength (1) 5 ml : 50 mg (2) 5 ml : 100 mg

Storage Preserve in tightly closed containers.

Cefaclor

$C_{15}H_{14}ClN_3O_4S \cdot H_2O$ 385.82 [53994-73-3]

Cefaclor is (6*R*, 7*R*)-7-[(*R*)-2-Amino-2-phenylacetamido]-3-chloro-8-oxo-5-thia-1-aza-bicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate. It contains not less than 95.0% of $C_{15}H_{14}ClN_3O_4S$, calculated on the anhydrous basis.

Description A white to slightly yellow powder or crystalline powder; odour, slight; taste, bitter. Slightly soluble in water; practically insoluble in methanol, ethanol, chloroform or methylene chloride.

Specific optical rotation +105° to +120°, in a solution of 4 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 20 µg per ml in water at 264 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 230-255.

Identification (1) Dissolve a quantity in water to produce a solution of about 2 mg per ml, filter, using the successive filtrate as solution (1). Dissolve a quantity of cefaclor CRS in water to produce solution (2) of about 2 mg per ml. Dilute a quantity of solution (1) and (2) with water to produce solution (3) of 2 mg per ml respectively. Carry out the method for thin-layer chromatography (Appendix V B), using a freshly prepared mixture of 0.1 mol/L citric acid solution-dipotassium hydrogen phosphate solution (0.1 mol/L) -6.6% solution of ninhydrin in acetone (60 : 40 : 1.5) as the mobile phase. Coat the clean plate with homogeneous slurry of 2.5 g of silica gel H in 8 ml of a 0.1% solution of carboxymethylcellulose sodium, dry it in air and activate at 105°C for 1 hour, allow it to cool in a desiccator. Apply separately to the plate 2 µl each of the three solutions. After developing and removal of the plate, dry it in air and examine. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that obtained with solution (2), and only a principal spot in the chromatogram obtained with solution (3).

(2) The retention time of principal peak of cefaclor in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of cefaclor CRS solution in the chromatogram.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefaclor (Appendix XVI).

(1) or (2) may be used alternatively.

Acidity Dissolve a quantity in water to produce a solution of 25 mg per ml, pH 3.0-4.5 (Appendix VI H).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a 0.78% solution of sodium dihydrogen phosphate (dissolve

7.8 g of sodium dihydrogen phosphate in water and dilute to 1000 ml, adjust pH value to 4.0 with phosphoric acid) as mobile phase A, a mixture of a 0.78% solution of sodium dihydrogen phosphate (pH 4.0) -acetonitrile (55 : 45) as mobile phase B. The flow rate is 1.0 ml/min and detection wavelength is 220 nm. Dissolve a quantity of cefaclor CRS and cefaclor δ-3-isomer CRS in 0.27% solution of sodium dihydrogen phosphate (pH 2.5) to produce a solution of 25 µg separately per ml, inject 20 µl into the column, record the chromatogram. The retention time of peak of cefaclor is about 23-29 minutes. The resolution factor between the peaks of cefaclor and cefaclor δ-3-isomer is not less than 2.0. The tail factor of the column is less than 1.2.

Time (minute)	mobile phase A(%)	mobile phase B(%)
0	95	5
30	75	25
45	0	100
50	0	100
51	95	5
61	95	5

Procedure Dissolve 50 mg, accurately weighed, in a 0.27% solution of sodium dihydrogen phosphate (pH 2.5) in a 10 ml volumetric flask and dilute to volume, shake well, as solution (1). Measure accurately 1 ml into a 100 ml volumetric flask, dilute with the above solvent to volume, mix well as the solution (2). Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 25% of the full scale of the chart. Inject separately 20 µl into the column, record the chromatogram. Each peak area and the sum of the areas of all peaks other than the principal peak are not greater than 1/2 (0.5%) and 2 (2.0%) of area of the principal peak in the chromatogram obtained with solution (2) respectively. Disregard any peak with an area less than 0.1 times area of the principal peak in the chromatogram obtained with solution (2).

Water 3.0%-6.5% (Appendix VIII M, method 1, A).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.003%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of potassium dihydrogen phosphate solution (dissolve 6.8 g of potassium dihydrogen phosphate in water and dilute to 1000 ml, mix well, adjust pH value to 3.4 with phosphoric acid)-acetonitrile (92 : 8) as the mobile phase. The flow rate is 1 ml/min and the detection wavelength is 254 nm. Dissolve an accurately weighed quantity of cefaclor δ-3-isomer CRS and cefaclor CRS in mobile phase to produce a mixed solution of 0.2 mg per ml. Inject 20 µl into the column. The resolution factor between peaks of cefaclor and cefaclor δ-3-isomer complies with the related requirements. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of cefaclor.

Procedure Dissolve 20 mg, accurately weighed, into a 100 ml volumetric flask in mobile phase and dilute to volume to produce a solution of 0.2 mg per ml. Inject 20 µl into the column. Repeat the operation, using cefaclor CRS instead of the substance being examined. Calculate the content of $C_{15}H_{14}ClN_3O_4S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosporin.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Cefaclor Capsules
(2) Cefaclor Granules
(3) Cefaclor for Suspension
(4) Cefaclor Tablets

Cefaclor Capsules

Cefaclor Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$).

Description Capsules containing almost white to slightly yellow powder.

Identification Dissolve a quantity of the contents of the capsules in water to produce a solution of about 2 mg of cefaclor per ml and filter. The successive filtrate complies with tests (1) and (2) for Identification described under Cefaclor.

Water Not more than 8.0% (Appendix VIII M, method 1 A), using a quantity of the contents of the capsules.

Dissolution Carry out the dissolution test (Appendix X C method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution at 30 minutes, filter. Dilute an accurately measured quantity of the successive filtrate with water to produce a solution of 25 μ g per ml. Dissolve an accurately weighed quantity of the mixed contents in the test for weight variation of contents in water to produce a reference solution of 25 μ g of cefaclor ($C_{15}H_{14}ClN_3O_4S$) per ml according to the labelled amount. Measure the absorbance of the resulting solutions at 264 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{14}ClN_3O_4S$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Related substances Carry out the method as described under Cefaclor, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 500 mg of cefaclor. Dissolve the cefaclor in 0.27% solution of sodium dihydrogen phosphate (pH 2.5) and dilute to volume in a 100 ml volumetric flask, mix well and filter, use the successive filtrate as the test solution. Dilute 1 ml of the filtrate with a 0.27% solution of sodium dihydrogen phosphate (pH 2.5) to volume in a 100 ml volumetric flask to volume, mix well as the reference solution. Each peak area of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than that of the principal peak in the chromatogram obtained with the reference solution respectively (1.0%).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed contents in the test for weight variation of contents equivalent to about 100 mg of cefaclor in mobile phase to produce a solution of 0.2 mg of cefaclor per ml, mix well and filter. Inject 20 μ l of the successive filtrate into the column, carry out the Assay under Cefaclor.

Category As described under Cefaclor.

Strength 0.25 g (calculated as $C_{15}H_{14}ClN_3O_4S$)

Storage Preserve in tightly closed containers, stored in a

cool, dry and dark place and protected from light.

Cefaclor Granules

Cefaclor Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$).

Description Suspension granules; odour, fragrant; taste, sweet.

Identification Dissolve a quantity in water to produce a solution of about 2 mg of cefaclor per ml, filter, the successive filtrate complies with the tests (1) or (2) for Identification described under Cefaclor.

Acidity A suspension of 25 mg of cefaclor per ml in water, pH 3.0-5.0 (Appendix VI H).

Water Not more than 3.0% (Appendix VIII M, method 1 A).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve an accurately weighted quantity of the mixed contents obtained in the test for weight variation equivalent to about 100 mg of cefaclor in mobile phase and dilute to produce a solution of 0.2 mg of cefaclor per ml (sonicate when necessary), filter, inject 20 μ l of successive filtrate into the column, carry out the Assay described under Cefaclor.

Category As described under Cefaclor.

Strength Calculated as $C_{15}H_{14}ClN_3O_4S$
(1) 0.1 g (2) 0.125 g (3) 0.25 g

Storage Preserve in tightly closed containers, stored in a cool, dry and dark place and protected from light.

Cefaclor for Suspension

Cefaclor for Suspension contains not less than 90.0% and not more than 110.0% of the labelled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$).

Description Fine particle or powder; odour, fragrant; taste, sweet.

Identification Dissolve a quantity in water to produce a solution of about 2 mg of cefaclor per ml, filter, the successive filtrate complies with the tests (1) or (2) for Identification described under Cefaclor.

Acidity A suspension solution of 25 mg per ml in water, pH 3.0-5.0 (Appendix VI H).

Related substances Carry out the method as described under Cefaclor. Using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents equivalent to about 500 mg of cefaclor. Dissolve the cefaclor in 0.27% solution of sodium dihydrogen phosphate (pH 2.5) and dilute to volume in a 100 ml volumetric flask, mix well and filter use the successive filtrate as the test solution. Dilute 1 ml of the filtrate with a 0.27% solution of sodium dihydrogen phosphate (pH 2.5) to volume in a 100 ml volumetric flask to volume mix well as the reference solution. Each peak area of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater twice than that of the principal peak in the

chromatogram obtained with the reference solution respectively (2%).

Water Not more than 2.0% (Appendix VIII M, method 1, A).

Other requirements Complies with the general requirements for suspensions (Appendix I O).

Assay Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation equivalent to about 100 mg of cefaclor in mobile phase and dilute to produce a solution of 0.2 mg of cefaclor per ml (ultrasonic treatment when necessary), filter, inject 20 μ l of successive filtrate into the column, carry out the Assay described under Cefaclor.

Category As described under Cefaclor.

Strength Calculated as $C_{15}H_{14}ClN_3O_4S$
(1) 0.125 g (2) 1.5 g

Storage Preserve in tightly closed containers, stored in a cool, dry and dark place and protected from light.

Cefaclor Tablets

Cefaclor Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of cefaclor ($C_{15}H_{14}ClN_3O_4S$).

Description Film coated tablets with white to slightly yellow core.

Identification To a quantity of powdered tablets add water to produce a solution of about 2 mg of cefaclor per ml and filter. The successive filtrate complies with tests (1) or (2) for Identification described under Cefaclor.

Water Not more than 8.0% (Appendix VIII M, method 1 A) using a quantity of powdered tablets.

Dissolution Carry out the dissolution test (Appendix X C method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution at 30 minutes, filter. Dilute an accurately measured quantity of the successive filtrate with water to produce a solution of 25 μ g per ml. Powder finely 10 tablets. Dissolve an accurately weighed quantity of the powdered tablets in water to produce a reference solution of 25 μ g of cefaclor ($C_{15}H_{14}ClN_3O_4S$) per ml according to the labelled amount. Measure the absorbance of the resulting solutions at 264 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{14}ClN_3O_4S$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Related substances Carry out the Related substances under cefaclor using an accurately weighed quantity equivalent to about 500 mg of cefaclor of the mixed contents obtained from the test for Assay. Dissolve the cefaclor in 0.27% solution of sodium dihydrogen phosphate (pH 2.5) and dilute to volume in a 100 ml volumetric flask, mix well and filter use the successive filtrate as the test solution. Dilute 1 ml of the filtrate with a 0.27% solution of sodium dihydrogen phosphate (pH 2.5) to volume in a 100 ml volumetric flask to volume mix well as the reference solution. Each peak area of all peaks other than the principal peak in the chromatogram obtained with the test solution is not greater than that of the principal peak in the chromatogram obtained with the reference solution respectively (1.0%).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Dissolve an accurately weighed quantity equivalent to about 100 mg of cefaclor in mobile phase to produce a solution of 0.2 mg of cefaclor per ml, mix well and filter. Inject 20 μ l of the successive filtrate into the column, carry out the Assay described under Cefaclor.

Category As described under Cefaclor.

Strength 0.25 g (Calculated as $C_{15}H_{14}ClN_3O_4S$)

Storage Preserve in tightly closed containers, stored in a cool, dry and dark place, and protected from light.

Cefadroxil

$C_{16}H_{17}N_3O_5S \cdot H_2O$ 381.41 [66592-87-8]

Cefadroxil is (6R, 7R)-3-methyl-7-[(R)-2-amino-2-(4-hydroxyphenyl)acetamido]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid monohydrate. It contains not less than 95.0% of $C_{16}H_{17}N_3O_5S$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odour characteristic. Slightly soluble in water; practically insoluble in ethanol, chloroform or ether.

Specific optical rotation $+165^\circ$ to $+178^\circ$, in a solution of 6 mg per ml in water (Appendix VI E).

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefadroxil CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefadroxil (Appendix XVI).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity Dissolve a quantity in water to produce a solution of 5 mg per ml, pH 4.0-6.0 (Appendix VI H).

Related substances Dissolve an accurately weighed quantity in mobile phase to produce a solution of 0.7 mg per ml as the test solution. Measured accurately 1 ml to an 100 ml volumetric flask, add mobile phase to volume and mix well, as the reference solution. Dissolve a quantity of 7-aminodesacetoxy cephalosporanic acid CRS and α -p-hydroxyphenylglycine CRS in mobile phase to produce a mixed impurity solution of 7 μ g per ml respectively. Carry out the method as described under Assay. Inject 10 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject 10 μ l of the test solution, the reference solution and the mixture impurity solution into the column and record the chromatograms for three times retention time of the principal peak in the test solution. Calculate the content of 7-aminodesacetoxy cephalosporanic acid and α -p-hydroxyphenylglycine with respect to the peak area in the chromatogram obtained with test solution by the external standard method, both are not more than 1.0%. Other single peak area other

than the principle peak is not more than the peak area of cefadroxil in the reference solution (1.0%). The total peaks area other than the principle peak are not more than three times the peak area of cefadroxil in the reference solution (3.0%). (disregard any peak with an area less than 0.05 times area of the principal peak in the chromatogram obtained with the reference solution).

Water 4.2%-6.0% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution (adjust to pH 5.5 with 10 mol/L sodium hydroxide solution)-acetonitrile (96 : 4) as mobile phase. Detection wavelength is 230 nm. Dissolve a quantity of cefadroxil CRS and 7-aminodesacetoxy cephalosporanic acid CRS in mobile phase to produce a mixed solution of 0.5 mg of cefadroxil and 10 µg of 7-aminodesacetoxy cephalosporanic acid per ml. Inject 10 µl of the mixture solution into the column and record the chromatogram. The ratio of retention time between the peak of cefadroxil and that of the 7-aminodesacetoxy cephalosporanic acid is not less than 2.0.

Procedure Dissolve an accurately weighed quantity in the mobile phase to produce a solution of 0.3 mg per ml, inject 10 µl into the column. Repeat the operation, using cefadroxil CRS instead of the substance being examined, calculate the content of $C_{16}H_{17}N_3O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β-lactam antibiotic, cephalosporins.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation (1) Cefadroxil Capsules
(2) Cefadroxil Granules
(3) Cefadroxil Tablets

Cefadroxil Capsules

Cefadroxil Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefadroxil ($C_{16}H_{17}N_3O_5S$).

Description Capsules containing white or almost white powder or granule.

Identification The contents of the capsules comply with the test (1) for Identification described under Cefadroxil.

Related substances Dissolve a quantity of the contents in mobile phase to produce a solution of 0.7 mg per ml, filter and use the successive filtrate as the test solution. Carry out the Related substances described under Cefadroxil.

Water Not more than 8.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 30 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of 25 µg per ml. Dissolve an accurately weighed quantity, equivalent to about the average weight in each capsule, of the mixed contents in the test for weight variation of contents in water to produce a solution of 25 µg per ml calculated by the labelled amount. Measure the absorbance of the resulting solutions separately at 263 nm

(Appendix IV A). Calculate the dissolution of $C_{16}H_{17}N_3O_5S$ from each capsule. Not less than 80% is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To an accurately weighed quantity, equivalent to about 30 mg of cefadroxil, of the mixed content obtained from weight variation of contents add mobile phase and dilute to volume in a 100 ml volumetric flask, shake thoroughly and filter. Carry out the Assay described under cefadroxil, using an accurately measured 10 µl of successive filtrate.

Category As described under Cefadroxil.

Strength Calculated as $C_{16}H_{17}N_3O_5S$
(1) 0.125 g (2) 0.25 g (3) 0.5 g

Storage Preserve in tightly closed containers, protected from light and stored in a cool and dark place.

Cefadroxil Granules

Cefadroxil Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefadroxil ($C_{16}H_{17}N_3O_5S$).

Description Soluble granules; taste, sweet.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak of cefadroxil CRS in the chromatogram of the reference solution.

Acidity A solution of 50 mg per ml in water, pH 4.5-6.0 (Appendix VI H).

Related substances Dissolve a quantity of the powder as described under Assay in mobile phase to produce a solution of 0.7 mg per ml Cefadroxil, filter and use the successive filtrate as test solution. Carry out the Related substance described under cefadroxil. Calculate the content of 7-aminodesacetoxy cephalosporanic acid and α-p-hydroxy-phenylglycine with respect to the peak area obtained in the chromatogram of test solution by the external standard method, the both are not more than 1.0%. Other single peak area other than the principle peak is not more than the peak area of cefadroxil in the reference solution (1.0%). (disregard any peak with an area less than 0.05 times area of the principal peak in the chromatogram obtained with reference solution).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Carry out the Assay described under Cefadroxil, using an accurately weighed quantity, equivalent to about 30mg of Cefadroxil, of the mixed contents obtained in the test for weight variation of contents. Dissolve the Cefadroxil in the mobile phase and dilute to volume in an 100 ml volumetric flask, mix well, and filter. Inject 10 µl of the successive filtrate into the column.

Category As described under Cefadroxil.

Strength 0.125 g (calculated as $C_{16}H_{17}N_3O_5S$)

Storage Preserve in tightly closed container and store in a cool place.

Cefadroxil Tablets

Cefadroxil tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Cefadroxil ($C_{16}H_{17}N_3O_5S$).

Description White or almost white tablets.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefadroxil CRS.

Related substances Dissolve a quantity of the powder in mobile phase to produce a solution of 0.7 mg per ml, filter and use the successive filtrate as the test solution. Carry out the Related substances described under Cefadroxil.

Dissolution Comply with the requirements for dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution at 30 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with water to produce a solution of 25 μ g per ml. Powder 10 tablets and weigh accurately a quantity of the powder equivalent to average weight, and dissolve with water to produce a solution of 25 μ g per ml calculated by the labelled amount. Measure the absorbances of the resulting solutions at 263 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{17}N_3O_5S$ from each tablet. Not less than 75% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Powder 10 tablets, accurately weighed, and dissolve a quantity of the powder accurately weighed, equivalent to about 30 mg of cefadroxil, in the mobile phase and dilute to volume in a 100 ml volumetric flask, mix well, and filter. Carry out the Assay described under Cefadroxil. Inject 10 μ l of the successive filtrate into the column.

Category As described under Cefadroxil.

Strength calculated as $C_{16}H_{17}N_3O_5S$ (1) 0.125 g
(2) 0.25 g

Storage Preserve in tightly closed container and store in a cool place.

Cefalexin

$C_{16}H_{17}N_3O_4S \cdot H_2O$ 365.41 [23325-78-2]

Cefalexin is the monohydrate of (6*R*, 7*R*)-[(aminophenylacetyl) amino]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. It contains not less than 95.0% of $C_{16}H_{17}N_3O_4S$, calculated on the anhydrous basis.

Description A white to slightly yellow crystalline powder; odour, slight.

Slightly soluble in water; insoluble in ethanol, chloroform or ether.

Specific optical rotation +149° to +158°, in a solution of 5 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 20 μ g per ml in water at 262 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 220-245.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefalexin CRS. (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefalexin (Appendix XVI).

Acidity Dissolve 50 mg in 10 ml of water, pH 3.5-5.5 (Appendix VI H).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-0.01 mol/L sodium acetate solution (adjusting pH to 5.0 with glacial acetic acid)-methanol (21 : 55 : 24) as the mobile phase. Detection wavelength is 220 nm. Dissolve a quantity of the substance being examined, accurately weighed, in the mobile phase to produce solutions of 0.4 mg per ml (solution 1) and 4 μ g per ml (solution 2). Dissolve 10 mg each of 7-aminodesacetoxycephalosporanic acid CRS and α -phenylglycine CRS, accurately weighed, in a 100 ml volumetric flask, add 4 ml of 7.3% hydrochloric acid solution, sonicate to dissolve, dilute to volume with the mobile phase and mix well. Dilute 2.0 ml to volume with the mobile phase in a 50 ml volumetric flask, mix well (solution 3). Inject 20 μ l of solution (3) into the column, the resolution factor between the peaks of 7-aminodesacetoxycephalosporanic acid and α -phenylglycine complies with the related requirements. Inject 20 μ l of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 20 μ l each of solution (1) (2) and (3), and record the chromatogram for twice the retention time of the principal peak. The contents of 7-aminodesacetoxycephalosporanic acid and α -phenylglycine calculated with respect to the peak areas obtained with solution (1) by the external standard method are separately not more than 1.0%, and any other peak area and the sum areas of other peaks other than principal peak are not greater than 1.5 times and 2.5 times the principal peak area in the chromatogram obtained with solution (2) respectively. Disregard any peak with an area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).

Water 4.0%-8.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-methanol-3.86% sodium acetate solution-4% acetic acid solution (742 : 240 : 15 : 3) as the mobile phase. The value of *g* (the number of theoretical plates of the column) is not less than 1500, calculated with reference to the peak of cefalexin.

Procedure Dissolve about 50 mg, accurately weighed, in the mobile phase in a 50 ml volumetric flask and dilute to volume, mix well. Transfer 10 ml of the solution into a 50 ml volumetric flask, dilute with the mobile phase to volume and mix well, inject 10 μ l into the column. Repeat the operation, using cefalexin CRS instead of the substance being examined, calculate the content of $C_{16}H_{17}N_3O_4S$.

Category β -Lactam antibiotic, Cephalosporin.

Storage Preserve in tightly closed containers, stored in a dark and cool place and protected from light.

Preparation (1) Cefalexin Capsules
(2) Cefalexin Granules
(3) Cefalexin for Suspension
(4) Cefalexin Tablets

Cefalexin Capsules

Cefalexin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefalexin ($C_{16}H_{17}N_3O_4S$).

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefalexin CRS.

Related substances Dissolve a quantity of the contents of capsules in the mobile phase to produce a solution of 0.4 mg per ml, filter and use the successive filtrate as the test solution. Carry out the method described under Cefalexin. The contents of 7-aminodesacetoxycephalosporanic acid and α -phenylglycine calculated with respect to the peak areas by the external standard method are separately not more than 1.0%, and any other peak area and the sum areas of other peaks other than principal peak are not greater than twice and 3 times of the principal peak area in the chromatogram obtained with solution (2) respectively. (Disregard any peak with an area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).)

Water Not more than 9.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 45 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of 25 μ g per ml. Dissolve an accurately weighed quantity of cefalexin CRS in water and dilute with the same solvent to produce a solution of 25 μ g per ml. Measure the absorbances of the resulting solutions respectively at 262 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{17}N_3O_4S$ from each capsule. Not less than 80% is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay To an accurately weighed quantity, equivalent to about 0.1 g of cefalexin, of the mixed content obtained in weight variation of contents, add a quantity of the mobile phase and shake thoroughly to dissolve cefalexin in a 100 ml volumetric flask. Dilute with the mobile phase to volume, mix well and filter. Transfer an accurately measured 10 ml of successive filtrate to a 50 ml volumetric flask, dilute with the mobile phase to volume, mix well. Carry out the Assay described under cefalexin, using 10 μ l of the resulting solution.

Category As described under Cefalexin.

Strength Calculated as $C_{16}H_{17}N_3O_4S$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light and stored in a dark and cool place.

Cefalexin Granules

Cefalexin Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefalexin ($C_{16}H_{17}N_3O_4S$).

Description Soluble granules.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefalexin CRS.

Acidity A suspension of 25 mg per ml in water, pH 4.0-6.0 (Appendix VI H).

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay To an accurately weighed quantity, equivalent to about 0.1 g of cefalexin, of the mixed content obtained in weight variation of contents add a quantity of mobile phase and shake thoroughly to dissolve cefalexin in a 100 ml volumetric flask. Dilute with the mobile phase to volume, mix well and filter. Transfer an accurately measured 10 ml of successive filtrate to a 50 ml volumetric flask, dilute with mobile phase to volume, mix well. Carry out the Assay described under Cefalexin, using 10 μ l of the resulting solution.

Category As described under Cefalexin.

Strength Calculated as $C_{16}H_{17}N_3O_4S$
(1) 50 mg (2) 125 mg

Storage Preserve in tightly closed containers, protected from light, store in a dark and cool place.

Cefalexin for Suspension

Cefalexin for suspension contains not less than 90.0% and not more than 110.0% of the labelled amount of cefalexin ($C_{16}H_{17}N_3O_4S$).

Description powder, odour fragrant, taste, sweet.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefalexin CRS.

Acidity A suspension of 25 mg per ml in water, pH 4.0-6.0 (Appendix VI H).

Ratio of sedimental volume Carry out the test for ratio of sedimental volume (Appendix I O), add water according to the ratio of administration and shake for 1 minute, allow to stand for 45 minutes (for multidose). The result should comply with the requirements.

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Other requirements Complies with the general requirements for suspension (Appendix I O).

Assay Carry out the Assay described under Cefalexin, using an accurately weighed quantity, equivalent to about 50 mg of Cefalexin, of the mixed contents obtained from the test for weight variation of contents. Dissolve the cefalexin in the mobile phase and dilute to volume in a 50 ml volumetric flask, mix well, and filter. Dilute 10 ml of the successive

filtrate with the mobile phase to the volume in a 50 ml volumetric flask. Inject 10 μ l of the successive filtrate into the column.

Category As described under Cefalexin.

Strength Calculated as $C_{16}H_{17}N_3O_4S$ (1) 0.5 g (2) 1.5 g

Storage Preserve in tightly closed containers, protected from light and store in a dark and cool place.

Cefalexin Tablets

Cefalexin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of cefalexin ($C_{16}H_{17}N_3O_4S$).

Description White tablets or Sugar or film coated tablets with white or creamy yellow cores.

Identification The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cefalexin CRS.

Related substances Dissolve a quantity of the powdered tablets in the mobile phase to produce a solution of 0.4 mg per ml. Filter and use the successive filtrate as the test solution. Carry out the method described under Cefalexin. The contents of 7-aminodesacetoxycephalosporanic acid and α -phenylglycine calculated with respect to the peak areas obtained with solution (1) by the external standard method are separately not more than 1.0%, and any other peak area and the sum areas of other peaks other than principal peak are not greater than twice and 3 times of the principal peak area in the chromatogram obtained with solution (2) respectively. Disregard any peak with an area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution at 45 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of 25 μ g per ml. Weigh and powder 10 tablets. Dissolve a quantity, equivalent to about the average weight in each tablet, of the powder in water to produce a solution of 1 mg per ml calculated by the labelled amount. Filter, dilute an accurately measured quantity of the successive filtrate in water to produce a solution of 25 μ g per ml. Measure the absorbance of the resulting solutions separately at 262 nm (Appendix IV A), calculate the dissolution of $C_{16}H_{17}N_3O_4S$ from each tablet. Not less than 80% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. To an accurately weighed quantity, equivalent to about 0.1 g of cefalexin, add a quantity of mobile phase and shake thoroughly to dissolve cefalexin in a 100 ml volumetric flask. Dilute with the mobile phase to volume, mix well and filter. Transfer an accurately measured 10 ml of successive filtrate to a 50 ml volumetric flask, dilute with the mobile phase to volume, mix well. Carry out the Assay described under cefalexin, using 10 μ l of the resulting solution.

Category As described under Cefalexin.

Strength Calculated as $C_{16}H_{17}N_3O_4S$
(1) 0.125 g (2) 0.25 g (3) 0.5 g

Storage Preserve in tightly closed containers, protected from light and stored in a dark and cool place.

Cefalotin Sodium

$C_{16}H_{15}N_2NaO_6S_2$ 418.43

[58-71-9]

Cefalotin Sodium is sodium (6R, 7R)-3-(hydroxymethyl)-8-oxo-7-[2-(2-thienyl) acetamido]-5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylate acetate (ester). It contains not less than 90.0% of $C_{16}H_{15}N_2O_6S_2$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; almost odourless.

Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Specific optical rotation +124° to +134° at 25°C, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of the principal peak of the substance solution being examined in the chromatogram obtained in Assay is identical with that of cefalotin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefalotin sodium (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of 0.1 g per ml, pH 4.5-7.0 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 0.6 g add 5 ml of water respectively the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₅ or YG₅ (Appendix IX A, method 1).

Light absorption The absorbance of a solution of 20 μ g per ml in water at 237 nm (Appendix IV A) is 0.65-0.72.

Related substances Dissolve a quantity in mobile phase to produce solution (1) containing 1.0 mg per ml; measure accurately 1 ml to a 100 ml volumetric flask, dilute with mobile phase to volume, mix well as solution (2). Carry out the method as described under Assay. Inject 10 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale of the chart. Inject immediately 10 μ l of the two solutions respectively into the column and record the chromatograms for four times the retention time of the principal peak. Each peak area other than principal peak in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2); the sum of the areas of all peaks other than principal peak in the chromatogram obtained with solution (1) is not greater than 3 times area of the principal peak in the chromatogram obtained with solution (2) respectively. Disregard any peak with an area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).

Water Not more than 1.2% (Appendix VIII M, method 1 A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of solution of 50 mg per ml in sterile Water for Injection per kg of rabbit's weight.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method). Dissolve a quantity in a suitable solution, and then transfer it into not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetate buffer (Dissolve 21.5 g of sodium acetate in water and add water to produce 1000 ml, adjust to pH 5.9 ± 0.1 with glacial acetic acid)-acetonitrile-ethanol (790 : 150 : 70) as mobile phase. The temperature of column is 40°C. The detection wavelength is 254 nm. Heat 5 ml of cefalotin CRS solution in a water bath at 90°C for 10 minutes to produce desacetylcephalothin and cool to room temperature, inject immediately 10 μ l into the column. Adjust the attenuation so that the peak height of desacetylcephalothin in the chromatogram is about 50% of full scale of the chart. The resolution factor between peaks of cefalotin and desacetylcephalothin is not less than 9.0, the tailing factor of the peak of cefalotin is not more than 1.8.

Procedure Dissolve a quantity, accurately weighed, in mobile phase to produce a solution of 1 mg of cefalotin per ml. Inject 10 μ l into the column and record the chromatogram. Repeat the operation, using cefalotin CRS instead of the substance being examined, calculate the content of $C_{16}H_{16}N_2O_6S_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, Cephalosporin.

Storage Preserve in hermetically sealed containers, stored in a cool, dry and dark place.

Preparation Cefalotin Sodium for Injection

Cefalotin Sodium for Injection

Cefalotin Sodium for Injection is a sterile powder of Cefalotin Sodium. It contains not less than 90.0% of cefalotin ($C_{16}H_{16}N_2O_6S_2$), calculated on the anhydrous basis. It contains not less than 95.0% and not more than 105.0% of the labelled amount of cefalotin ($C_{16}H_{16}N_2O_6S_2$), calculated with reference to the average weight of contents.

Description A white or almost white crystalline powder.

Identification Complies with the tests for Identification described under Cefalotin Sodium.

Clarity and colour of solution To 5 containers add water to produce solutions of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₈ or YG₈ (Appendix IX A, method 1).

Related substances Using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents, mixed well, carry out the test for Related substances described under cefalotin. Each peak area other than principle area in the chromatogram is not greater than the area of the principal peak in the chromatogram obtained with the reference solution; the sum of the area of all peaks other than principal area in the chromatogram is not greater than 3 times of area of the principal peak in the

chromatogram obtained with the reference solution respectively, disregard any peak with an area less than 0.05 times area of the principal peak in the chromatogram obtained with the reference solution.

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Acidity, Pyrogens and Sterility Complies with the requirements described under Cefalotin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B), except that the weight variation of contents is not more than $\pm 7.0\%$.

Assay Carry out the Assay described under Cefalotin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Cefalotin Sodium.

Strength Calculated as $C_{16}H_{16}N_2O_6S_2$
(1) 0.5 g (2) 1 g

Storage Preserve in tightly closed containers, stored in a cool, dry and dark place.

Cefathiamidine

$C_{19}H_{28}N_4O_6S_2$ 472.5 g

Cefathiamidine is (6*R*, 7*R*) -3 [(Acetyl) methyl] -7- α -(*N*, *N*'-diisopropylamidinothio)-acetamido]-8-oxo-5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylic acid, inner salt. It contains not less than 97.0% of $C_{19}H_{28}N_4O_6S_2$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; almost odourless; hygroscopic. Very soluble in water; slightly soluble in ethanol; insoluble in acetone, chloroform or ether.

Specific optical rotation $+135^\circ$ to $+145^\circ$, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in Assay is identical with that of cefathiamidine CRS.

(2) Carry out the method for thin-layer chromatography (Appendix V B) using a freshly prepared mixture of methanol-isopropanol-phosphate BS (pH 5.8) (7 : 2 : 1) filtered as mobile phase. Coat the clean plate with homogeneous slurry of 2.5 g of silica gel G mixed in a 1% phosphate BS (pH 5.8) containing carboxymethylcellulose sodium. Dry in air and activate at 105°C for 1 hour, and allow it to cool in a desiccator. Apply separately to the plate 1 μ l each of three solutions (1) containing 20 mg per ml of the substance being examined in water (2) containing 20 mg per ml of cefathiamidine CRS in water (3) obtained by mixing equal quantity of solution (1) and solution (2). After developing and removal of the plate, dry it in air and heat it at 100°C for 30 minutes. Expose it to iodine vapor and examine. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that obtained with solution (2), and only a principal spot in

the chromatogram obtained with solution (3).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefathiamidine (Appendix XVI).

Test (1) or (2) may be used alternatively.

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity Dissolve a quantity in water to produce a solution of 0.1 g per ml. pH 4.0-6.0 (Appendix VI H).

Clarity and colour of solution Dissolve each of 5 portions in water to produce solution containing 0.1 g per ml respectively. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX A); any colour produced is not more intense than that of reference solution Y₆ or YG₆ (Appendix IX A, method 1).

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Related substances Carry out the method as described under Assay. Dissolve a quantity in water to produce solution (1) containing 0.5 mg per ml and solution (2) containing 5 µg per ml respectively. Inject 10 µl of solution (2) into the column. Adjust the attenuation so that the principal peak height in chromatogram is about 20% of full scale of the chart. Inject separately 10 µl into the column and record the chromatograms for four times retention time of the principal peak. The sum of the area of all peaks other than principal peak in the chromatogram obtained with solution (1) is not greater than 2.5 times area of the principal peak in the chromatogram obtained with solution (2) (not more than 2.5%). Each peak area in the chromatogram obtained with solution (1) other than principal peak is not greater than that of the principal peak in the chromatogram obtained with solution (2) (not more than 1.0%). Disregard any peak with the area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).

Residual solvent Carry out the method for residual solvents (Appendix VIII P). The gas chromatograph is equipped with a flame-ionization detector, a capillary column packed with 6% cyanopropylphenyl and 94% dimethyl silicone (or stationary phase with similar polarity), maintaining the temperature of the column at 30°C. The injection port and the detector are maintained at 140°C and 250°C respectively, inject 1.0 µl. The resolution factor between the principal peaks complies with the related requirements.

Reference standard solution To a quantity of dichloromethane, acetone and ethanol, add water to produce a solution containing 0.03 mg of dichloromethane per ml, 0.25 mg of acetone per ml, and 0.25 mg of ethanol per ml.

Procedure: Dissolve 0.1 g of substance being examined, accurately weighed, in 2 ml of water. Inject 10 µl into the column, record the chromatogram. Repeat the operation, using 1.0 µl of reference standard solution. Calculate the contents with respect to the peak area obtained in the chromatogram by external standard method. The content of dichloromethane is not more than 0.06%, the content of ethanol and acetone is not more than 0.5%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.075 EU per mg of cefathiamidine.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in sterile water and dilute with not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid

chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate BS (Dissolve 2.76 g of anhydrous disodium hydrogen phosphate and 1.29 g of citric acid in 1000 ml of water)-acetonitrile (80 : 20) as the mobile phase. Detector wavelength is 254 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of cefathiamidine.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 0.1 mg per ml. Inject 10 µl into the column and record the chromatogram. Repeat the operation, using cefathiamidine CRS instead of the substance being examined. Calculate the content of C₁₉H₂₈N₄O₆S₂ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β-lactam antibiotic, cephalosporin.

Storage Preserve in tightly closed containers, stored in a cool, dry and dark place and protected from light.

Preparation Cefathiamidine Sodium for Injection

Cefathiamidine for Injection

Cefathiamidine for Injection is a sterile powder of Ceftezole Sodium. It contains not less than 97.0% of C₁₉H₂₈N₄O₆S₂, calculated on the anhydrous basis. It contains not less than 90.0% and not more than 110.0% of the labelled amount of cefathiamidine (C₁₉H₂₈N₄O₆S₂), calculated with reference to the average weight of contents.

Description A white to slightly yellow crystalline powder; almost odourless; hygroscopic.

Identification Complies with the tests for Identification described under Cefathiamidine.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₇ or YG₇ (Appendix IX A, method 1).

Water Not more than 2.0% (Appendix VIII M, method 1 A).

Related substance Carry out the method described under Cefathiamidine, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents. The sum of the areas of all peaks other than principal peak in the chromatogram obtained with solution (1) is not greater than three times area of the principal peak in the chromatogram obtained with solution (2) (not more than 3.0%). Each peak area in the chromatogram obtained with solution (1) other than principal peak is not greater than that of the principal peak in the chromatogram obtained with solution (2) respectively (not more than 1.0%). Disregard any peak with the area less than 0.05 times area of the principal peak in the chromatogram obtained with solution (2).

Crystallinity, Acidity, Bacterial endotoxin and Sterility Complies with the requirements described under Cefathiamidine.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under cefathiamidine, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under cefathiamidine.

Strength 0.5 g

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Cefazolin Sodium

$C_{14}H_{13}N_5NaO_4S_3$ 476.50

[27164-46-1]

Cefazolin Sodium is sodium (6*R*, 7*R*)-3-[[[(5-methyl-1,3,4-thiadiazol-2-yl) thio] methyl]-7-[(1*H*-tetrazol-1-yl) acetamido]-8-oxo-5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylate. It contains not less than 86.0% of $C_{14}H_{13}N_5O_4S_3$, calculated on the anhydrous basis.

Description A white or almost white powder or crystalline powder; odourless; taste slightly bitter; hygroscopic. Freely soluble in water; slightly soluble in methanol; insoluble in ethanol, acetone or benzene.

Specific optical rotation -15° to -24° , in a solution of 50 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of an aqueous solution of 16 μ g per ml at 272 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 264-292.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(2) To a quantity of the substance being examined add water to produce a solution of 16 μ g per ml. The light absorption of the solution exhibits a maximum at 272 nm (Appendix IV A).

(3) Yields the flame reaction of sodium salts (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of 0.1 g per ml, pH 4.5-6.5 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 0.6 g add 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₃ or YG₃ (Appendix IX A, method 1).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. Using phosphate buffer solution (weigh disodium hydrogen phosphate R ($Na_2HPO_4 \cdot 12H_2O$) 2.91 g and potassium dihydrogen phosphate 0.71 g and dissolve with water and dilute to 1000 ml) as mobile phase A and using acetonitrile as mobile phase B. The flow rate is 1.2 ml/min. The wavelength of detector is 254 nm. The column temperature is 45°C. The gradient elution is performed linearly as followed. Dissolve about 10 mg in 10 ml of 0.2% sodium

hydroxide solution. Allow to stand for 15-30 minutes. Accurately measure 1.0 ml of the solution and dilute to 10 ml with mobile phase A. Mix well and use as system suitability solution. Inject 10 μ l into the column. The resolution factor between the cefazolin peak and the adjacent peaks comply with requirements. Inject 10 μ l of reference solution into column. Adjust attenuation so that the cefazolin peak height in the chromatogram is about 20% of full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase A to produce a solution of 2.5 mg per ml used as test solution. Accurately measure 1.0 ml of test solution and dilute to 100 ml with mobile phase A used as reference solution. Inject 10 μ l of test solution and reference solution respectively into column and record the chromatogram. Any peak area other than the principal peak is not greater than the cefazolin peak in the chromatogram obtained with the reference solution (1.0%). The sum of the areas of all peaks other than the principal peak is not greater than 3.5 times of the sum areas of the cefazolin peak in the chromatogram obtained with the reference solution (3.5%). (Disregard any peak with an area less than 0.05 times that of the sum area of the cefazolin peak in the chromatogram obtained with reference solution.)

Time(minute)	mobile phase A(%)	mobile phase B(%)
0	98	2
2	98	2
4	85	15
10	60	40
11.5	35	65
12	35	65
15	98	2
21	98	2

Cefazolin polymer Carry out the method for size exclusion chromatography (Appendix V H), using a column 1.3-1.6 cm in internal diameter, 30-40 cm in column length, packed with sephadex G-10 (40-120 μ m), using 0.1 mol/L phosphate BS (pH 7.0) [a mixed solution of 0.1 mol/L disodium hydrogen phosphate and 0.1 mol/L sodium dihydrogen phosphate (61 : 39)] as the eluent A and water as the eluent B with a flow rate 1.5 ml per minute. Detection wavelength is 254 nm. Inject 200 μ l of 0.1 mg/ml blue dextran 2000 solution, using eluent A and eluent B as mobile phase separately, the number of theoretical plates is not less than 700, calculated with reference to blue glucosan 2000, and the tailing factors are not more than 2.0. The ratio of the retention time of blue dextran 2000 peak in eluent A to eluent B should be between 0.93 and 1.07. The ratio of the retention time of the principle peak of reference solution and the polymer peak of test solution to blue dextran 2000 peak of the corresponding system should be between 0.93 and 1.07. Using eluent B as mobile phase, inject accurately 200 μ l of reference solution into column. The relative standard deviation (RSD) for replicate injections of reference solution is less than 5.0%.

Reference solution Dissolve about 20 mg of cefazolin CRS, accurately weighed, in water and dilute to produce a solution of 10 μ g per ml.

Procedure Dissolve about 0.2 g, accurately weighed, in water and dilute to volume in a 10 ml volumetric flask, mix well. Inject 200 μ l of the resulting solution into the column

immediately, using eluent A as mobile phase and record the chromatogram. Inject accurately 200 μ l of the reference solution, using eluent B as mobile phase and record the chromatogram. Calculate the content of cefazolin polymer with reference to cefazolin with respect to the peak area obtained in the chromatogram by the external standard method; not more than 0.03%.

Water Not more than 2.5% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.1 EU per mg of cefazolin.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of disodium hydrogen phosphate citric acid solution (Dissolve 1.33 g of anhydrous disodium hydrogen phosphate and 1.12 g of citric acid in 1000 ml of water)-acetonitrile (88 : 12) as the mobile phase. The wavelength of the detector is 254 nm and the retention time for cefazolin is about 7.5 minutes.

Procedure Dissolve a quantity, accurately weighed, in the mobile phase to produce a solution of 0.1 mg per ml, shake thoroughly. Inject 10 μ l in the column and record the chromatogram. Repeat the operation, using cefazolin CRS instead of the substance being examined, calculate the content of $C_{14}H_{14}N_8O_4S_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam Antibiotic, cephalosporin.

Storage Preserve in hermetically sealed containers, stored in a cool, dark and dry place.

Preparation Cefazolin Sodium for Injection

Cefazolin Sodium for Injection

Cefazolin Sodium for Injection is a sterile powder of cefazolin Sodium. It contains not less than 86.0% of cefazolin ($C_{14}H_{14}N_8O_4S_3$), calculated on the anhydrous basis. Each container contains not less than 95.0% and not more than 105.0% of the labelled amount of cefazolin ($C_{14}H_{14}N_8O_4S_3$), calculated with reference to the average weight of contents.

Description A white or almost white powder or crystalline powder; odourless.

Identification Complies with the tests for Identification described under Cefazolin Sodium.

Clarity and colour of solution To each of 5 containers add water to produce a solution of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₅ or YG₅ (Appendix IX A, method 1).

Related substances Carry out the method as described under Cefazolin Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents. Comply with the requirements.

Cefazolin polymer Carry out the method as described under

Cefazolin Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents. Calculate the content of cefazolin polymer with reference to cefazolin; not more than 0.04%.

Water Not more than 3.0% (Appendix VIII M, method 1 A).

Acidity, Bacteria endotoxin and Sterility Complies with the requirement described under Cefazolin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cefazolin Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Cefazolin Sodium.

Strength Calculated as $C_{14}H_{14}N_8O_4S_3$
(1) 0.5 g (2) 1.0 g

Storage Preserve in well closed containers, stored in a cool, dark and dry place.

Cefdinir

$C_{14}H_{13}N_5O_5S_2$ 395.42

Cefdinir is (6R, 7R)-7-[(Z)-2-(2-Aminothiazol-4-yl)-2-hydroxyiminoacetyl-amino]-8-oxo-3-vinyl-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. It contains not less than 94.0% of $C_{14}H_{13}N_5O_5S_2$, calculated on the anhydrous basis.

Description A slightly yellow to yellow crystalline powder; odour, slight. Slightly soluble in phosphate BS (pH 7.0); insoluble in water, ethanol, ether.

Specific optical rotation -58° to -66° , in a solution of 10 mg per ml in phosphate BS (pH 7.0) (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in phosphate BS (pH 7.0) at 287 nm (Appendix VI A), the value of A (1%, 1 cm) is 570-610.

Identification (1) The retention time of the principal peak of the substance being examined is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of cefdinir CRS.

Crystallinity Complies with the test for crystallinity (Appendix VI D).

Acidity A suspension of 10 mg per ml in water, pH 2.5-4.5 (Appendix VI H).

Related substances Dissolve a quantity in phosphate BS (pH 7.0), and dilute with mobile phase A to produce a solution of 1.5 mg per ml as the test solution. Transfer 1 ml, accurately measured, to a 100 ml volumetric flask, dilute to volume with mobile phase A, mix well, take it as reference solution. Carry out the method for high performance liquid

chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a solution of 0.4 ml of 0.1 mol/L disodium edetate solution in 1000 ml of 0.25% tetramethylammonium hydroxide solution (adjust pH value to 5.5 with phosphoric acid) as mobile phase A, a solution of 0.4 ml of 0.1 mol/L disodium edetate solution in the mixture of 0.25% tetramethylammonium hydroxide solution (adjust pH value to 5.5 with phosphoric acid)-acetonitrile-methanol (500 : 300 : 200) as mobile phase B. Detection wavelength is 254 nm and column temperature is 40°C. Dissolve the cefdinir CRS in phosphate BS (pH 7.0), using the mobile phase A to produce a solution of 1.5 mg per ml, heat it in a water bath for 30 minutes and cool, inject 20 µl into the column, the retention time of the principal peak of cefdinir is about 22 minutes, the retention time of the principal peak of E-isomer is about 33 minutes. The number of the theoretical plate of the column is not less than 7000, calculated with reference to the peak of cefdinir. The resolution factor between peaks of cefdinir and adjacent peak is not less than 1.0. Inject 20 µl of reference solution into the column. Adjust the attenuation so that the principal peak height in chromatogram is 20% of full scale of the chart, inject separately 20 µl of the test solution and reference solution into the column and record the chromatograms of the principal peak. The sum of the area of all impurity peaks in the chromatogram obtained with test solution is not greater than 3 times area of the principal peak in the chromatogram obtained with reference solution respectively (not more than 3.0%). The area of E-isomer peak in the chromatogram obtained with the test solution is not greater than of 0.8 time area of the principal peak in the chromatogram obtained with the reference solution respectively (0.8%). Disregard any peak with an area less than 0.05 times area of the principal peak in the chromatogram obtained with reference solution.

Time (minutes)	mobile phase A (per cent V/V)	mobile phase B (per cent V/V)
0	95	5
2	95	5
22	75	25
32	50	50
37	50	50
38	95	5
48	95	5

Water Not more than 2.0% (Appendix VIII M method 1 A), using a mixture of formamide and methanol (2 : 1) instead of methanol.

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metal Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.001%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a 0.1 mol/L solution of disodium dihydrogen ethylenediamine tetraacetate 0.4 ml in mixture of 0.25% tetramethylammonium hydroxide (adjust pH value to 5.5 with phosphoric acid)-acetonitrile-methanol (900 : 60 : 40) as the mobile phase. detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of cefdinir.

Procedure Dissolve about 20 mg, accurately weighed, in phosphate BS (pH 7.0) in a 100 ml volumetric flask and dilute to volume, mix well. Inject 20 µl of the resulting solution into the column. Repeat the operation, using cefdinir CRS instead of the substance being examined. Calculate the content of $C_{14}H_{13}N_5O_5S_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosporin.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Cefdinir Capsules

Cefdinir capsules

Cefdinir capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefdinir ($C_{14}H_{13}N_5O_5S_2$).

Description A slightly yellow or yellow powder or granules.

Identification (1) The retention time of the principal peak of the substance being examined is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(2) To an accurately weighed quantity equivalent to about 10 mg of cefdinir of the mixed content. The light absorption of a solution of 10 µg per ml in phosphate BS (pH 7.0) exhibits maxima at 287 nm and 224 nm, and a minimum at 248 nm (Appendix IV A).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 3.0% of its weight (Appendix VIII L).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using a solution of hydrochloric acid (dilute hydrochloric acid, 24 → 1000) 900 ml as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw the solution after exactly 30 minutes and filter. Dilute a quantity of the successive filtrate with the above hydrochloric acid solution in amber-coloured volumetric flask to produce a solution of 10 µg per ml. Dissolve a quantity of cefdinir CRS in phosphate BS (pH 7.0) in amber-coloured volumetric flask to produce a solution of 250 µg per ml, filter, dilute the successive filtrate, accurately measured, with the above dissolution medium to produce a solution of 10 µg per ml. Measure the absorbances of the resulting solutions at 280 nm (Appendix IV A). Calculate the dissolution of $C_{14}H_{13}N_5O_5S_2$ from each capsules. Not less than 75% of the labelled amount is dissolved.

Related substances Carry out the method as described under Cefdinir, using an accurately weighed quantity of the mixed contents obtained from the test for weighed variation of contents. Dissolve the Cefdinir in phosphate BS (pH 7.0), with the mobile phase A to produce a solution of 1.5 mg per ml, filter and use the successive filtrate as the test solution. the area of E-isomer peak in the chromatogram obtained with the test solution is not more than 0.8%, and the sum of areas other than cefdinir is not more than 3.5%. Disregard any peak with an area less than 0.05 times area of the principal peak in the chromatogram obtained with reference solution.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the assay described under cefdinir. Dissolve a quantity of the mixed contents in the test for weigh variation

of contents equivalent to about 50 mg of cefdinir, accurately weighed, in 250 ml amber-coloured volumetric flask with phosphate BS (pH 7.0), dilute to volume with the mobile phase, mix well, filter and inject 20 μ l of the successive filtrate into the column.

Category As described under Cefdinir.

Strength 0.1 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Cefoperazone

$C_{25}H_{27}N_9O_8S_2$ 645.68

[62893-19-0]

Cefoperazone is (6*R*, 7*R*)-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-7-[(*R*)-2-(4-ethyl-2,3-dioxo-1-piperazinecarboxamido)-2-*p*-hydroxyphenyl]acetamido]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. It contains not less than 98.0% of $C_{25}H_{27}N_9O_8S_2$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter; hygroscopic. Soluble in acetone or dimethyl sulfoxide; slightly soluble in methanol or ethanol; very slightly soluble in water or ethyl acetate.

Specific optical rotation -30° to -38° , in a solution of 30 mg per ml in a mixture of phosphate buffer solution [adjusted with potassium dihydrogen phosphate solution (1 mol/L) to the pH 6.0 with potassium hydroxide solution (10 mol/L)]-acetonitrile (90 : 10) (Appendix VI E).

Identification (1) Dissolve 10 mg in a mixture of 2 ml of water and 3 ml of hydroxylamine hydrochloride solution [mix well one part of 34.8% hydroxylamine hydrochloride solution, one part of sodium acetate-sodium hydroxide solution (dissolve 10.3 g of sodium acetate and 86.5 g of sodium hydroxide in sufficient water to produce 1000 ml) and 4 parts of ethanol], shake thoroughly. Allow to stand for 5 minutes, add 1 ml of acidic ferric ammonium sulfate TS, mix well; a reddish-brown colour is produced.

(2) The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

Acidity Mix well a quantity with water to produce a suspension of 10 mg per ml, pH 2.0-4.0 (Appendix VI H).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D) using a column packed with octadecylsilane bonded silica gel and a mixture triethylamine acetic acid solution (to 14 ml of triethylamine add 5.7 ml of glacial acetic acid in a 100 ml volumetric flask, dilute with water to volume)-acetonitrile-water (1.2 : 180 :

820) adjusted pH value to 3.0 ± 0.2 with glacial acetic acid as the mobile phase. Wavelength of the detector is 254 nm. Dissolve a quantity of cefoperazone CRS, cefoperazone impurity A CRS previously dissolved in acetonitrile and cefoperazone S-isomer in a small amount of phosphate buffer solution (mix 39.0 ml of 0.2 mol/L sodium dihydrogen phosphate solution with 61.0 ml of 0.2 mol/L disodium hydrogen phosphate solution, pH 7.0), and dilute with mobile phase to produce a mixed solution containing 0.2 mg each of the four substances per ml, inject 20 μ l of the mixed solution into the column. The elute order is cefoperazone impurity A, cefoperazone and cefoperazone S-isomer, the resolution factors between two adjacent peaks complies with the related requirements.

Procedure Dissolve about 50 mg, accurately weighed, in mobile phase and dilute with the mobile phase to 100 ml in a 100 ml volume flask and mix well. Inject 20 μ l of the resulting solution into the column and record the chromatogram. Dissolve a quantity of cefoperazone CRS in phosphate buffer described above, dilute with mobile phase to produce to a solution of 0.5 mg per ml and repeat the operation. Calculate the content of $C_{25}H_{27}N_9O_8S_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosporin.

Storage Preserve in tightly closed containers, stored in a cool place.

Cefoperazone Sodium

$C_{25}H_{26}N_9NaO_8S_2$ 667.66

[62893-20-3]

Cefoperazone Sodium is the sodium salt of (6*R*, 7*R*)-3-[[[(1-methyl-1*H*-tetrazol-5-yl)thio]methyl]-7-[(*R*)-2-(4-ethyl-2,3-dioxo-1-piperazine carboxamido)-2-*p*-hydroxyphenyl]acetamido]-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate. It contains not less than 88.0% of $C_{25}H_{27}N_9O_8S_2$, calculated on the anhydrous basis.

Description A white to slightly yellow powder or crystalline powder; odourless; hygroscopic. Soluble in water; slightly soluble in methanol; very slightly soluble in ethanol; insoluble in acetone or ethyl acetate.

Specific optical rotation -15° to -25° in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(2) The infrared absorption spectrum of the substance being examined (Appendix IV C) is concordant with the reference spectrum of cefoperazone sodium (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix

III).

Acidity To a quantity add water to produce a solution of 0.25 g per ml, pH 4.5-6.5 (Appendix VI H).

Clarity and colour of solution Dissolve separately each of the 5 portions with water to produce solutions of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A, method 1).

Cefoperazone polymer Carry out the method for size exclusion chromatography (Appendix V H), using a column 1.3-1.6 cm in internal diameter, 30-40 cm in column length packed with sephadex G-10 (40-120 μ m), 0.01 mol/L phosphate BS (pH 7.0) [a mixed solution of 0.01 mol/L disodium hydrogen phosphate and 0.01 mol/L sodium dihydrogen phosphate (61 : 39)] as the eluent A and water as the eluent B with a flow rate 1 ml per minute. Detection wavelength is 254 nm. Inject 200 μ l of 1 mg/ml blue dextran 2000 solution, using eluent A and eluent B as mobile phase separately, the number of theoretical plates is not less than 700, calculated with reference to blue dextran 2000, and the tailing factor is less than 2.0. The ratio of the retention time of blue dextran 2000 peak in eluent A to eluent B should be between 0.93 and 1.07. The proportions of the retention time of the principle peak of reference solution and the polymer peak of test solution to blue dextran 2000 peak of the related system should be between 0.93 and 1.07. Using eluent B as the mobile phase, inject accurately 200 μ l of reference solution into column. The relative standard deviation (RSD) for replicate injections of reference solution is less than 5.0%.

Reference solution Dissolve about 25 mg of cefoperazone CRS, accurately weighed, in water and dilute to produce a solution of 100 μ g per ml.

Procedure Dissolve about 0.2 g, accurately weighed, in water and dilute to volume in a 10 ml volumetric flask, mix well. Inject 200 μ l of the resulting solution into the column immediately, using eluent A as the mobile phase, and record the chromatogram. Inject 200 μ l of the reference solution, using eluent B as the mobile phase, and record the chromatogram. Calculate the content of cefoperazone polymer with reference to cefoperazone with respect to the peak area obtained in the chromatogram by the external standard method; not more than 0.4%.

Related substances Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the cefoperazone peak height in the chromatogram is about 15% of full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a test solution of 0.5 mg per ml. Transfer 1 ml of test solution, measured accurately, in a 100 ml volumetric flask, dilute with mobile phase to volume and mix well as reference solution. Dissolve a quantity of the cefoperazone impurity A, accurately weighed, in mobile phase to produce a impurity reference solution of 15 μ g per ml. Inject accurately 20 μ l of test solution, impurity reference solution and reference solution respectively into column and record the chromatogram for four times the retention time of the cefoperazone peak. Calculate the content of cefoperazone impurity A with respect to the peak area obtained in the chromatogram by the external standard method; not more than 3.0%. Each peak area other than the principal peak and impurity A is not greater than twice the principal peak in the chromatogram obtained with the reference solution (2%). The sum of the areas of all peaks other than the

principal peak is not greater than five times of area of the principal peak in the chromatogram obtained with the reference solution (5.0%). Disregard any peak with an area less than 0.1 times area of the principal peak in the chromatogram obtained with reference solution.

Acetone Carry out the method for Head-Space gas chromatography (VIII P). Using a capillary column of HP-5 (or equivalent). Column temperature is 80°C. A Flame Ionization Detector (FID) is used. The temperature of detector is 250°C and injection port is 100°C. Head-space injection is used. The equilibrium temperature of head-space vials is 80°C holding 30 minutes. Inject volume is 1.0 ml. Dissolve 100 mg of the substance being examined, accurately weighed in the head-space vials and pipette 3 ml of water accurately in the vials and mix well. Seal the vials as test solution. weigh accurately 33 mg of acetone in 50 ml volumetric flask, add water to volume and mix well. Accurately pipette 3.0 ml in the head-space vials and seal the vials as standard solution. Inject the test solution and standard solution to the column separately and record the chromatogram. Calculate the content with respect to the peak area obtained in the chromatogram by external standard method. The content of acetone is not more than 2.0%.

Water Not more than 5.0% (Appendix III M, method 1A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.05 EU per mg of cefoperazone.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in 500 ml of 0.9% sterile Sodium Chloride Solution.

Assay Carry out the Assay described under Cefoperazone.

Category β -lactam antibiotic, cephalosporin.

Storage Preserve in tightly closed containers, stored in a cold place.

Preparation Cefoperazone Sodium for Injection

Cefoperazone Sodium and Sulbactam Sodium for Injection

Cefoperazone Sodium and Sulbactam Sodium for Injection is a sterile mixture of Cefoperazone Sodium and Sulbactam Sodium (1 : 1). It contains not less than 43.5% of cefoperazone ($C_{25}H_{27}N_9O_8S_2$) and 44.5% of sulbactam ($C_8H_{11}NO_5S$) per mg respectively, calculated on the anhydrous basis. It contains not less than 90.0% and not more than 115.0% of the labelled amount of cefoperazone ($C_{25}H_{27}N_9O_8S_2$) and sulbactam ($C_8H_{11}NO_5S$), calculated with the reference to the average weight of contents.

Description A White or almost white powder.

Identification (1) The retention time of two principal peaks of the substance being examined in the chromatogram obtained in the Assay are identical with that of principal peaks of cefoperazone CRS and sulbactam CRS in the chromatogram of the reference solution correspondingly.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-acetone-acetic acid-water (10 : 5 : 2 : 2) as the mobile phase. Apply separately to the plate

2.5 μ l each of test solution containing 10 mg of the substance being examined per ml, reference solution (1) containing 5 mg of sulbactam CRS per ml in water respectively, and reference solution (2) containing 5 mg of cefoperazone CRS per ml in acetone. After developing and removal of the plate, dry it in air and visualize with iodine vapor. The position of the principal spots in the chromatogram obtained with the test solution correspond to the principal spots obtained with the reference solutions.

(3) Yields the flame reaction of sodium salts (Appendix III).

Test (1) and (2) may be used alternatively.

Acidity Dissolve a quantity in water to produce a solution of 125 mg of cefoperazone per ml, pH 3.5-6.5 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce a solution of 50 mg of cefoperazone per ml, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ (Appendix IX A method 1).

Related substances Carry out the method as described under Assay. Inject 10 μ l of the reference solution into the column. Adjust the attenuation so that the cefoperazone peak height in the chromatogram is about 25% of full scale of the chart. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 4 mg per ml as test solution. Transfer 1 ml of test solution, accurately measured, in a 100 ml volumetric flask, dilute with mobile phase to volume and mix well as reference solution. Inject accurately 10 μ l of test solution and reference solution respectively into the column and record the chromatogram for three times the retention time of the cefoperazone peak. The sum of the areas of all peaks other than the principal peak is not greater than five times of the sum areas of the cefoperazone peak and sulbactam peak in the chromatogram obtained with the reference solution (5.0%). Disregard any peak with an area less than 0.05 times that of the sum area of the cefoperazone peak and sulbactam peak in the chromatogram obtained with reference solution.

Water Not more than 4.0% (Appendix VIII M method 1).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.125 EU per mg.

Sterility Dissolve the content of each container in 500 ml of 0.9% sterile sodium chloride solution. The solution complies with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.005 mol/L tetrabutylammonium hydroxide solution (to 6.6 ml of 40% tetrabutylammonium hydroxide solution add 1800 ml of water, adjust pH value to 4.0 with 1 mol/L phosphoric acid solution, add water to 2000 ml, mix well)-acetonitrile (750 : 250) as the mobile phase. Detection wavelength is 220 nm. Dissolve a quantity of cefoperazone CRS and sulbactam CRS in a small amount of phosphate BS [mix 39.0 ml of 0.2 mol/L disodium hydrogen phosphate solution with 61.0 ml of 0.2 mol/L sodium dihydrogen phosphate solution and adjust pH value to 7.0 with phosphoric acid] and dilute with mobile phase to produce a solution containing 1 mg each of two substances per ml. Heat for 30 minutes at 60°C in a

water bath to produce cefoperazone degradation product peak which the relative retention time is about 0.9. Inject 10 μ l into column and record the chromatogram. The number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of cefoperazone, the resolution factors between the peaks of cefoperazone degradation product and sulbactam, the resolution factors between cefoperazone and adjacent peak comply with the requirement.

Procedure Dissolve a quantity of the mixed contents obtained in the test for weight variation of contents (equivalent to 100 mg cefoperazone), accurately weighed, in mobile phase in a 200 ml volumetric flask, dilute to volume and mix well. Inject 10 μ l into the column and record the chromatogram. Dissolve about 25 mg of cefoperazone CRS and sulbactam CRS in phosphate buffer solution described above in a 50 ml volumetric flask, dilute with mobile phase to volume, and repeat the operation. Calculate the content of C₂₅H₂₇N₉O₈S₂ and C₈H₁₁NO₅S with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -Lactam antibiotic.

Strength (1) 1 g (C₂₅H₂₇N₉O₈S₂ 0.5 g : C₈H₁₁NO₅S 0.5 g)
(2) 2 g (C₂₅H₂₇N₉O₈S₂ 1.0 g : C₈H₁₁NO₅S 1.0 g)
(3) 3 g (C₂₅H₂₇N₉O₈S₂ 1.5 g : C₈H₁₁NO₅S 1.5 g)

Storage Preserve in well closed containers, stored in a cold place.

Cefoperazone Sodium for Injection

Cefoperazone Sodium for Injection is a sterile powder or sterile lyophilized preparation of cefoperazone sodium. It contains not less than 88.0% of cefoperazone (C₂₅H₂₇N₉O₈S₂), calculated on the anhydrous basis. It contains not less than 95.0% and not more than 105.0% of the labelled amount of cefoperazone (C₂₅H₂₇N₉O₈S₂), calculated with reference to the average contents.

Description A white to slightly yellow crystalline powder or lyophilized powder or mass; odourless; hygroscopic. Freely soluble in water; sparingly soluble in methanol; very slightly soluble in ethanol; insoluble in acetone or ethyl acetate.

Specific optical rotation -15° to -25° , in a solution of 10 mg per ml in water (Appendix VI E).

Identification Complies with the tests for Identification described under Cefoperazone Sodium.

Clarity and colour of solution To each of 5 containers add water to produce a solution of 0.1 g per ml, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₆ (Appendix IX A, method 1).

Related substances Carry out the method as described under Cefoperazone Sodium. Calculate the content of cefoperazone impurity A with respect to the peak area obtained in the chromatogram by the external standard method; not more than 3.5%. Each peak area other than the principal peak and impurity A is not greater than 2.5 times of the principal peak in the chromatogram obtained with the reference solution (2.5%). The sum of the areas of all

peaks other than the principal peak is not greater than six times of area of the principal peak in the chromatogram obtained with the reference solution (6.0%). Disregard any peak with an area less than 0.1 times that of the sum area of the principal peak in the chromatogram obtained with reference solution.

Cefoperazone polymer Carry out the method described under Cefoperazone Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents. Calculate the content of cefoperazone polymer with reference to cefoperazone; not more than 0.8%.

Acidity, water, Bacterial endotoxin and Sterility As described under Cefoperazone Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cefoperazone, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Cefoperazone Sodium.

Strength Calculated as $C_{25}H_{27}N_9O_8S_2$
(1) 0.5 g (2) 1.0 g (3) 2.0 g

Storage Preserve in well closed containers, stored in a cool place.

Cefotaxime Sodium

$C_{16}H_{16}N_5NaO_7S_2$ 477.45 [64485-93-4]

Cefotaxime Sodium is sodium (6*R*, 7*R*)-3-[(Acetyloxy) methyl]-7-[(2-amino-4-thiazolyl) (methoxyimino) acetyl amino]-8-oxo-5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylic acid. It has a potency of not less than 86.0% of $C_{16}H_{16}N_5NaO_7S_2$, calculated on the anhydrous basis.

Description A white to pale yellowish-white crystal; odourless or slightly characteristic. Freely soluble in water; slightly soluble in ethanol; insoluble in chloroform.

Specific optical rotation $+56^\circ$ to $+64^\circ$, in a solution of 10 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in hydrochloric acid solution (0.01 mol/L) at 262 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 400-440, calculated on the anhydrous basis.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefotaxime (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of about 0.1 g per ml, pH 4.5-6.5 (Appendix VI H).

Clarity and colour of solution To 5 portions each add water to produce solutions of 0.1 g per ml respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B), any colour produced is not more intense than that of reference solution Y_8 or OY_8 (Appendix IX A).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Cefotaxime polymer Carry out the method for size exclusion chromatography (Appendix V H). Using a column with 1.3-1.6 cm in internal diameter and 30-40 cm in column length, packed with sephadex G-10 (40-120 μ m), a 0.1 mol/L phosphate buffer pH 7.0 [0.1 mol/L disodium hydrogen phosphate solution-0.1 mol/L sodium dihydrogen phosphate (61 : 39)] as eluent A and water as eluent B. The flow rate is 1.5 ml per minute and the detection wavelength is 254 nm. Inject 200 μ l of a solution containing 0.1 mg of blue dextran 2000 per ml into the column separately using eluent A and eluent B as the mobile phase. The number of the theoretical plates of the column is not less than 700, calculated with reference to blue dextran 2000, and the tailing factor is not more than 2.0. The ratio of retention time of blue dextran 2000 peak in eluent A to eluent B is between 0.93-1.07, the ratio of retention time of the polymer peak of the test solution and the principal peak of reference solution to the blue dextran 2000 peak in the corresponding system should be between 0.93-1.07. The relative standard deviation (RSD) of the areas of the principal peak in chromatogram obtained with accurately measured 200 μ l of the reference solution for 5 replicate injections is not more than 5.0%, using eluent B as the mobile phase.

Reference solution Dissolve an accurately weighed quantity of cefotaxime CRS in water to produce a solution of 100 μ g per ml.

Procedure Dissolve about 0.2 g, accurately weighed, with water in a 10 ml volumetric flask, dilute to volume with water, mix well as test solution. Inject immediately 200 μ l into the column and record the chromatogram, using eluent A as the mobile phase. Inject 200 μ l the reference solution into the column and record the chromatogram, using eluent B as the mobile phase. The content of cefotaxime polymer is not more than 0.5%, calculate as cefotaxime with respect to the peak area obtained in the chromatogram by the external standard method.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.05 EU per 1 mg of cefotaxime.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method). Dissolve the test in a suitable solution, and then transfer it into not less than 500 ml of 0.9% sterile sodium carbonate solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsiane bonded silica gel and a mixture of phosphate BS (Dissolve 60 mg of potassium dihydrogen phosphate and 1.2 g of disodium hydrogen phosphate in water and dilute to 1000 ml)-methanol (89 : 11) as the mobile phase. The wavelength of the detector is 254 nm and the number of the theoretical plates of the column is not less than 1200, calculated with reference to the peak of

cefotaxime sodium.

Procedure Dissolve about 40 mg, accurately weighed, in water in a 100 ml volumetric flask and dilute to volume, mix well. Transfer 5 ml of the solution in another 100 ml volume. Inject 2 μ l of the resulting solution into the column and record the chromatogram. Repeat the operation using cefotaxime CRS instead of the substance being examined, calculate the content of $C_{16}H_{16}N_5NaO_7S_2$.

Category β -lactam antibiotic, cephalosporin.

Storage Preserve in hermetically sealed containers, stored in a cool and dry place and protected from light.

Preparation Cefotaxime Sodium for Injection

Cefotaxime Sodium for Injection

Cefotaxime Sodium for Injection is a sterile powder of Cefotaxime Sodium. It contains not less than 86.0% of cefotaxime ($C_{16}H_{17}N_5O_7S_2$), calculated on the anhydrous basis. Each container contains not less than 93.0% and not more than 107.0% of the labelled amount of cefotaxime ($C_{16}H_{17}N_5O_7S_2$), calculated on basis of the average weight of contents.

Description A white to pale yellowish-white crystalline powder.

Identification Complies with the tests (1) and (3) for Identification described under Cefotaxime Sodium.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml by the labelled amount, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B), any colour produced is not more intense than that of reference solution Y_5 or OY_5 (Appendix IX A).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Cefotaxime polymer Carry out the method described under Cefotaxime Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents. Calculate the content of cefotaxime polymer with reference to cefotaxime; not more than 1.0%.

Acidity, Bacterial endotoxin and sterility Complies with the corresponding requirement described under Cefotaxime Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cefotaxime Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Cefotaxime Sodium.

Strength Calculated as $C_{16}H_{17}N_5O_7S_2$
(1) 0.5 g (2) 1.0 g (3) 2.0 g

Storage Preserve in well closed containers, stored in a cool and dry place and protected from light.

Cefradine

$C_{16}H_{19}N_3O_4S$ 349.40

[38821-53-3]

Cefradine is (6*R*, 7*R*)-7-[(*R*)-2-amino-2-(1,4-cyclohexadien-1-yl)-acetamido]-3-methyl-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid. It contains not less than 90.0% of $C_{16}H_{19}N_3O_4S$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odour, characteristic.

Sparingly soluble in water; practically insoluble in ethanol, chloroform or ether.

Specific optical rotation $+80^\circ$ to $+90^\circ$, in a solution of 10 mg per ml in acetate buffer solution (dissolve 1.36 g of sodium acetate in 50 ml of water, adjust to pH 4.6 with glacial acetic acid and add water to produce 100 ml), (Appendix VI E).

Identification (1) Carry out the method of thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mix of 0.1 mol/L citric acid solution-0.2 mol/L disodium hydrogen phosphate solution-acetone (60 : 40 : 1.5) as the mobile phase. Activate the plate at 105°C for 1 hour and elute with a freshly prepared 5% (ml/ml) solution of *n*-tetradecane in *n*-hexane, dry in air. Apply separately to the plate 5 μ l each of the two solutions in water containing ① 6 mg of the substance being examined per ml and ② 6 mg of Cefradine CRS per ml. After developing and removal of the plate, heat it at 105°C for 5 minutes, spray with 0.1% solution of ninhydrin in the mobile phase, and heat at 105°C for 15 minutes. The colour and position of the principal spot in the chromatogram obtained with solution ① correspond to that of the principal spot in the chromatogram obtained with solution ②.

(2) The retention time of principal peaks of the substance being examined in the chromatogram is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(3) Dissolve a quantity in methanol evaporate to dryness at room temperature and prepare spectrum of the residue. The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cefradine (Appendix XVI). (1) or (2) may be used alternatively.

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity To a quantity add water to produce a solution of 10 mg per ml, pH 3.5-6.0 (Appendix VI H).

Clarity and colour of solution To each of five portions (0.55 g of the substance being examined in each portion) add 0.15 g of sodium carbonate and 5 ml of water respectively. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_5 or YG_5 (Appendix IX A, method 1) (for parenteral administration).

Cefalexin Carry out the method described under Assay to produce a test solution. Dissolve about 20 mg of cefalexin

CRS, accurately weighed, in the mobile phase by ultrasonical treatment in a 50 ml volumetric flask, mix well and dilute to volume. Measure accurately 5 ml of the solution to a 50 ml volumetric flask, add mobile phase to volume, mix well, as reference solution. Carry out the method as described under Assay. Inject 10 μ l of the reference solution into the column. Adjust the attention so that the principal peak height in the chromatogram is about 20%-25% of full scale of the chart. Inject separately 10 μ l of the test solution and reference solution into the column and record the chromatogram. The content of cefalexin is not more than 5.0%, calculated on the anhydrous basis.

Cefradine polymer Carry out the method for column chromatography (Appendix V H), using a column with 1.3-1.6 cm in internal diameter and 30-40 cm height packed with sephadex G-10 (40-120 μ m), a 0.2 mol/L phosphate buffer solution (pH 8.0) [0.2 mol/L disodium hydrogen phosphate solution-0.2 mol/L sodium dihydrogen phosphate solution (95 : 5)] as eluent A and water as eluent B. The flow rate is 1.0 ml per minute and the detection wavelength is 254 nm. Inject 200 μ l of the solution of 0.1 mg/ml blue dextran 2000 per ml into the column using eluent A and eluent B separately. The number of the theoretical plates of the column is not less than 700 and the tailing factor is not more than 2.0, calculated with reference to the peak of blue dextran 2000. The ratio of retention time of blue dextran 2000 peak in eluent A to eluent B is 0.93-1.07, the ratio of retention time of the polymer peak of the test solution and the blue dextran 2000 peak in mobile phase A is 0.93-1.07, and the ratio of retention time of the principal peak of the reference solution and the blue dextran 2000 peak in mobile phase B is 0.93-1.07. The relative standard deviation (RSD) of the areas of the principal peak in the chromatogram obtained with 200 μ l of the reference solution for five replicate injections is not more than 5.0%, using eluent B as the mobile phase. (using a 0.2 mol/L sodium hydroxide solution and 0.5 mol/L sodium chloride solution to rinse the gel column, then rinse to neutrality with water if necessary).

Reference preparation Dissolve an accurately weighed quantity of Cefradine CRS in water to produce a solution of 10 μ g per ml.

procedure Dissolve about 0.2 g, accurately weighed, dilute with mobile phase A to 10 ml. Inject immediately 200 μ l into column and record the chromatogram, using eluent A as the mobile phase. Repeat the operation, using the reference solution instead of the solution of substance being examined and eluent B instead of the eluent A. The content of cefradine polymer is not more than 0.05%, calculated as cefradine ($C_{16}H_{19}N_3O_4S$) with respect to the peak area obtained in the chromatogram by the external standard method.

Related substances Carry out the method as described under Assay. Dissolve an accurately weighed quantity of the substance being examined in mobile phase to produce a solution of 1 mg per ml as test solution, dilute an accurately measured quantity with mobile phase to produce a reference solution of 5 μ g per ml. Dissolve an accurately weighed quantity in reference solution to produce an impurity reference solution containing 10 μ g per ml of each of cefalexin CRS, dihydrophenylglycine CRS and 7-aminodesacetoxy-cephalosporanic acid CRS. Inject 20 μ l of the impurity reference solution into the column, using 220 nm as the detected wavelength, the order of elution is 7-aminodesacetoxy-cephalosporanic acid, dihydrophenylglycine, cefalexin and cefradine. The resolution factor between each peak complies with the related requirements. Inject 20 μ l of the

reference solution into the column, using 254 nm as the detected wavelength, adjust the attenuation so that the principal peak height in the chromatogram is about 20%-25% of full scale of the chart. Inject separately 20 μ l of the test solution, the impurity reference solution and the reference solution into the column and record the chromatograms for 2.5 times of the retention time of the principal peak, using separately 220 nm and 254 nm as the detected wavelength. The each content of the dihydrophenylglycine (detected at 220 nm) and 7-aminodesacetoxy-cephalosporanic acid (detected at 254 nm) is not more than 1.0%, calculated with respectively area obtained in the chromatogram with the test solution by the external standard method. The area of each peak of other impurities (detected at 254 nm) is not more than 4 times of the area of principal peak in the chromatogram obtained with the reference solution (2.0%). The sum of the area of all other impurity peaks (detected at 254 nm) is not more than 5 times of the area of principal peak in the chromatogram obtained with the reference solution (2.5%).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2%, using 1.0 g (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.002%.

Bacterial endotoxin Dissolve a quantity in a solution of sodium carbonate (dissolve 2.56 g of sodium carbonate previously heated at 170°C for not less than 4 hours in Water for Injection to produce 100 ml). Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.20 EU per mg of cefradine (for injection).

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in 2.6% of sterile sodium carbonate and dilute with not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with an octadecylsilane bonded silica gel and a mixture of water-methanol-3.86% solution of sodium acetate-4% solution of acetic acid (1564 : 400 : 30 : 6) as the mobile phase, the flow rate is 0.7-0.9 ml per minute and the detection wavelength is 254 nm. The number of theoretical plates of the column is not less than 2500, calculated with reference to the peak of cefradine. Inject 10 μ l of the resulting solution prepared by mixing 10 volumes of cefradine CRS solution and 1 volume of cefalexin CRS stock solution (0.4 mg/ml) into the column, and record the chromatogram. The resolution factor between peaks of cefradine and cefalexin complies with the related requirements.

Procedure Dissolve about 70 mg of the substance being examined, accurately weighed, in mobile phase by ultrasonical treatment and dilute to 100 ml, mix well. Inject 10 μ l into the column and record the chromatogram. Repeat the operation, using cefradine CRS preparation instead of the substance being examined. Calculate the content of cefradine ($C_{16}H_{19}N_3OS$) by the external standard method.

Category β -lactam antibiotic, cephalosprin.

Storage Preserve in tightly closed containers filled with nitrogen, stored in a place below 10°C protected from light.

Preparations (1) Cefradine Capsules
(2) Cefradine for Injection

- (3) Cefradine for Suspension
- (4) Cefradine Granules
- (5) Cefradine Tablets

Cefradine Capsules

Cefradine Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefradine ($C_{16}H_{19}N_3O_4S$).

Description The contents are white to pale yellow powder or granules.

Identification The contents of cefradine capsules comply with the test (1) or test (2) for Identification described under Cefradine.

Cefalexin Carry out the test method described under Cefradine, using an accurately weighed quantity to prepare the test solution as described under Assay, the content of cefalexin is not more than 6.0% of the total amount of cefradine and cefalexin.

Related substances Carry out the test method described under Cefradine, the detection wavelength is 254 nm. Using a mixed contents obtained from the test for weight variation of contents, dissolve an accurately weighed quantity in mobile phase to produce a test solution of 1 mg per ml. The content of the 7-aminodesacetoxy-cephalosporanic acid is not more than 1.0%, calculated with respectively area obtained in the chromatogram with the test solution by the external standard method. The area of each peak of other impurities is not more than 5 times the area of principal peak in the chromatogram obtained with the reference solution (2.5%). The sum of the area of all other impurity peaks is not more than 6 times the area of principal peak in the chromatogram obtained with the reference solution (3.0%).

Water Not more than 7.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C, Method 1), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with 0.1 mol/L hydrochloric acid solution to produce a solution of 25 µg per ml. Dissolve an accurately weighed quantity, equivalent to about the average weight in each capsule, of the mixed contents in the test for weight variation of contents in 0.1 mol/L hydrochloride acid solution to produce a solution of 25 µg per ml according to the labelled amount. Measure the absorbances of resulting solutions at 255 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{19}N_3O_4S$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the Assay described under Cefradine, using the mixed contents obtained from the test for weight variation of contents. To an accurately weighed quantity equivalent to about 70 mg of cefradine in a 100 ml volumetric flask, add 70 ml of the mobile phase, dissolve in an ultrasonic bath for 15 minutes and shake thoroughly for 10 minutes, dilute to volume with mobile phase, mix well and filter with 0.45 µm pore size membrane. Measure accurately 10 µl of the successive filtrate and inject into the column.

Category As described under Cefradine.

Strength Calculated as $C_{16}H_{19}N_3O_4S$
(1) 0.125 g (2) 0.25 g (3) 0.5 g

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Cefradine for Injection

Cefradine for Injection is a sterile mixture of Cefradine and suitable amount of solubilizer. It contains not less than 95.0% and not more than 115.0% of the labelled amount of cefradine ($C_{16}H_{19}N_3O_4S$).

Description A white or almost white powder.

Identification The retention time of the principal peak in the chromatogram obtained with the test solution in the Assay is identical with that of the principal peak in the chromatogram obtained with the reference solution.

Alkalinity Dissolve a quantity in water to produce a solution containing 0.1 g of cefradine per ml, pH 8.0-9.6 (Appendix VI H).

Clarity and colour of solution Add water to each of 5 containers to produce solutions containing 0.1 g of cefradine per ml. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_8 or YG_8 (Appendix IX A, method 1).

Cefalexin Carry out the test method described under Cefradine, the content of cefalexin is not more than 6.0% of the total amount of cefradine and cefalexin.

Related substances Carry out the test method described under Cefradine, the detection wavelength is 254 nm. Using a mixed contents obtained from the test for weight variation of contents, dissolve an accurately weighed quantity in mobile phase to produce a test solution of 1 mg per ml. The content of the 7-aminodesacetoxy-cephalosporanic acid is not more than 1.0%, calculated with respectively area obtained in the chromatogram with the test solution by the external standard method. The area of each peak of other impurities is not more than 5 times of the area of principal peak in the chromatogram obtained with the reference solution (2.5%). The sum of the area of all other impurity peaks is not more than 6 times of the area of principal peak in the chromatogram obtained with the reference solution (3.0%).

Loss on drying When dried in vacuum over phosphorous pentoxide at 60°C for 3 hours, loses not more than 5.0% (Appendix VIII L) (containing of sodium carbonate).

Water Not more than 5.0% (Appendix VIII M, method 1 A) (containing of arginine).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.20 EU per mg of cefradine.

Sterility Complies with test for Sterility (Appendix XI H, membrane filtration method), dissolving each portion in not less than 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method described under Cefradine,

using the mixed contents obtained from the test for weight variation of contents. To an accurately weighed quantity equivalent to about 70 mg of cefradine in a 100 ml volumetric flask, add 70 ml of the mobile phase to dissolve the cefradine, and dilute to volume with the mobile phase, mix well, and filter. Measure accurately 10 μ l of the successive filtrate and inject into the column.

Category As described under Cefradine.

Strength Calculated as $C_{16}H_{19}N_3O_4S$
(1) 0.5 g (2) 1.0 g

Storage Preserve in well closed containers, stored in a dark and cool place.

Cefradine for Suspension

Cefradine for Suspension contains not less than 90.0% and not more than 120.0% of the labelled amount of cefradine ($C_{16}H_{19}N_3O_4S$).

Description powders; with flavors; odour, fragrant; taste, sweet.

Identification Complies with the test (1) or test (2) for Identification described under Cefradine.

Acidity A suspension of 25 mg per ml in water, pH 3.5-6.0 (Appendix VI H).

Ratio of sedimental volume Added water according to the ratio of administration, shake for 1 minute, allow to stand for 45 minutes (Appendix I O), ratio of sedimental volume should be not less than 0.90 (for maltidoses).

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Cefalexin Carry out the test method described under Cefradine, the content of cefalexin is not more than 6.0% of the total amount of cefradine and cefalexin.

Other requirements Complies with the general requirements for oral suspensions (Appendix I O).

Assay Carry out the method described under Cefradine, using the mixed contents obtained from the test for filling or weight variation of contents. Dissolve an accurately weighed quantity equivalent to about 70 mg of cefradine in a 100 ml volumetric flask, with 70 ml of the mobile phase by ultrasonic treatment for 15 minutes, and dilute to volume with the mobile phase, mix well, and filter. Measure accurately 10 μ l of the successive filtrate and inject into the column.

Category As described under Cefradine.

Strength Calculated as $C_{16}H_{19}N_3O_4S$
(1) 0.125 g (2) 0.25 g (3) 1.5 g (4) 3.0 g

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Cefradine Granules

Cefradine Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefradine ($C_{16}H_{19}N_3O_4S$).

Description Suspension granules; odour fragrant; taste, sweet.

Identification Complies with test (1) or test (2) for Identification described under Cefradine.

Acidity A suspension of 25 mg per ml in water, pH 3.5-6.0 (Appendix VI H).

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Cefalexin Carry out the test method described under cefradine, the content of cefalexin is not more than 6.0% of the total amount of cefradine and cefalexin.

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Carry out the method described under Cefradine, using the mixed contents obtained from the test for filling or weight variation of contents. Dissolve an accurately weighed quantity equivalent to about 70 mg of cefradine in a 100 ml volumetric flask, with 70 ml of the mobile phase by ultrasonic treatment for 15 minutes, and shake for 10 minutes, and dilute to volume with the mobile phase, mix well, and filter. Measure accurately 10 μ l of the successive filtrate and inject into the column.

Category As described under Cefradine.

Strength Calculated as $C_{16}H_{19}N_3O_4S$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed container, store in a cool and dark place.

Cefradine Tablets

Cefradine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of cefradine ($C_{16}H_{19}N_3O_4S$).

Description Film coated tablets with almost white or slight yellow cores.

Identification Complies with test (1) or test (2) for Identification described under Cefradine.

Cefalexin Carry out the test method described under Cefradine, the content of cefalexin is not more than 6.0% of the total amount of cefradine and cefalexin.

Related substances Carry out the test method described under Cefradine, the detection wavelength is 254 nm. Powder 10 tablets, accurately weighed, and dissolve an accurately weighed quantity of the powder in mobile phase to produce a test solution of 1 mg per ml. The content of the 7-aminodesacetoxy-cephalosporanic acid is not more than 1.0%, calculated with respectively area obtained in the chromatogram with the test solution by the external standard method. The area of each peak of other impurities is not more than 5 times the area of principal peak in the chromatogram obtained with the reference solution (2.5%). The sum of the area of all other impurity peaks is not more than 6 times the area of principal peak in the chromatogram obtained with the reference solution (3.0%).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Dissolution Carry out dissolution test (Appendix X C, method 2), using 900 ml of 0.12 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw a quantity of the solution after exactly 60 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with 0.12 mol/L hydrochloric acid solution to produce a solution of

25 µg per ml. Powder 10 tablets and weigh accurately a quantity of the powder equivalent to average weight, and dissolve with 0.12 mol/L hydrochloric acid solution to produce a solution of 25 µg of cefradine per ml according to the labelled amount. Measure the absorbance of the resulting solutions at 255 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{19}N_3O_4S$ from each table. Not less than 85% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Powder 10 tablets, accurately weighed, and dissolve a quantity of the powder accurately weighed, equivalent to about 70 mg of cefradine, with 70 ml of the mobile phase by ultrasonic treatment for 15 minutes, and shake for 10 minutes, and dilute to volume with the mobile phase, mix well, and filter. Carry out the Assay described under Cefradine. Injecting 10 µl of the successive filtrate into the column.

Category As described under Cefradine.

Strength Calculated as $C_{16}H_{19}N_3O_4S$
(1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed container, store in a cool and dark place.

Ceftazidime

$C_{22}H_{22}N_6O_7S_2 \cdot 5H_2O$ 636.65

[78439-06-2]

Ceftazidime is 1- { [(6R, 7R)-7-[2-(2-Amino-4-thiazolyl) glyoxylamido]-2-carboxy-8-oxo-5-thia-1-azabicyclo [4.2.0] oct-2-ene-3-yl] methyl } pyridinium hydroxide, inner salt, 7² (Z)-[O-(1-carboxy-1-methylethyl) oxime] pentahydrate. It contains not less than 95.0% of $C_{22}H_{22}N_6O_7S_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless or slightly and characteristic odour. Sparingly soluble in phosphate BS (pH 6.0), slightly soluble in water or methanol, insoluble in acetone or chloroform.

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in phosphate BS (pH 6.0) at 257 nm (Appendix IV A), the value of A (1%, 1 cm) is 400-430.

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ceftazidime CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ceftazidime (Appendix XVI)

Acidity An aqueous solution of 5 mg per ml, pH 3.0-4.0

(Appendix VI H).

Clarity and colour of solution Dissolve 0.6 g each of 5 portions in 5 ml of sodium carbonate solution (1→100), the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₆ (Appendix IX A, method 1).

Pyridine Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-0.25 mol/L solution of ammonium dihydrogen phosphate (dissolve 57.515 g of ammonium dihydrogen phosphate in water and dilute to 2000 ml, mix well)-water (300 : 100 : 600) with a pH value adjusted to 7.0 by ammonia solution as the mobile phase. The flow rate is 1.0 ml/min and detection wavelength is 254 nm. The number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of pyridine. The relative standard deviation (RSD) of the areas of the principal peak in the chromatogram obtained with the reference solution for several replicate injections is not more than 3.0%.

Reference solution Dissolve about 1 g of pyridine CRS, accurately weighed, in water in a 100 ml volumetric flask, dilute with water to volume and mix well. Transfer accurately 10 ml to another 100 ml volumetric flask, dilute with water to volume, mix well, store at a temperature of below 15°C. Transfer accurately 2 ml to a 200 ml volumetric flask before using, dilute with phosphate buffer solution (dissolve 5.68 g of disodium hydrogen phosphate and 3.63 g of potassium dihydrogen phosphate in water and diluted to 1000 ml, mix well.) to volume, mix well.

Procedure Dissolve about 660 mg, accurately weighed, in the above phosphate buffer solution (pH 7.0) in a 100 ml volumetric flask and dilute to volume (store at below 15°C and used in 1 hr). Inject 20 µl into the column. Repeat the operation, using pyridine CRS instead of the substance being examined, the peak area obtained in the chromatogram by the external standard method. Not more than 0.12% of pyridine is found.

Ceftazidime polymer Carry out the method for size exclusion chromatography (Appendix V H). Using a column with 1.3-1.6 cm in internal diameter and 30-40 cm height packed with sephadex G-10 (40-120 µm), a 0.1 mol/L phosphate buffer containing 3.5% ammonia sulfate pH 7.0 [0.1 mol/L disodium hydrogen phosphate solution-0.1 mol/L sodium dihydrogen phosphate (61 : 39)] as eluent A and water as eluent B. The flow rate is 0.8 ml per minute and the detection wavelength is 254 nm. Inject 200 µl of a solution containing 0.1 mg of blue dextran 2000 per ml into the column separately using eluent A and eluent B. The number of the theoretical plates of the column is not less than 600 and the tailing factor is not more than 2.0, calculated with reference to the peak of blue dextran 2000, using eluent A and B as mobile phase. The ratio of retention time of blue dextran 2000 peak in the two mobile phases is between 0.93-1.07, the ratio of retention time of the polymer peak of the test solution and the blue dextran 2000 peak in mobile phase A is between 0.93-1.07, the ratio of retention time of the principal peak of the reference solution and the blue dextran 2000 peak in mobile phase B is between 0.93-1.07. The relative standard deviation (RSD) of the areas of the principal peak in chromatogram obtained with accurately measured 200 µl of the reference solution for 5 replicate injections is not more than 5.0%, using eluent B as the mobile phase.

Reference solution Dissolve about 20 mg of ceftazidime CRS, accurately weighed, in water to produce a solution of 100 µg per ml.

Procedure Dissolve about 0.2 g of the substance being examined, accurately weighed, in a 10 ml volumetric flask, add 20 mg of sodium carbonate, dilute to volume with water, mix well as test solution. Inject immediately 200 µl into the column and record the chromatogram, using eluent A as the mobile phase. Inject 200 µl the reference solution into the column and record the chromatogram, using eluent B as the mobile phase. The content of ceftazidime polymer is not more than 0.3%; calculate as ceftazidime with respect to the peak area obtained in the chromatogram by the external standard method.

Loss on drying When dried in vacuum to constant weight at 60°C, loses not less than 13.0%, and not more than 15.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2) using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.1 EU per mg ceftazidime (Dilute the substance being examined with 1% sodium carbonate solution without pyrogens to produce a solution of 80 mg per ml, then dilute that solution to the needed concentration with water for bacterial endotoxin test).

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method). Dissolve the substance being examined in a quantity of sterile sodium carbonate solution (1→100), and then transfer it into not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-phosphate buffer solution (dissolve 42.59 g of disodium hydrogen phosphate and 27.22 g of potassium dihydrogen phosphate in water and dilute to 1000 ml, mix well, and adjust pH to 7.0.)-water (40 : 200 : 1760) as the mobile phase. The flow rate is 1.5 ml per minute and detection wavelength is 254 nm. The resolution factor between peaks of ceftazidime and the impurities complies with the related requirements.

Procedure Dissolve an accurately weighed quantity equivalent to 250 mg of ceftazidime in water in a 250 ml volumetric flask, dilute to volume and mix well. Measure accurately 15 ml to a 100 ml volumetric flask before using, dilute with water to volume. Inject 20 µl into column and record the chromatogram; Dissolve an accurately weighed quantity in water to produce a solution of 1 mg of ceftazidime per ml as stock solution. Measure accurately 15 ml to a 100 ml volumetric flask before using, dilute with water to volume, mix well, and then repeat the operation. Calculate the content of $C_{22}H_{22}N_6O_7S_2$ with respect to the peak area obtained in the chromatogram by the external standard solution.

Category β-lactam antibiotic, Cephalosporin.

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Preparation Ceftazidime for Injection

Ceftazidime for Injection

Ceftazidime for Injection is a sterile mixture of Ceftazidime and suitable amount of solubilizer of sodium carbonate. Each container contains not less than 90.0% and not more than 110.0% of the labelled amount of ceftazidime ($C_{22}H_{22}N_6O_7S_2$).

Description A white or almost white crystalline powder.

Identification (1) Complies with test (1) for Identification described under Ceftazidime.

(2) To a quantity add dilute acid, effervescence is produced with a gas of carbon dioxide evolving, when which is passed into calcium hydroxide TS, a white precipitate is produced immediately.

(3) Yields the flame reactions of sodium salts (Appendix III).

Acidity or alkalinity An aqueous solution of 0.1 g per ml, pH 5.0-7.5 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml according to the labelled amount respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y_6 (Appendix IX A, method 1).

Pyridine Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents in water to produce a solution of 6 mg of ceftazidime per ml. Carry out the test for Pyridine described under Ceftazidime. Not more than 0.4% of pyridine is found.

Ceftazidime polymer Dissolve an accurately weighed quantity in water to produce a solution of 20 mg of ceftazidime per ml. Carry out the test for ceftazidime polymer described under Ceftazidime. Not more than 1.0% of ceftazidime polymer is found, calculated as ceftazidime ($C_{22}H_{22}N_6O_7S_2$).

Loss on drying When dried in vacuum to constant weight at 60°C, loses not more than 13.5% (Appendix VIII L).

Content uniformity Comply with the requirements for content uniformity (Appendix X E), calculated with reference to the content of each container determined from the Assay.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.1 EU per 1 mg of ceftazidime.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method). Dissolve the substance being examined in a suitable solution, and then transfer it into not less than 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 10 containers separately in water to produce a solution of 1 mg ceftazidime per ml. Measure accurately 15 ml to a 100 ml volumetric flask before using, dilute with water to volume, mix well, and then carry out the Assay described under Ceftazidime, calculated the average content of 10 containers.

Category As described under Ceftazidime.

Strength Calculated as $C_{22}H_{22}N_6O_7S_2$

(1) 0.5 g (2) 1.0 g

Storage Preserve in well closed containers, stored in a cool and dark place.

Ceftezole Sodium

$C_{13}H_{11}N_8O_4NaS_3$ 462.47

Ceftezole Sodium is sodium (6R,7R)-3-[(1,3,4-thiadiazol-2-yl)thiomethyl]-8-oxo-7-[(2(1H)-tetrazol-1-yl)-acetamido]-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate. It contains not less than 90.0% of $C_{13}H_{12}N_8O_4S_3$, calculated on the anhydrous basis.

Description A white to slightly yellow powder or crystalline powder; odourless; hygroscopic. Freely soluble in water; slightly soluble in methanol; insoluble in ethanol or ether.

Specific optical rotation -5° to -9° , in a solution of 100 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of an aqueous solution of 16 μ g per ml at 272 nm (Appendix IV A), the value of A (1%, 1 cm) is 270-300.

Identification (1) The light absorption of an aqueous solution of 16 μ g per ml exhibits a maximum at 272 nm (Appendix IV A).

(2) The retention time of the principal peak of the substance to be examined in the chromatogram is identical with that of the principal peak of the reference solution in the chromatogram obtained in the Assay.

(3) Yields the flame reaction of sodium salts (Appendix III).

Acidity Dissolve a quantity in water to produce a solution of 0.1 g per ml, pH 4.5-6.5 (Appendix VI H).

Clarity and colour of solution Dissolve 0.6 g each of 5 portions in 5 ml of water respectively. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX A); any colour produced is not more intense than that of reference solution Y_6 or YG_6 (Appendix IX A, method 1).

Water Not more than 5.0% (Appendix VIII M, method 1 A).

Related substances Carry out the method as described under Assay. Dissolve a quantity in water to produce solution (1) containing 1 mg per ml and solution (2) containing 10 μ g per ml respectively. Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in chromatogram is about 20%-25% of full scale of the chart. Inject separately 20 μ l of the above two solutions into the column and record the chromatograms for two and a half times retention time of the principal peak. The sum of the area of all impurity peaks in the chromatogram obtained with solution (1) is not greater than twice area of the principal peak in the chromatogram obtained with solution (2) (not more than 2.0%). The area of any impurity peak in the chromatogram obtained with solution (1) is not greater than that of the principal peak in the chromatogram obtained with solution (2) (not more than 1.0%).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 60 mg per ml in sterile Water for Injection per kg of rabbit's weight.

Sterility Comply with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in sterile water and dilute with not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of citric acid solution (Dissolve 3 g of citric acid in 900 ml of water)-acetonitrile (90 : 10) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of ceftezole.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 0.2 mg per ml and shake thoroughly. Inject 20 μ l into the column and record the chromatogram. Repeat the operation, using ceftezole CRS instead of the substance being examined. Calculate the content of $C_{13}H_{12}N_8O_4S_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosprin.

Storage Preserve in hermetically sealed containers, stored in a cool and dry place and protected from light.

Preparation Ceftezole Sodium for Injection.

Ceftezole Sodium for Injection

Ceftezole Sodium for Injection is a sterile powder of Ceftezole Sodium. It contains not less than 90.0% of ceftezole ($C_{13}H_{12}N_8O_4S_3$), calculated on the anhydrous basis. Each container contains not less than 90.0% and not more than 110.0% of the labelled amount of ceftezole ($C_{13}H_{12}N_8O_4S_3$).

Description A white to slightly yellow powder or crystalline powder; odourless; hygroscopic.

Identification Complies with the tests for Identification described under Ceftezole Sodium.

Clarity and colour of solution To each of 5 containers, add water to produce a solution of 0.1 g per ml. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX A); any colour produced is not more intense than that of reference solution Y_7 or YG_7 (Appendix IX A, method 1).

Water Not more than 5.5% (Appendix VIII M, method 1 A).

Acidity, Related substances, Pyrogens and sterility Complies with the requirement described under Ceftezole Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B)

Assay Carry out the Assay described under Ceftezole Sodium, using an accurately weighed quantity of the mixed contents obtained from the test for weight variation of contents.

Category As described under Ceftezole Sodium.

Strength Calculated as $C_{13}H_{12}N_8O_4S_3$

(1) 0.25 g (2) 0.5 g (3) 0.75 g (4) 1.0 g

(5) 1.5 g (6) 2.0 g (7) 4.0 g

Storage Preserve in well closed containers, stored in a cool and dry place and protected from light.

Ceftriaxone sodium

$C_{18}H_{16}N_8Na_2O_7S_3 \cdot 3\frac{1}{2}H_2O$ 661.59 [104376-79-6]

Ceftriaxone Sodium is (6*R*, 7*R*) -7- [2- (2-amino-4-thiazolyl) glyoxylamido] -8-oxo-3-[(1, 2,5,6-tetrahydro-2-methyl-5,6-dioxo-as-triazin-3-yl) -thio] methyl} -5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylic acid, 7²- (Z) - (O-methyloxime) disodium salt sesquaterhydrate. It contains not less than 84.0% of ceftriaxone ($C_{18}H_{16}N_8O_7S_3$), calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless.

Freely soluble in water; slightly soluble in methanol; practically insoluble in ether or chloroform.

Specific optical rotation -153° to -170° , in a solution of 10 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml in water at 241 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 495-545.

Identification (1) The retention time of principal peak of the ceftriaxone in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of ceftriaxone CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of ceftriaxone (Appendix XVI).

(3) Yields the flame reaction of sodium salts (Appendix III).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity or alkalinity An aqueous solution of 0.1 g per ml, pH 6.0-8.0 (Appendix VI H).

Clarity and colour of solution Dissolve 0.6 g each of 5 portions in 5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₇ or YG₇ (Appendix IX A, method 1).

Water 8.0%-11.0% (Appendix VIII M, method 1 A).

Related substances Carry out the method as described under Assay. Dissolve an accurately weighed quantity of ceftriaxone CRS in water to produce a reference solution of 2.2 μ g per ml. Inject 20 μ l into the column. Adjust the attenuation so that the principal peak height in the

chromatogram is about 20%-25% of full scale of the chart. The relative standard deviation (RSD) of the areas of the principal peak in the chromatogram obtained with the reference solution for several replicate injections is not more than 3.0%. Dissolve about 22 mg of the substance being examined, accurately weighed, in water in a 100 ml volumetric flask, and dilute to volume as a test solution. Inject 20 μ l of the test solution and the reference solution respectively into the column and record the chromatograms for 3 times the retention time of the principal peak. The sum of the area of all impurity peaks in the chromatogram obtained with the test solution is not greater than 2 times of the area of the principal peak in the chromatogram obtained with the reference solution (not more than 2.0%). The area of any impurity peak in the chromatogram obtained with the test solution is not greater than 0.5 times that of the principal peak in the chromatogram obtained with the reference solution (not more than 0.5%).

Ceftriaxone Polymer Carry out the method for size exclusion chromatography (Appendix V H), using a column 1.3-1.6 cm in internal diameter, 30-40 cm in column length, packed with sephadex G-10 (40-120 μ m), 0.1 mol/L phosphate buffer pH 7.0 [0.1 mol/L disodium hydrogen phosphate solution-0.1 mol/L sodium dihydrogen phosphate (61 : 39)] as the eluent A and water as the eluent B with a flow rate of 1 ml per minute. Detection wavelength is 254 nm. Inject 200 μ l of 1 mg/ml blue dextran 2000 solution, using eluent A and eluent B as mobile phase separately, the number of theoretical plates is not less than 700, the ratio of the retention time of blue dextran 2000 peak in eluent A to eluent B should be between 0.93-1.07. The ratio of the retention time of the principle peak of reference solution and the polymer peak of test solution to blue dextran 2000 peak of the corresponding system should be between 0.93-1.07. Using eluent B, inject accurately 200 μ l of reference solution into column. The relative standard deviation (RSD) for replicate injections of reference solution is less than 5.0%.

Reference solution Dissolve about 25 mg of ceftriaxone CRS, accurately weighed, in water and dilute with the same solvent to produce a solution of 100 μ g per ml.

Procedure Dissolve about 0.2 g, accurately weighed, in water and dilute to volume in a 10 ml volumetric flask, mix well. Inject 200 μ l of the resulting solution into the column immediately, using eluent A as the mobile phase, and record the chromatogram. Inject 200 μ l of the reference solution, using eluent B as the mobile phase and record the chromatogram. Calculate the content of ceftriaxone polymer with reference to ceftriaxone with respect to the peak area obtained in the chromatogram by the external standard method; not more than 0.5%.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1 g; not more than 0.002%.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 0.20 EU per mg.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolve the substance being examined in a suitable solution, and then transfer it into not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of a 0.02 mol/L solution of *n*-octylamine-acetonitrile (73 : 27), adjust pH to 6.5 with phosphate as the mobile phase. The detection wavelength is 254 nm. Dissolve a quantity of the

substance being examined irradiated by UV light for 24 hours to produce a solution of 0.22 mg per ml, inject 20 μ l into the column and record the chromatogram. The resolution factor between peaks of ceftriaxone and ceftriaxone E-isomer is not less than 6.0.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 0.22 mg per ml. Inject 20 μ l into the column and record the chromatogram. Repeat the operation, using ceftriaxone CRS instead of the substance being examined, calculate the content of $C_{18}H_{18}N_8O_7S_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosprin.

Storage Preserve in hermetically sealed containers, stored in a cool and dry place and protected from light.

Preparation Ceftriaxone Sodium for Injection

Ceftriaxone Sodium for Injection

Ceftriaxone Sodium for Injection is a sterile powder of Ceftriaxone Sodium. It contains not less than 84.0% of ceftriaxone ($C_{18}H_{18}N_8O_7S_3$), calculated on the anhydrous basis. Each container contains not less than 90.0% and not more than 110.0% of the labelled amount of ceftriaxone ($C_{18}H_{18}N_8O_7S_3$), calculated with reference to the average weight of contents.

Description A white or almost white crystalline powder; odourless.

Identification Complies with tests (1) and (3) for Identification described under Ceftriaxone Sodium.

Clarity and colour of solution To each of 5 containers add water to produce solutions of 0.1 g per ml according to the labelled amount respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₉ or OY₉ (Appendix IX A, method 1).

Related substances Carry out the test for Related substance described under Ceftriaxone Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. The area of any impurity peak obtained with the test solution is not greater than that of the principal peak obtained with the reference solution (1.0%) and the sum of area of all impurity peaks is not greater than 4 times the area of principal peak obtained with the reference solution (4.0%).

Ceftriaxone polymer Carry out the test for Ceftriaxone polymer described under Ceftriaxone Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. The ceftriaxone polymer is not more than 0.8%, calculated as ceftriaxone.

Acidity or alkalinity, Water, Bacterial endotoxin and Sterility Complies with the corresponding requirements described under Ceftriaxone Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Ceftriaxone Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Ceftriaxone Sodium.

Strength Calculated as $C_{18}H_{18}N_8O_7S_3$

(1) 0.25 g (2) 0.5 g (3) 1.0 g (4) 2.0 g

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Cefuroxime Axetil

$C_{20}H_{22}N_4O_{10}S$ 510.48

[64544-07-6]

Cefuroxime axetil is a mixture of (RS)-1-Hydroxyethyl (6R, 7R) -7- [2 (2-furyl) glyoxylamido] -3- (hydroxymethyl) -8-oxo-5-thia-1-azabicyclo [4.2.0] oct-2-ene-2-carboxylate, 7²-(Z) - (O-methyloxime), 1-acetate 3-carbamate. It contains not less than 75.0% of cefuroxime ($C_{16}H_{16}N_4O_8S$), calculated on the anhydrous basis.

Description A white or almost white powder; almost odourless; taste, bitter.

Freely soluble in acetone; soluble in chloroform; sparingly soluble in methanol or ethanol; slightly soluble in ether; insoluble in water.

Specific absorbance Measure the absorbance of a solution of 15 μ g per ml in methanol at 276 nm (Appendix IV A), the value of A (1%, 1 cm) is 390-420.

Identification (1) The retention times of the principal peaks of the diastereoisomers of cefuroxime axetil in the substance being examined in the chromatogram obtained in the Assay are identical with those of the principal peaks of diastereoisomers of cefuroxime axetil CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the spectrum of cefuroxime axetil CRS (Appendix XVI).

Crystallinity No birefringence or extinction positions is produced (Appendix IX D).

Diastereoisomer Carry out the method and use the solution as described under Assay. The ratio of diastereoisomer A of cefuroxime axetil to the sum of the diastereoisomers A and B of cefuroxime axetil is between 0.48-0.55, calculated with reference to the peak area obtained in the chromatogram.

Related substances Dissolve an accurately weighed quantity in mobile phase to produce a test solution of about 0.25 mg per ml, transfer 1 ml to a 100 ml volumetric flask and dilute with mobile phase to volume to produce a reference solution. Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that any of the principal peaks' height in the chromatogram is about 20% of full scale of the chart. Inject separately 20 μ l of the test solution and the reference solution into the column immediately and record the chromatograms for 3.5 times the retention time of the

principal peak of diastereoisomer A. The sum of the area of the two E isomer in the chromatogram obtained with the test solution is not greater than the sum of the area of the two principal peaks in the chromatogram obtained with the reference solution, the area of the peak of Δ^3 isomer is not more than 1.5 times, the area of each peak of other impurities is not more than 0.5 times, the sum of the area of all impurity peaks is not more than 3 times. Disregard any peak with the area less than 0.05 times of the sum of the area of the two principal peaks in the chromatogram obtained with the reference solution.

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-0.2 mol/L ammonium dihydrogen phosphate solution (38 : 62) as the mobile phase. The detection wavelength is 278 nm. Dissolve an accurately weighed quantity of cefuroxime axetil CRS in mobile phase to produce a test solution of 0.2 mg per ml (sonicate when necessary), heat the solution in a water bath at 60°C at least for 1 hr to obtain some Δ^3 isomer of cefuroxime axetil. Expose a quantity of cefuroxime axetil to ultraviolet radiation for 24 hrs, and add the mobile phase to produce a solution of E isomer containing 0.2 mg per ml. Inject 20 μ l of the above two solutions into the column and record the chromatogram. The relative retention time of isomer A, B, Δ^3 and E is 1.0, 0.9, 1.2, 1.7 and 2.1 respectively. The resolution factors between peaks of diastereoisomer A and B, diastereoisomer A and Δ^3 comply with the requirements.

Procedure Weigh accurately a quantity equivalent to about 25 mg of cefuroxime to a 100 ml volumetric flask, add the mobile phase, shake to dissolve, dilute to volume and mix well. Inject 20 μ l into the column and record the chromatogram. Repeat the operation, using cefuroxime axetil CRS instead of the substance being examined, calculate the content of $C_{16}H_{16}N_4O_8S$ with respect to the areas of the two principal peaks of cefuroxime axetil obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosprin.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation (1) Cefuroxime Axetil Capsules
(2) Cefuroxime Axetil Tablets

Cefuroxime Axetil Capsules

Cefuroxime Axetil Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cefuroxime ($C_{16}H_{16}N_4O_8S$).

Description Capsules containing white or almost white powder or granules.

Identification The retention times of the two principal peaks in the chromatogram of the test solution obtained in the Assay are identical with those of the principal peaks of the diastereoisomer A and B in the chromatogram of the reference solution correspondingly.

Diastereoisomer Carry out the method and use the solution as described under Assay. The ratio of diastereoisomer A of cefuroxime axetil to the sum of the diastereoisomers A and B of cefuroxime axetil is between 0.48-0.55, calculated with reference to the peak area obtained in the chromatogram.

Related substances Carry out the method as described under Cefuroxime Axetil, using the test solution as described under Assay. Transfer 1 ml to 100 ml volumetric flask and dilute with the mobile phase to volume as the reference solution. The sum of the area of the two isomer in the chromatogram obtained with the test solution is not greater than 1.5 times the sum of the area of the two principal peaks in the chromatogram obtained with the reference solution (1.5%), the area of the peak of Δ^3 isomer is not more than 2 times (2.0%), the area of each peak of other impurities is not more than 1 times (1.0%), the sum of the area of all impurity peaks is not more than 4.5 times (4.5%). Disregard any peak with the area less than 0.05 times of the sum of the area of the two principal peaks in the chromatogram obtained with the reference solution.

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C method 2), using 900 ml of 0.07 mol/L of hydrochloride solution as the dissolution medium, adjust the rotational speed of the paddle to 55 rpm. Withdraw 5 ml of the solution after exactly 15 minutes and 45 minutes, filter and supply 5 ml of the dissolution medium accordingly in the vessel immediately. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a test solution of about 15 μ g per ml. Dissolve an accurately weighed quantity of the mixed contents in the test for weight variation of contents in water to produce a reference solution of about 15 μ g per ml of cefuroxime axetil ($C_{20}H_{22}N_4O_{10}S$) according to the labelled amount. Measure the absorbance of the resulting solutions at 278 nm (Appendix IV A). Calculate the dissolution of $C_{20}H_{22}N_4O_{10}S$ from each capsules. Not less than 60% in 15 minutes and not less than 75% in 45 minutes of the labelled amount are dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed and finely powdered contents in the test for weight variation of contents equivalent to about 125 mg of cefuroxime in 125 ml of methanol in a 100 ml volumetric flask, shake intensively, dilute with the mobile phase to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with mobile phase to volume. Inject 20 μ l into the column immediately, carry out the method for the Assay described under Cefuroxime Axetil.

Category As described under Cefuroxime Axetil.

Strength Calculated as $C_{16}H_{16}N_4O_8S$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Cefuroxime Axetil Tablets

Cefuroxime Axetil Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of cefuroxime ($C_{16}H_{16}N_4O_8S$).

Description Film coated tablets with almost white core.

Identification The retention times of the two principal peaks in the chromatogram obtained with the test solution in the Assay are identical with those of the principal peaks of the diastereomer A and B in the reference solution correspondingly.

Diastereoisomer Carry out the method and use the solution as described under Assay. The ratio of diastereoisomer A of cefuroxime axetil to the sum of the diastereoisomers A and B of cefuroxime axetil is between 0.48-0.55, calculated with reference to the peak area obtained in the chromatogram.

Related substances Carry out the method as described under Cefuroxime Axetil, using the test solution as described under Assay. Transfer 1 ml to 100 ml volumetric flask and dilute with the mobile phase to volume as the reference solution. The sum of the area of the two isomer in the chromatogram obtained with the test solution is not greater than 1.5 times of the sum of the area of the two principal peaks in the chromatogram obtained with the reference solution (1.5%), the area of the peak of Δ^3 isomer is not more than 2 times (2.0%), the area of each peak of other impurities is not more than 1 times (1.0%), the sum of the area of all impurity peaks is not more than 4.5 times (4.5%). Disregard any peak with the area less than 0.05 times of the sum of the area of the two principal peaks in the chromatogram obtained with the reference solution.

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C method 2), using 900 ml of 0.07 mol/L of hydrochloride solution as the dissolution medium, adjust the rotational speed of the paddle to 55 rpm. Withdraw 5 ml of the solution after exactly 15 minutes and 45 minutes, filter and supply 5 ml of the dissolution medium accordingly in the vessel immediately. Dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a test solution of about 15 μ g per ml. Powder finely 10 tablets, dissolve an accurately weighed quantity of the powdered tablets in the hydrochloric acid solution to produce a reference solution of about 15 μ g per ml of cefuroxime axetil ($C_{20}H_{22}N_4O_{10}S$) according to the labelled amount. Measure the absorbance of the resulting solutions at 278 nm (Appendix IV A). Calculate the dissolution of $C_{20}H_{22}N_4O_{10}S$ from each tablet. Not less than 60% in 15 minutes and not less than 75% in 45 minutes of the labelled amount are dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Dissolve an accurately weighed quantity of powdered tablets equivalent to about 125 mg of cefuroxime in 25 ml of methanol by shaking intensively. Dilute with the mobile phase to 100 ml, mix well and filter. Transfer 5 ml of the successive filtrate to a 25 ml volumetric flask and dilute with the mobile phase to volume. Inject 20 μ l into column immediately. Carry out the method for the Assay described under Cefuroxime Axetil.

Category As described under Cefuroxime Axetil.

Strength Calculated as $C_{16}H_{15}N_4O_8S$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Cefuroxime Sodium

$C_{16}H_{15}N_4NaO_8S$ 446.37

[56238-63-2]

Cefuroxime Sodium is sodium (6R, 7R)-7-[2-(2-furyl) glyoxylamido]-3-(hydroxymethyl)-8-oxo-5-thia-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylate. It contains not less than 86.0% of cefuroxime ($C_{16}H_{15}N_4O_8S$), calculated on the anhydrous basis.

Description A white to slightly yellow powder or crystalline powder; odourless; taste, bitter; hygroscopic. Freely soluble in water; sparingly soluble in methanol; insoluble in ethanol and chloroform.

Specific optical rotation $+55^\circ$ to $+65^\circ$, in a solution of 10 mg per ml in water (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 mg per ml in water at 274 nm (Appendix IV A), the value of A (1%, 1 cm) is 390-425.

Identification (1) The retention time of principal peak of cefuroxime in the substance being examined in the chromatogram obtained in the Assay are identical with that of the principal peak of cefuroxime CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of cefuroxime (Appendix XVI).

(3) Yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity An aqueous solution of 0.1 g per ml, pH 6.0-8.5 (Appendix VI H).

Clarity of solution To 5 portions each of 0.6 g, add 5 ml of water respectively, the solutions are clear; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Colour of solution To 5 portions each of 0.6 g, add 5 ml of 0.05 mol/L disodium edetate solution respectively, the solutions are colourless; any colour produced is not more intense than that of reference solution Y_6 or YG_6 (Appendix IX A, method 1).

Related substances Dissolve a quantity in water to produce solution (1) containing 0.5 mg per ml and solution (2) containing 5 μ g per ml respectively. Carry out the method as described under Assay. Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject immediately 20 μ l the two solutions respectively into the column and record the chromatograms for four times the retention time of the principal peak. The area of each impurity peaks in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2); the sum of the area of all impurity peaks in the chromatogram obtained with solution (1) is not greater than 3 times area of the principal peak in the chromatogram obtained with solution

(2) respectively, disregard any peak with an area less than 0.05 times of area of the principal peak in the chromatogram obtained with solution (2).

Cefuroxime polymer Carry out the method for size exclusion chromatography (Appendix V H). Using a column with 1.3-1.6 cm in internal diameter and 30-40 cm height packed with sephadex G-10 (40-120 μm), a 0.025 mol/L phosphate buffer pH 7.0 [0.025 mol/L disodium hydrogen phosphate solution-0.025 mol/L sodium dihydrogen phosphate (61 : 39)] as eluent A and water as eluent B. The flow rate is 1.5 ml per minute and the detection wavelength is 254 nm. Inject 200 μl of a solution containing 0.1 mg of blue dextran 2000 per ml into the column separately using eluent A and eluent B. The number of the theoretical plates of the column is not less than 700 and the tailing factor is not more than 2.0, calculated with reference to the peak of blue dextran 2000, using eluent A and B as mobile phase. The ratio of retention time of blue dextran 2000 peak in the two mobile phases is between 0.93-1.07, the ratio of retention time of the polymer peak of the test solution and the blue dextran 2000 peak in mobile phase A is between 0.93-1.07, the ratio of retention time of the principal peak of the reference solution and the blue dextran 2000 peak in mobile phase B is between 0.93-1.07. The relative standard deviation (RSD) of the areas of the principal peak in chromatogram obtained with accurately measured 200 μl of the reference solution for 5 replicate injections is not more than 5.0%, using eluent B as the mobile phase.

Reference solution Dissolve an accurately weighed quantity of cefuroxime CRS in water to produce a solution of 40 μg per ml.

Procedure Dissolve about 0.2 g of the substance being examined accurately weighed, in a 10 ml volumetric flask, dilute to volume with water, mix well as test solution. Inject immediately 200 μl into the column and record the chromatogram, using eluent A as the mobile phase. Inject 200 μl the reference solution into the column and record the chromatogram, using eluent B as the mobile phase. The content of cefuroxime polymer is not more than 0.2%, calculate as cefuroxime with respect to the peak area obtained in the chromatogram by the external standard method.

Water Not more than 3.5% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): less than 0.10 EU per mg of cefuroxime.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method). Dissolve the substance being examined in a suitable solution, and then transfer it into not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a phosphate buffer pH 3.4 (dilute 50 ml of 0.1 mol/L sodium acetate solution with 0.1 mol/L acetic acid solution to 1000 ml, and mix well) (1 : 10) as the mobile phase. The detection wavelength is 254 nm. Dissolve a quantity of cefuroxime CRS in water to produce a solution of 100 μg per ml, heat in a water bath at 60°C for 10 min to produce some descarbamoylcefuroxime. Inject 20 μl into the column and record the chromatogram. The resolution factor between peaks of cefuroxime and descarbamoylcefuroxime is not less than 2.0.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 0.5 mg per ml. Inject 20 μl into the

column. Repeat the operation, using cefuroxime CRS instead of the substance being examined, calculate the content of $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic, cephalosprin.

Storage Preserve in tightly closed containers, stored in a cold place and protected from light.

Preparation Cefuroxime Sodium for Injection

Cefuroxime Sodium for Injection

Cefuroxime Sodium for Injection is a sterile powder of cefuroxime Sodium. It contains not less than 86.0% of cefuroxime ($\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$), calculated on the anhydrous basis. Each container contains not less than 90.0% and not more than 110.0% of the labelled amount of cefuroxime ($\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$), calculated with reference to the average weight of contents.

Description An white to slightly yellow powder or crystalline powder.

Identification Complies with test (1) and (3) for Identification described under Cefuroxime Sodium.

Acidity or alkalinity A solution of about a 0.1 g per ml in water, pH 6.0-8.5 (Appendix VI H).

Clarity of solution To each of 5 containers add water to produce solutions of 0.1 g per ml according to the labelled amount respectively, the solutions are clear; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B).

Colour of solution To each of 5 containers add 0.05 mol/L disodium edetate solution to produce solutions of 0.1 g per ml according to the labelled amount respectively, the solutions are colourless; any colour produced is not more intense than that of reference solution Y_8 or YG_8 (Appendix IX A, method 1).

Cefuroxime polymer Weigh accurately a quantity of the substance being examined, carry out the test for cefuroxime polymer described under Cefuroxime. Not more than 0.3% of cefuroxime polymer is found, calculated as cefuroxime.

Related substance, Water, Bacterial endotoxin and Sterility Complies with the corresponding requirement described under Cefuroxime Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cefuroxime Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation.

Category As described under Cefuroxime Sodium.

Strength Calculated as $\text{C}_{16}\text{H}_{16}\text{N}_4\text{O}_8\text{S}$

(1) 0.25 g (2) 0.5 g (3) 0.75 g (4) 1.0 g
(5) 1.25 g (6) 1.5 g (7) 1.75 g (8) 2.0 g
(9) 2.25 g (10) 2.5 g

Storage Preserve in well closed containers, stored in a cold place and protected from light.

Chloral Hydrate

$C_2H_3Cl_3O_2$ 165.40

Chloral Hydrate is 2,2,2-trichloro-1,1-ethanedi-ol. It contains not less than 99.0% of $C_2H_3Cl_3O_2$.

Description White or colourless transparent crystals; odour, pungent; taste, slightly bitter; volatilized slowly in air.

Very soluble in water; freely soluble in ethanol, chloroform or ether.

Identification Dissolve 0.2 g in 2 ml of water, add 2 ml of sodium hydroxide TS, a cloudy solution is produced, when heated, becomes two clear layers and gives off the odour of chloroform.

Acidity Dissolve 1.0 g in 10 ml of water, pH 4.0-6.0 (Appendix VI H).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.50 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.01%).

Chloral alcoholate Dissolve 1.0 g in 4 ml of water, add 2 ml of sodium hydroxide TS, mix well and filter. To the filtrate add iodine TS dropwise until a deep brown colour is obtained; No yellow crystalline precipitate is formed within 1 hour.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 4 g, accurately weighed, in 10 ml of water, add accurately 30 ml of sodium hydroxide (1 mol/L) VS, mix well. Allow to stand for 2 minutes, add a few drops of phenolphthalein IS, titrate with sulfuric acid (0.5 mol/L) VS until the red colour disappears. Add 6 drops of potassium chromate IS, titrate with silver nitrate (0.1 mol/L) VS. Calculate the volume of sodium hydroxide (1 mol/L) VS used in the reaction by deducting both the volume of sulfuric acid (0.5 mol/L) VS used in the first titration and 2/15 of the volume of silver nitrate (0.1 mol/L) VS used in the second titration from the volume of sodium hydroxide (1 mol/L) VS added. Each ml of sodium hydroxide (1 mol/L) VS is equivalent to 165.4 mg of $C_2H_3Cl_3O_2$.

Category Hypnotic and anticonvulsant.

Storage Preserve in tightly closed containers.

Chlorambucil

$C_{14}H_{19}Cl_2NO_2$ 304.22

[305-03-3]

Chlorambucil is 4- [bis (2-chloroethyl) amino]

benzenebutyric acid. It contains not less than 98.0% of $C_{14}H_{19}Cl_2NO_2$.

Description An almost white crystalline powder; odour, slight; darkens gradually on exposure to light. Very soluble in acetone; freely soluble in ethanol or chloroform; insoluble in water.

Melting range 64-68°C (Appendix VI C).

Identification (1) The light absorption of a 15 μ g per ml solution in dehydrated ethanol exhibits maxima at 257 nm and 302 nm; minima at 225 nm and 280 nm (Appendix IV A). (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chlorambucil (Appendix XVI).

(3) Dissolve 10 mg in 5 ml of acetone, add 5 ml of water, shake well, heat in a water bath. The solution yields the reactions characteristic of chlorides (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF₂₅₄ as the coating substance and a mixture of toluene-methanol-heptane-butanone (8 : 5 : 4 : 4) as the mobile phase. Apply separately to the plate (dried at room temperature for 24 hours) 10 μ l each of two solutions in acetone containing (1) 20 mg per ml (2) 0.4 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of acetone, add 10 ml of water and 3 drops of phenolphthalein IS. Titrate immediately with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 30.42 mg of $C_{14}H_{19}Cl_2NO_2$.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlorambucil Chart Tablets

Chlorambucil Chart Tablets

Chlorambucil Chart Tablets contain not less than 85.0% and not more than 110.0% of the labelled amount of chlorambucil ($C_{14}H_{19}Cl_2NO_2$).

Description White or almost white chart tablets.

Identification (1) Add 5 ml of acetone to 5 squares of the chart tablets equivalent to about 10 mg of chlorambucil, shake to dissolve chlorambucil and filter. To the filtrate add 5 ml of water and mix well. Add 4 drops of nitric acid solution (1→2) and silver nitrate TS and heat on a water bath, an opalescence is produced.

(2) The light absorption of solution obtained in the Assay exhibits maxima at 257 nm and 320 nm, minima at 225 nm and 280 nm (Appendix IV A).

Content uniformity Comply with the requirements Appendix X E. To 1 square of the chart tablets add accurately 25 ml of a mixture of isopropyl ether-ethanol (1 : 9), shake and allow to stand. Carry out the procedure described under Assay using the supernatant solution, filter if necessary.

Assay Cut 20 squares of the chart tablets into small pieces and transfer to a stoppered conical flask. Add 50 ml of isopropyl ether, previously washed for 4 times with water and accurately measured, shake for 15 minutes, add 5 ml of 10% potassium dihydrogen phosphate solution. Stopper the flask tightly, shake vigorously for 15 minutes. Allow to stand for 5 minutes, measure accurately 5 ml of isopropyl ether solution to a 50 ml volumetric flask, dilute with ethanol to volume. Weigh accurately 40 mg of chlorambucil CRS to a 50 ml volumetric flask, add isopropyl ether (washed previously with water for 4 times) to volume and mix well. Measure accurately 5 ml to another 50 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the two solutions at 302 nm (Appendix IV A) and calculate the content of $C_{14}H_{19}Cl_2NO_2$.

Category As described under Chlorambucil.

Strength 2 mg

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Chloramphenicol

$C_{11}H_{12}Cl_2N_2O_5$ 323.13

[530-43-8]

Chloramphenicol is D-threo-(-)-2,2-dichloro-N-[β -hydroxy- α -(hydroxymethyl)-*p*-nitrophenethyl] acetamide. It contains not less than 98.0% and not more than 102.0% of $C_{11}H_{12}Cl_2N_2O_5$, calculated on the dried basis.

Description A white to slightly yellowish-green crystalline powder, needle crystals or elongated plates; taste, bitter. Freely soluble in methanol, ethanol, acetone or propylene glycol; slightly soluble in water.

Melting point 149-153°C (Appendix VI C).

Specific optical rotation +18.5° to +21.5°, in a solution of 50 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) Dissolve 10 mg in 1 ml of dilute ethanol TS, add 3 ml of 1% calcium chloride solution and 50 mg of zinc powder, heat on a water bath for 10 minutes. To the supernatant liquid add about 0.1 ml of benzoyl chloride, shake thoroughly for one minute, add 0.5 ml of ferric chloride TS and 2 ml of chloroform, mix well; a reddish-violet colour is produced in the aqueous layer. Repeat the test omitting zinc powder; no reddish-violet colour is produced.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of chloramphenicol CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chloramphenicol (Appendix XVI).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity or alkalinity A suspension of 25 mg per ml in water, pH 4.5-7.5 (Appendix VI H).

Relate substances Dissolve an accurately weighed quantity in methanol (add 1 ml of methanol per 10 mg of Chloramphenicol), dilute with mobile phase to produce the test solution of 0.1 mg per ml, mix well. Dissolve an accurately weighed quantity of 1-*p*-nitropheny-2-amino-1,3-prop CRS and *p*-nitrobenzaldehyde CRS in methanol (add 1 ml of methanol per 10 mg of 1-*p*-nitropheny-2-amino-1,3-prop), dilute with mobile phase to produce the mixture solution of 1 μ g per ml for 1-*p*-nitropheny-2-amino-1,3-prop and 0.5 μ g per ml for *p*-nitrobenzaldehyde (the reference solution). Carry out the method as described under Assay. Inject 10 μ l of the reference solution into the column and adjust the attenuation so that 1-*p*-nitropheny-2-amino-1,3-prop peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject accurately 10 μ l of the test solution and the reference solution into the column separately, and record the chromatogram. Calculate the contents of 1-*p*-nitropheny-2-amino-1,3-prop and *p*-nitrobenzaldehyde by the external standard method. The contents of 1-*p*-nitropheny-2-amino-1,3-prop and *p*-nitrobenzaldehyde are not more than 1.0% and 0.5% respectively.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.1% sodium heptanesulfonate solution (mix 500 ml of 0.1% sodium heptanesulfonate solution, 5 ml of dimethylformamide and 0.5 ml of 1% sodium hydroxide solution) as the mobile phase. Detection wavelength is 272 nm. Dissolve Chloramphenicol CRS and 1-*p*-nitropheny-2-amino-1,3-prop CRS in methanol, dilute with mobile phase to produce mixture solution of 50 μ g per ml respectively. Inject 10 μ l into column and record the chromatogram. The number of theoretical plates of the column is less than 1500, calculated with reference to the peak of Chloramphenicol. The resolution factor between the peaks of Chloramphenicol and 1-*p*-nitropheny-2-amino-1,3-prop is not less than 2.0.

Procedure Dissolve about 50 mg, accurately weighed, in 5 ml of methanol, dilute with mobile phase to produce a solution of 0.1 mg per ml, mix well. Inject 10 μ l into column and record the chromatogram. Repeat the operations, using Chloramphenicol CRS instead of the substance being examined. Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$ by the external standard method.

Category Amphenicols of Antibiotic.

Storage Preserve in tightly closed containers.

Preparation (1) Chloramphenicol Capsules
(2) Chloramphenicol Ear Drops
(3) Chloramphenicol Eye Drops
(4) Chloramphenicol Eye Ointment
(5) Chloramphenicol Tablets

Chloramphenicol Capsules

Chloramphenicol Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$).

Description Contents containing white to slightly yellowish-green powder or granule.

Identification (1) The contents of the capsules comply with

the tests (1) for Identification described under Chloramphenicol.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of chloramphenicol CRS.

Loss on drying When dried to constant weight at 105°C, the contents of the capsules lose not more than 1.0% of their weight (Appendix VIII L).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 30 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with hydrochloric acid solution (9→1000) to 50 ml, mix well. Measure the absorbance of the resulting solution at 278 nm (Appendix IV A). Calculate the dissolution of $C_{11}H_{12}Cl_2N_2O_5$ from each capsules, taking 298 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity (equivalent to about 50 mg Chloramphenicol) of mixed contents obtained in the test for weight variation of contents, dissolve in methanol (add 1 ml of methanol per 10 mg of chloramphenicol), dilute with mobile phase to produce a solution of 0.1 mg per ml and filter. Carry out the Assay described under Chloramphenicol using an accurately measured quantity of the successive filtrate.

Category As described under Chloramphenicol.

Strength (1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers.

Chloramphenicol Ear Drops

Chloramphenicol Ear Drops contain not less than 85.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$). Glycerin or propylene glycol may be added as solubilizing agent.

Description A clear colourless to slightly yellow viscous liquid; taste, extremely bitter; miscible with water.

Identification (1) To about 1 ml add 3 ml of 1% calcium chloride solution and 50 mg of zinc powder, heat on a water bath for 10 minutes. To the supernatant liquid add about 0.1 ml of benzoyl chloride, shake thoroughly for one minute, add 0.5 ml of ferric chloride TS and 2 ml of chloroform, mix well; reddish-violet colour is produced in the aqueous layer. (2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of Chloramphenicol CRS.

Related substances Dissolve an accurately weighed quantity in mobile phase to produce the test solution of 0.2 mg per ml. Dissolve an accurately weight of 1-p-nitropheny-2-amino-1,3-prop CRS and p-nitrobenzaldehyde CRS in methanol (and 1 ml of methanol per 10 mg of 1-p-nitropheny-2-amino-1,3-prop), dilute with mobile phase to produce the mixture solution of 8 µg per ml for 1-p-nitropheny-2-amino-1,3-prop and 2 µg per ml for p-nitrobenzaldehyde (the reference solution). Carry out the method as described under Assay. Inject 10 µl of the reference solution into the column and adjust the attenuation so that p-nitrobenzaldehyde peak

height in the chromatogram is 15% of the full scale of the chart. Inject accurately 10 µl of the test solution and the reference solution into the column separately, and record the chromatogram. Calculate the contents of 1-p-nitropheny-2-amino-1, 3-prop and p-nitrobenzaldehyde by the external standard method. The contents of 1-p-nitropheny-2-amino-1, 3-prop and p-nitrobenzaldehyde are not more than 5.0% and 0.5% respectively.

Other requirements Comply with the general requirements for ear preparations (Appendix I Q).

Assay Dissolve an accurately weighed quantity in mobile phase to produce a solution of 0.1 mg per ml and filter. Carry out the Assay described under Chloramphenicol.

Category As described under Chloramphenicol.

Strength 10 ml : 0.25 g

Storage Preserve in tightly closed containers.

Chloramphenicol Eye Drops

Chloramphenicol Eye Drops contain not less than 85.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$). It may contain suitable buffers and preservatives.

Description A clear, colourless or almost colourless liquid.

Identification (1) To 4 ml add 3 ml of 1% calcium chloride solution and 50 mg of zinc powder, heat on a water bath for 10 minutes. To the supernatant liquid add about 0.1 ml of benzoyl chloride shake thoroughly for one minute, add 0.5 ml of ferric chloride TS and 2 ml of chloroform, mix well; a reddish-violet colour is produced in the aqueous layer.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of Chloramphenicol CRS.

pH value 6.0-7.0 (Appendix VI H).

Related substances Dissolve an accurately weighed quantity in mobile phase to produce the test solution of 0.2 mg per ml. Dissolve an accurately weight of 1-p-nitropheny-2-amino-1,3-prop CRS and p-nitrobenzaldehyde CRS in methanol (add 1 ml of methanol per 10 mg of 1-p-nitropheny-2-amino-1,3-prop), dilute with mobile phase to produce the mixture solution of 8 µg per ml for 1-p-nitropheny-2-amino-1,3-prop and 2 µg per ml for p-nitrobenzaldehyde (the reference solution). Carry out the method as described under Assay. Inject 10 µl of the reference solution into the column and adjust the attenuation so that p-nitrobenzaldehyde peak height in the chromatogram is 15% of the full scale of the chart. Inject accurately 10 µl of the test solution and the reference solution into the column separately, and record the chromatogram. Calculate the contents of 1-p-nitropheny-2-amino-1, 3-prop and p-nitrobenzaldehyde by the external standard method. The contents of 1-p-nitropheny-2-amino-1, 3-prop and p-nitrobenzaldehyde are not more than 8.0% and 0.5% respectively.

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Dissolve an accurately weighed quantity in mobile phase to produce a solution of 0.1 mg per ml and filter. Carry out the Assay described under Chloramphenicol.

Category As described under Chloramphenicol.

Strength (1) 5 ml : 12.5 mg (2) 8 ml : 20 mg
(3) 10 ml : 25 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Chloramphenicol Eye Ointment

Chloramphenicol Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$).

Description A pale yellow or yellow eye ointment.

Identification (1) Dissolve about 2 g with 10 ml of dilute ethanol TS by warming and stir in a water bath. Allow it to cool, filter, the filtrate complies with the test (1) for Identification described under Chloramphenicol.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of Chloramphenicol CRS.

Other requirements Complies with the general requirements for eye preparations (Appendix I G).

Assay To about 4 g, accurately weighed, add 30 ml of petroleum ether in a separator, extract with 3 quantities of 20 ml each of phosphate BS (pH 6.0). Dilute the combined extracts to 100 ml with phosphate BS (pH 6.0), mix well. Dissolve an accurately weighed quantity in mobile phase to produce a solution of 0.1 mg per ml and filter. Carry out the Assay described under Chloramphenicol.

Category As described under Chloramphenicol.

Strength (1) 1% (2) 3%

Storage Preserve in tightly closed containers, stored in a cool place.

Chloramphenicol Tablets

Chloramphenicol Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$).

Description Sugar-coated or film coated tablets with white to slightly yellowish-green cores.

Identification (1) Triturate and powder one tablet with coating removed. Shake with 10 ml of ethanol, filter and evaporate the filtrate to dryness. The residue complies with test (1) for Identification described under Chloramphenicol.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of chloramphenicol CRS.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, with hydrochloric acid solution (9→1000) to 50 ml, mix well. Measure the absorbance of the resulting solution at 278 nm (Appendix IV A), calculate the dissolution of $C_{11}H_{12}Cl_2N_2O_5$ from each tablet, taking 298 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity of the powder equivalent to 50 mg Chloramphenicol in methanol (add 1 ml of methanol per 10 mg of chloramphenicol), dilute with mobile phase to produce a solution of 0.1 mg per ml and filter. Carry out the Assay described under Chloramphenicol using an accurately measured quantity of the successive filtrate.

Category As described under Chloramphenicol.

Strength (1) 0.05 g (2) 0.25 g

Storage Preserve in tightly closed containers.

Chloramphenicol Palmitate

$C_{27}H_{42}Cl_2N_2O_6$ 561.55

[530-43-8]

Chloramphenicol Palmitate is D-threo (-) -2,2-dichloro-N- [β-hydroxy-α- (hydroxymethyl) -p-nitrophenethyl] acetamide α-palmitate in the form of polymorph A or B. It contains not less than 56.5% and not more than 59.0% of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$), calculated on the dried basis.

Description A white or almost white powder; almost odourless; tasteless.

Freely soluble in acetone or chloroform; sparingly soluble in ethanol; insoluble in water.

Melting range 89-95°C for polymorph A; 86-91°C for polymorph B, after dried at 60°C for 2 hours (Appendix VI C).

Specific optical rotation +22° to +25°, in a solution of 50 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) The light absorption of a solution of 20 μg per ml in dehydrated ethanol exhibits a maximum at 271 nm. The absorbance is about 0.35 (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) of polymorph A or B is concordant with the reference spectrum of polymorph A or B of chloramphenicol palmitate (Appendix XVI, using mull method).

(3) Dissolve about 0.1 g in 2 ml of ethanolic potassium hydroxide TS, heat in a water bath for 15 minutes, avoid evaporation of ethanol; the solution yields the reactions characteristic of chlorides (Appendix III).

Free palmitic acid Dissolve 1 g in 30 ml of ethanol, previously neutralized to thymol blue, and titrate with sodium hydroxide (0.02 mol/L) VS until the colour changes to green, it contains not more than 2.0% of free palmitic acid ($C_{16}H_{32}O_2$). Each ml of sodium hydroxide (0.02 mol/L) VS is equivalent to 5.128 mg of $C_{16}H_{32}O_2$.

Free chloramphenicol Dissolve about 1 g, accurately weighed, in 80 ml of xylene in a 100 ml conical flask by heat in a water bath, cool, transfer to a separator and extract with three quantities, each of 15 ml, of water. Combine the aqueous extracts, wash with 10 ml of carbon tetrachloride.

Dilute the aqueous solution to 50 ml with water in a 50 ml volumetric flask, mix well and centrifuge. Measure the absorbance of the clear supernatant liquid at 278 nm (Appendix IV A), using a blank solution obtained by repeating the procedure without the substance being examined; the absorbance of the blank solution is not more than 0.05. Calculate the content of free chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$), taking 298 as the value of A (1%, 1 cm); not more than 0.045%.

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight at 60°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve an accurately weighed quantity in dehydrated ethanol to produce a solution of about 25 µg per ml, measure the absorbance at 271 nm (Appendix IV A). Calculate the content of $C_{27}H_{42}Cl_2N_2O_6$, taking 178 as the value of A (1%, 1 cm). The content of $C_{11}H_{12}Cl_2N_2O_5$ is obtained by multiplying the content of $C_{27}H_{42}Cl_2N_2O_6$ with 0.5754.

Category Amphenicols of Antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Chloramphenicol Palmitate (Polymorph B) Granules
(2) Chloramphenicol Palmitate Suspension
(3) Chloramphenicol Palmitate (Polymorph B) Tablets

Chloramphenicol Palmitate (Polymorph B) Granules

Chloramphenicol Palmitate (Polymorph B) Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$) with reference to chloramphenicol palmitate (polymorph B).

Description Suspensible granules; odour, fragrant; taste, sweet.

Identification To 1 g of powdered granules add 30 ml of water, shake thoroughly, filter, wash the residue with water several times and dry under reduced pressure at room temperature, triturate. The residue complies with the tests (2) and (3) for Identification described under Chloramphenicol Palmitate.

Acidity To a quantity add water to produce a suspension of 25 mg per ml, pH 4.5-7.0 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve an accurately weighed quantity of the contents obtained from the test for weight variation of contents, equivalent to 25 mg of chloramphenicol palmitate, in a 100 ml volumetric flask with a quantity of dehydrated ethanol, shake thoroughly, dilute to volume with dehydrated ethanol, mix well and filter. Dilute an accurately quantity of the successive filtrate with dehydrated ethanol to produce a solution of 25 µg per ml. Carry out the method described under Chloramphenicol Palmitate.

Category As described under Chloramphenicol Palmitate.

Strength 0.1 g (calculated as $C_{11}H_{12}Cl_2N_2O_5$)

Storage Preserve in tightly closed containers, protected from light.

Chloramphenicol Palmitate Suspension

Chloramphenicol Palmitate Suspension contains not less than 90.0% and not more than 110.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$).

Description A creamy white suspension; taste, sweet.

Identification (1) Shake about 5 ml with 20 ml of chloroform, separate the chloroform layer, filter and evaporate the filtrate to dryness. Wash the residue thoroughly with water, the residue complies with the tests (1) and (3) for Identification described under Chloramphenicol Palmitate.

(2) The infrared absorption spectrum (Appendix IV C) of the residue obtained in test for Polymorph A is concordant with the reference spectrum of polymorph B of chloramphenicol palmitate (Appendix XVI, using mull method).

Acidity pH 4.5-7.0 (Appendix VI H).

Polymorph A Preparation of reference substances (1) 20% polymorph A CRS: Mix thoroughly one part by weight of chloramphenicol palmitate polymorph A CRS and four parts by weight of chloramphenicol palmitate polymorph B CRS.

(2) 10% polymorph A CRS: Mix thoroughly one part by weight of chloramphenicol palmitate polymorph A CRS and nine parts by weight of chloramphenicol palmitate polymorph B CRS.

Preparation of the test substance To 20 ml of the suspension add 20 ml of water, mix well, centrifuge for 15 minutes, discard the supernatant liquid. Triturate the residue with 2 ml of water to form a paste, add 18 ml of water, shake thoroughly, centrifuge and discard the supernatant liquid. Wash the residue twice more in the same manner. Dry the residue under reduced pressure at room temperature for 14 hours and grind to a fine powder.

Procedure Triturate a small quantity of the test substance and the reference substances respectively with about twice its weight of liquid paraffin until smooth creamy pastes are obtained, mount a small portion of the mull between rock salt plates and record the infrared spectra (Appendix IV C) of each mull over the range of 780-900 cm^{-1} . The transmission of the test substance at 810 cm^{-1} is 20%-30%. On the spectrum of reference substance (1), determine the exact wave number of minimum absorption at about 885 cm^{-1} and 790 cm^{-1} and that of maximum absorption at about 858 cm^{-1} and 843 cm^{-1} . On the spectrum of reference substance (2), draw a straight baseline between the minima occurring at the wave numbers determined above, then draw two lines perpendicular to the baseline at the wave numbers of maxima determined above. Calculate the ratio of the peak height at the maximum at about 858 cm^{-1} to that at the maximum at about 843 cm^{-1} . Carry out the same procedure on the spectrum of the test substance. The ratio of absorbance of the test substance is greater than that of reference substance (2).

Other requirements Complies with the general requirements for suspension (Appendix I O).

Assay Measure accurately 5 ml of the suspension to a 125 ml separator, extract with 25 ml of chloroform, followed by four 20 ml portions. Evaporate the combined extracts to dryness. Dissolve and dilute the residue to 250 ml with dehydrated ethanol, mix well. Measure accurately 10 ml to a

200 ml volumetric flask, dilute with dehydrated ethanol to volume, mix well and carry out the Assay described under Chloramphenicol Palmitate.

Category As described under Chloramphenicol Palmitate.

Strength 1 ml : 25 mg (calculated as $C_{11}H_{12}Cl_2N_2O_5$)

Storage Preserve in tightly closed containers and protected from light.

Chloramphenicol Palmitate (Polymorph B) Tablets

Chloramphenicol Palmitate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$) in the form of polymorph B of chloramphenicol palmitate.

Description White tablets.

Identification (1) Shake thoroughly 5 powdered tablets with 10 ml of water in a centrifuge tube and centrifuge. Discard the supernatant liquid, wash the precipitate in the same manner until the supernatant liquid is practically clear. Dry the precipitate under reduced pressure at room temperature, grind to a fine powder. The infrared absorption spectrum (Appendix IV C) of the powder is concordant with the reference spectrum of polymorph B of chloramphenicol palmitate (Appendix XVI), using mull method.

(2) Comply with the test (3) for Identification described under Chloramphenicol Palmitate, using 1 powdered tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of powder equivalent to about 25 mg of chloramphenicol palmitate, transfer to a 100 ml volumetric flask, shake and dilute to volume with dehydrated ethanol. Filter, dilute a quantity, accurately measured, of the successive filtrate with dehydrated ethanol to produce a solution of 25 μ g per ml. Carry out the Assay described under Chloramphenicol Palmitate.

Category As described under Chloramphenicol Palmitate.

Strength 50 mg (calculated as $C_{11}H_{12}Cl_2N_2O_5$)

Storage Preserve in tightly closed containers and protected from light.

Chloramphenicol Succinate

$C_{15}H_{16}Cl_2N_2O_8$ 423.21

Chloramphenicol Succinate is *D*-threo (-)-2,2-dichloro-*N*-[β -hydroxy- α -(hydroxymethyl)-*p*-nitrophenethyl] acetamide α -succinate. It contains not less than 75.0% and not more than 79.0% of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$), calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Freely soluble in ethanol or acetone; slightly soluble in water; freely soluble in alkali solution.

Melting range 126-131°C (Appendix VI C).

Specific optical rotation +22° to +26° measured at 25°C, in a solution of 50 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) To 50 mg add 5 ml of pyridine and 5 ml of sodium hydroxide TS, shake thoroughly, heat in a water bath for several minutes; the pyridine layer becomes deep red.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chloramphenicol succinate (Appendix XVI).

(3) Dissolve 50 mg in 2 ml of ethanolic potassium hydroxide TS, heat in a water bath for 15 minutes, avoid evaporation of ethanol; the solution yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of solution To 5 portions each of 1.32 g add 5 ml of 4% sodium carbonate solution respectively, the solution are clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solutions YG₅ (Appendix IX A, method 1).

Ethanol insoluble substances Dissolve 0.5 g in 5 ml of ethanol, the solution is clear.

Sulfate Dilute the solution obtained in the test for clarity and colour of solution with 20 ml of water, add 6 ml of dilute hydrochloric acid TS dropwise with shaking, dilute to 50 ml with water, shake thoroughly and filter. Carry out the limit test for sulfates (Appendix VIII B), using 10 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 1.0 ml of potassium sulfate standard solution (0.05%).

Free chloramphenicol Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-methanol-water (9 : 1 : 0.1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions containing (1) 10 mg per ml of the substance being examined in 0.15% sodium carbonate solution and (2) 0.2 mg per ml of chloramphenicol CRS in water. After developing and removal of the plate, dry it in air and examine under ultraviolet light. The colour and the size of any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense or bigger than the principal spot obtained with solution (2).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 0.5% of its weight Appendix VIII L.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in suitable solvent. Transfer the solution into at least 500 ml of 0.9% sterile sodium chloride solutions.

Assay Dissolve an accurately weighed quantity in ethanol to produce a solution of 10 mg per ml, dilute with water to produce a solution of 20 μ g per ml, measure the absorbance at 276 nm (Appendix IV A). Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$, taking 298 as the value of A (1%, 1 cm).

Category Amphenicols of antibiotic.

Storage Preserve in hermetically sealed containers.

Preparation Chloramphenicol Succinate for Injection

Chloramphenicol Succinate for Injection

Chloramphenicol Succinate for Injection is a sterile mixture of Chloramphenicol Succinate and anhydrous sodium carbonate. It contains not less than 95.0% and not more than 105.0% of the labelled amount of chloramphenicol ($C_{11}H_{12}Cl_2N_2O_5$), calculated on the basis of the average weight of contents.

Description A white or almost white powder.

Identification (1) Complies with the tests (1) for Identification described under Chloramphenicol Succinate. (2) The aqueous solution yields the reactions characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve a quantity in water to produce a solution containing 0.2 g of chloramphenicol per ml, pH 6.5-8.5 (Appendix VI H).

Clarity and colour of solution To each of 5 containers add water to produce solutions containing 0.2 g of chloramphenicol per ml by the labelled amount. The solution are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 1.0% of its weight (Appendix VIII L).

Sterility Complies with the test for sterility (Appendix XI H), dissolving each portion in suitable solvent and transferring the solution into at least 500 ml of 0.9% sterile sodium chloride solution.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Weigh accurately a quantity of the contents obtained from the test weight variation of contents, equivalent to about 50 mg of chloramphenicol, dissolve in water to produce a solution of 20 µg per ml. Measure the absorbance at 276 nm (Appendix IV A). Calculate the content of $C_{11}H_{12}Cl_2N_2O_5$, taking 298 as the value of A (1%, 1 cm).

Category As described under Chloramphenicol Succinate.

Strength Calculated as $C_{11}H_{12}Cl_2N_2O_5$
(1) 0.125 g (2) 0.25 g (3) 0.5 g

Storage Preserve in well closed containers.

Chlordiazepoxide

$C_{16}H_{14}ClN_3O$ 299.76

[58-25-3]

Chlordiazepoxide is 7-chloro-N-methyl-5-phenyl-3H-

1,4-benzodiazepine-2-amine-4-oxide. It contains not less than 99.0% of $C_{16}H_{14}ClN_3O$, calculated on the dried basis.

Description A pale yellow crystalline powder; odourless; taste, bitter.

Soluble in ether, chloroform or dichloromethane; slightly soluble in water.

Specific absorbance Measure the absorbance of a solution of 15 µg per ml in hydrochloric acid solution (9→1000) at 308 nm (Appendix IV A), the value of A (1%, 1 cm) is 309-329.

Identification (1) Dissolve 10 mg in 10 ml of hydrochloric acid solution (9→1000), add 1 drop of potassium iodobismuthate TS; an orangish-red precipitate is produced. (2) The light absorption of a solution of 7 µg per ml in hydrochloric acid solution (9→1000) exhibits maxima at 245 nm and 308 nm (Appendix IV A). (3) Dissolve 10 mg in 15 ml of hydrochloric acid solution (1→2), boil gently for 15 minutes and cool. The solution yields the reactions characteristic of primary aromatic amine (Appendix III).

Clarity of acidic solution A solution of 0.50 g in 25 ml of hydrochloric acid solution (9→1000) is clear; any opalescence produced is not more pronounced than that of a reference solution prepared by mixing 10 ml of standard lead solution with 1 ml of 5% sodium bicarbonate solution and 14 ml of water.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.98 mg of $C_{16}H_{14}ClN_3O$.

Category Antianxiety agent and anticonvulsant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlordiazepoxide Tablets

Chlordiazepoxide Tablets

Chlordiazepoxide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of chlordiazepoxide ($C_{16}H_{14}ClN_3O$).

Description Slightly yellow tablets.

Identification Triturate a quantity of powdered tablets equivalent to 0.5 g of chlordiazepoxide with 30 ml of chloroform to dissolve chlordiazepoxide, filter and evaporate the filtrate on a water bath to dryness; the residue complies with the tests for Identification described under Chlordiazepoxide.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet to a 50 ml volumetric flask, add about 30 ml of hydrochloric acid solution (9→1000), shake thoroughly to disperse. Dilute with above hydrochloric acid solution to volume, mix well and filter. Measure accurately 3 ml of successive filtrate to 50 ml volumetric flask, dilute with above hydrochloric acid

solution to volume, mix well. Measure the absorbance of the resulting solution at 308 nm (Appendix IV A), calculate the content of $C_{16}H_{14}ClN_3O$, taking 319 as the value of A (1%, 1 cm).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 800 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm, withdraw 5 ml of the solution after exactly 30 minutes and filter. Measure the absorbance of the filtrate at 308 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{14}ClN_3O$ from each tablet, taking 319 as the value of A (1%, 1 cm), not less than 85% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer a quantity of powdered tablets equivalent to about 30 mg of chlordiazepoxide, accurately weighed, to a 100 ml volumetric flask, add 70 ml of hydrochloric acid solution (9→1000), shake vigorously to dissolve the chlordiazepoxide, dilute with hydrochloric acid solution (9→1000) to volume, mix and filter. Transfer 5 ml of the successive filtrate, accurately measured, to 100 ml volumetric flask, dilute with hydrochloric acid solution (9→1000) to volume and mix well. Measure the absorbance at 308 nm (Appendix IV A) and calculate the content of $C_{16}H_{14}ClN_3O$, taking 319 as the value of A (1%, 1 cm).

Category As described under Chlordiazepoxide.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Chlorhexidine Acetate

$C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O$ 625.56

[56-95-1]

Chlorhexidine Acetate is (*N,N'*-bis (4-chlorophenyl)-3,12-diimino-2,4,11,13-tetra-zatetra-decanecylimidamide, diacetate. It contains not less than 97.5% of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter. Soluble in ethanol; slightly soluble in water.

Identification (1) Dissolve about 10 mg in 5 ml of hot 1% cetrimonium bromide solution, add 1 ml of each of bromine TS and sodium hydroxide TS. A deep red colour is produced.

(2) Dissolve about 10 mg in 10 ml of water, add 2 drops of potassium dichromate TS. A yellow precipitate is produced; which dissolves on addition of a few drops of dilute nitric acid.

(3) The light absorption of a 10 μ g per ml solution in ethanol exhibits a maximum at 259 nm (Appendix IV A).

(4) Its aqueous solution yields the reactions characteristic of acetates (Appendix III).

***p*-Chloroaniline** Dissolve 0.20 g in 10 ml of hydrochloric acid solution (9→100) and 20 ml of water with shaking. Add in sequence 1 ml of 0.5 mol/L sodium nitrite solution and 2 ml of 5% ammonium sulfamate solution, mix well, allow to stand for 5 minutes. Add 5 ml of 0.1% *N*-(1-naphthyl)-ethylenediamine dihydrochloride solution, 1 ml of ethanol and sufficient water to produce 50 ml, mix well, allow to stand for 30 minutes. Any colour produced is not more intense than that of a reference solution prepared in the same manner, using 10 ml of *p*-chloroaniline solution [weigh accurately a quantity of *p*-chloroaniline CRS, add hydrochloric acid solution (9→100) to produce a solution of 10 μ g per ml] (0.05%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using 8 g of silica gel GF₂₅₄ mixed with 22 ml of sodium formate solution (1→22) as the coating substance and a mixture of chloroform-dehydrated ethanol-formic acid (70 : 30 : 9) as the mobile phase. Apply separately to the plate 5 μ l each of three solutions in methanol containing (1) 6 mg per ml, (2) 60 μ g per ml and (3) 120 μ g per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2) and not more than one such spot is more intense than the spot obtained with solution (3).

Loss on drying When dried to constant weight at 105°C, loses not more than 3.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.25 g, accurately weighed, in 30 ml of acetone with shaking, add 0.5-1 ml of a saturated solution of methyl orange in acetone. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to orange. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.28 mg of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O_2$.

Category Antiseptic.

Storage Preserve in tightly closed containers.

Preparation Chlorhexidine Acetate Ointment

Chlorhexidine Acetate Ointment

Chlorhexidine Acetate Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of chlorhexidine acetate ($C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O_2$).

Formula	Chlorhexidine Acetate	5 g
	Borneol	5 g
	Anhydrous Lanolin	40 g
	White Vaseline	901 g
	Ethanol	a quantity
	To make	1000 g

Description A pale yellow or yellow ointment.

Identification (1) Heat about 2 g with 20 ml of ethanol in a water bath to melt the ointment base, stir, cool to room

temperature and filter. To 5 ml of the filtrate in a test tube add slowly alongside the wall the solution of vanillin in sulfuric acid (1→100), a red ring formed at the junction of the two layers.

(2) To 5 ml of the filtrate obtained in the test (1) for Identification add 5 ml of hot 1% cetrimonium bromide solution and 1 ml each of bromine TS and sodium hydroxide TS, an orange colour is produced.

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay Dissolve a quantity of the ointment equivalent to 10 mg of chlorhexidine acetate in 30 ml of slightly warm chloroform in a separator on shaking, extract twice with 20 ml of 1.5 mol/L acetic acid solution, followed by three portions of 15 ml. Combine the extracts to a 100 ml volumetric flask, add 1.5 mol/L acetic acid solution to volume and mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the resulting solution at 260 nm (Appendix IV A). Dissolve about 10 mg of chlorhexidine acetate CRS, accurately weighed, in a 100 ml volumetric flask in a quantity of 1.5 mol/L acetic acid solution and dilute to volume, mix well. Measure accurately 5 ml to a 50 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance of the reference solution in the same manner. Calculate the content of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$.

Category As described under Chlorhexidine Acetate.

Storage Preserve in well closed containers, stored in a cool and dark place.

Chlorhexidine Gluconate Gargle

Chlorhexidine Gluconate Gargle contains not less than 85.0% and not more than 115.0% of the labelled amount of chlorhexidine gluconate ($C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$).

Description A colourless, clear liquid; odour, sweet.

Identification (1) Dissolve 10 ml in a 50 ml volumetric flask with dehydrated ethanol to volume and mix well. The light absorption of the resulting solution exhibits a maximum at 259 nm (Appendix IV A).

(2) To 2 ml add 0.5 ml of ferric chloride TS, heat on a water bath; an orange-yellow colour is produced which changes to yellow on addition of 1 ml of hydrochloric acid.

Assay The gargle is used as the test solution. Dissolve about 10 mg of chlorhexidine acetate CRS, accurately weighed, in 1.5 mol/L acetic acid solution in a 100 ml volumetric flask, dilute to volume and mix well. Measure accurately 25 ml of the test solution and 15 ml of the reference solution into two beakers separately, to the test solution in the beaker add 1.3 ml of glacial acetic acid. To each beaker add 10 ml of 10% cetrimide solution, 4 ml of 3 mol/L sodium hydroxide solution and 30 ml of water, mix well and allow to stand for 30 minutes. Filter into a 100 ml volumetric flask, wash the beaker with 30 ml of water in portions and filter, combine washings and the filtrate. Add 2 ml of a 1% solution of bromine in 10 mol/L sodium hydroxide solution and 1 ml of isopropanol, dilute with water to volume and mix well. Measure the absorbances of the resulting solutions exactly 30 minutes after adding the 1% bromine solution at 476 nm (Appendix IV A). Calculate the content of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$, by multiplying the result by 1.43.

Category As described under Chlorhexidine Gluconate Solution.

Strength (1) 200 ml : 16 mg (2) 500 ml : 40 mg

Storage Preserve in well closed containers, stored in a cool place.

Chlorhexidine Gluconate Solution

Chlorhexidine Gluconate Solution is an aqueous solution of 1,6-bis [N^1 -(*p*-chlorophenyl)- N^5 -biguanido] hexane digluconate. It contains not less than 19.0% (g/ml) and not more than 21.0% (g/ml) of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$.

Description A colourless to pale yellow, almost clear and slightly viscous liquid; odourless or almost odourless. Miscible with water, soluble in ethanol or acetone.

Relative density 1.060-1.070 (Appendix VI A).

Identification (1) To 1 ml add 40 ml of water, cool in an ice bath, add dropwise 20% sodium hydroxide solution to adjust the pH to 12-13 with stirring. Filter, wash the precipitate with cool water until the washings are neutral and recrystallise from 70% ethanol solution, dry at 105°C. The residue melts at 129-134°C, with decomposition (Appendix VI C).

(2) To 0.5 ml add 10 ml of water and 0.5 ml of cupric sulfate TS; a precipitate is produced. Boil to agglomerate the precipitate; a slightly purple colour is produced.

(3) To 0.5 ml add 10 ml of water and 0.5 ml of ferric chloride TS, heat gradually to boiling; a deep orange-red colour is produced which changes to yellow on addition of 1 ml of hydrochloric acid.

(4) To 0.05 ml add 5 ml of hot 1% cetrimide solution, 1 ml of bromine TS and 1 ml of sodium hydroxide TS; a deep red colour is produced.

Acidity Dilute 5 ml to 100 ml with water, pH 5.5-7.0 (Appendix VI H).

***p*-Chloroaniline** Dilute 2.0 ml to 50 ml with water. To 5 ml of the solution add 10 ml of hydrochloric acid solution (9→100) and 20 ml of water. Add 1 ml of 0.5 mol/L sodium nitrite solution and 2 ml of 5% ammonium sulphamate solution, mix well and allow to stand for 5 minutes. Add 5 ml of 0.1% naphthylethylenediamine dihydrochloride solution and 1 ml of ethanol, dilute to 50 ml with water, mix well and allow to stand for 30 minutes. Any colour in the solution is not greater than that in a standard prepared in the same manner using 10.0 ml of a 10 µg/ml solution of *p*-chloroaniline in hydrochloric acid solution (9→100) instead of the dilution of the solution to be examined (0.25%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using 8 g of silica gel GF₂₅₄ mixed with 24 ml of sodium formate solution (1→24) as the coating substance and a mixture of chloroform-dehydrated ethanol-formic acid (60 : 30 : 9) as the mobile phase. Apply separately to the plate 5 µl of each of three solutions in 1.5 mol/L acetic acid solution containing (1) 6 mg per ml, (2) 30 µg per ml and (3) 120 µg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2), and not more than 1-2 such spots are more intense than the principal spot obtained with solution (3).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay To about 1.0 g, accurately weighed, in a 200 ml volumetric flask, add water to volume and mix well. Transfer 1 ml of the solution, accurately measured, to a 100ml volumetric flask, add 5.3 ml of ethanol, dilute with 80% ethanol solution to volume and mix well. Measure the absorbance of the resulting solution at 259 nm (Appendix IV A). Calculate the content of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$, taking 413 as the value of A (1%, 1 cm).

Category Disinfectant.

Strength 250 ml : 50 g

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation (1) Chlorhexidine Gluconate Gargle
(2) Dilute Chlorhexidine Gluconate Solution

Dilute Chlorhexidine Gluconate Solution

Dilute Chlorhexidine Gluconate Solution is an aqueous solution containing 20% Chlorhexidine Gluconate Solution and a quantity of sweetening agent and preservatives. It contains not less than 4.5% (g/ml) and not more than 5.5% (g/ml) of Chlorhexidine Gluconate ($C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$).

Description A colourless to pale yellow liquid with a sweet odour.

Identification (1) To 2 ml add 5 ml of hot 1% cetrimide solution, 1 ml of bromine TS and 1 ml of sodium hydroxide TS; a deep red colour is produced.

(2) To 2 ml add 2 ml of water and 5 drops of cupric sulfate TS; a precipitate is produced. Boil to make the precipitate agglomerate; a slightly purple colour is produced.

(3) To 2 ml add 2 ml of water and 0.5 ml of ferric chloride TS, heat gradually to boiling; a deep orange-red colour is produced which changes to yellow on addition of 1 ml of hydrochloric acid.

pH value pH 5.0-7.0 (Appendix VI H).

Assay Measure accurately 2 ml in a 100 ml volumetric flask, and carry out the Assay described under Chlorhexidine Gluconate Solution beginning at the words "add water to volume...". Calculate the content of $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$.

Category, Storage As described under Chlorhexidine Gluconate Solution.

Strength 250 ml : 12.5 g

Chlormadinone Acetate

$C_{23}H_{29}ClO_4$ 404.93

[302-22-7]

Chlormadinone Acetate is 6-chloro-17 α -hydroxy -pregna-4,6-diene-3,20-dione acetate. It contains not less than 96.0% and not more than 102.0% of $C_{23}H_{29}ClO_4$.

Description A white to pale yellow crystalline powder; odourless; tasteless.

Freely soluble in chloroform; slightly soluble in methanol; sparingly soluble in ethanol; insoluble in water.

Melting range 206-214.5°C (Appendix VI C).

Identification (1) Place a copper wire on flame until it imparts no green flame, cool, add about 1 mg on the copper wire and place on flame again, a green flame is observed.

(2) Dissolve about 0.1 mg on adding about 1 mg of isoniazide and 1 ml of methanol, add 1 drop of dilute hydrochloric acid TS; a yellow colour is produced.

(3) To about 3 mg add about 60 mg of hydroxylamine and 2 ml of methanol, shake to dissolve, add 1 ml of ethanolic solution of potassium hydroxide (2→25), heat in a warm water bath for 30 minutes. Allow it to cool, acidify by adding 5-7 drops of dilute hydrochloric acid TS and then 1 drop of ferric chloride TS; a purplish red colour is produced.

(4) Dissolve a quantity of the substance being examined and chlormadinone acetate CRS in chloroform to prepare solutions of about 20 mg per ml, respectively. Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-dehydrated ethanol (95 : 5) as the mobile phase. Apply 5 ml each of above two solutions to the same plate. After developing and removal of the plate, dry it in air, spray with a mixture of sulfuric acid-dehydrated ethanol (1 : 1) and heat at 105°C to observe the colour of the spots. The colour and position of the principal spots in the chromatograms of the two solutions are identical correspondingly.

(5) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chlormadinone acetate (Appendix XVI).

6 α -Chloro-17 α -hydroxyprogesterone acetate Measure the light absorption of solution obtained in Assay (Appendix IV A), the ratio of absorbance at 240 nm to that at 285 nm is not greater than 0.23.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Dissolve a quantity, accurately weighed, to prepare a solution of 10 mg per ml in ethanol, measure the absorbance (Appendix IV A) at 285 nm, calculate the content of $C_{23}H_{29}ClO_4$, taking the value of A (1%, 1 cm) as 550.

Category Progesteroid.

Storage Preserve in tightly closed containers, protected from light.

Chlormethine Hyd. ochlo. ide

$C_5H_{11}Cl_2N \cdot HCl$ 192.52

[55-86-7]

Chlormethine Hydrochloride is 2-chloro-N-(2-chloroethyl)-N-methyl-ethanamine hydrochloride.

It contains not less than 98.0% of $C_5H_{11}Cl_2N \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder, hygroscopic and corrosive.

Very soluble in water; freely soluble in ethanol.

Melting point 108-111 °C (Appendix VI C).

Identification (1) To 50 mg add 0.5 ml of sodium thiosulfate (0.1 mol/L) VS and 50 mg of sodium bicarbonate, heat the mixture carefully and allow to cool. Acidify with dilute hydrochloric acid, add 1 drop of iodine (0.05 mol/L) VS, the yellow colour does not disappear.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chlormethine hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 50 mg in 25 ml of water, pH 3.0-5.0 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 19.25 mg of $C_5H_{11}Cl_2N \cdot HCl$.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlormethine Hydrochloride Injection

Chlormethine Hydrochloride Injection

Chlormethine Hydrochloride Injection is a sterile solution of Chlormethine Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of chlormethine hydrochloride ($C_5H_{11}Cl_2N \cdot HCl$).

Description A clear, colourless or almost colourless, viscous liquid.

Identification (1) To 2 ml add 10 ml of water and 1 ml of sodium hydroxide TS, extract with ether. Separate the ether extract, add 1 ml of water and 2 drops of dilute hydrochloric acid, evaporate the ether, add 2 drops of mercuric potassium iodide TS, a white opalescence or precipitate is produced immediately.

(2) Yields the reactions characteristic of chlorides (Appendix III).

pH value Dilute 2 ml with 8 ml of water, pH 3.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately with a "to contain" pipet a quantity equivalent to about 0.1 g of chlormethine hydrochloride to a stoppered conical flask, wash the inner wall of the pipet with a small amount of water, transfer the washings into the flask, add 0.1 g of sodium bicarbonate and 20 ml of sodium thiosulfate (0.1 mol/L) VS, accurately

measured. Allow to stand for 2.5 hours, add starch IS and titrate with iodine (0.05 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 9.626 mg of $C_5H_{11}Cl_2N \cdot HCl$.

Category As described under Chlormethine Hydrochloride.

Strength (1) 1 ml : 5 mg (2) 2 ml : 10 mg

Storage Preserve in well closed containers, protected from light.

Chloroquine Phosphate

$C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ 515.87

[50-63-5]

Chloroquine Phosphate is N^4 -(7-chloro-4-quinolinyl)- N' , N' -diethyl-1,4-pentanediamine phosphate (1 : 2). It contains not less than 98.0% of $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter; discoloured slowly on exposure to light. The aqueous solution exhibits acid reaction.

Freely soluble in water; practically insoluble in ethanol, chloroform, ether or benzene.

Melting point 193-196°C, with decomposition (Appendix VI C).

Identification (1) The light absorption of a 10 µg per ml solution in 0.01 mol/L hydrochloric acid exhibits maxima at 222 nm, 257 nm, 329 nm and 343 nm (Appendix IV A).

(2) Dissolve about 0.5 g in 25 ml of water in a separator, add 5 ml of sodium hydroxide TS, extract with 50 ml of ether by shaking, wash the ether layer with water. Filter the ether extract via a filter funnel loaded with anhydrous sodium sulfate, and evaporate to dryness on a water bath. Dry the residue in vacuum over phosphorus pentoxide until the crystals are produced. The infrared absorption spectrum (Appendix IV C) of the crystals is concordant with the reference spectrum of chloroquine (Appendix XVI).

(3) Yields the reactions characteristic of phosphates (Appendix III).

Acidity Dissolve 1.0 g in 10 ml of water, pH 3.5-4.5 (Appendix VI H).

Clarity of solution A solution of 1.0 g in 10 ml of water is clear; or any opalescence produced is not more pronounced than that of the reference suspension II (Appendix IX B).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-cyclohexane-diethylamine (5 : 4 : 1) as the mobile phase. Apply separately to the plate 2 µl each of three solutions in water containing (1) 50 mg per ml, (2) 1.0 mg per ml and (3) 0.25 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). No spot other than the principal spot in the chromatogram obtained with

solution (1) is more intense than the spot obtained with solution (2) and not more than one such spot may be more intense than the spot obtained with solution (3).

Loss on drying When dried to constant weight at 120°C, loses not more than 3.0% of its weight (Appendix VIII L).

Heavy metals Moisten 1.0 g with 1 ml of sulfuric acid in a silica crucible. Ignite gently until no fumes of sulfur trioxide appear. Add 0.5 ml of nitric acid and again ignite until no fumes of nitrogen oxide appear. Then ignite at 500-600°C until all the carbon is burned off. Cool, carry out the limit test for heavy metals (Appendix VIII H, method 2): not more than 0.002%.

Arsenic Mix 0.40 g with 1.0 g of calcium hydroxide, triturate with small quantities of water. Allow to dry, ignite gently to carbonize and then ignite at 500-600°C until all the carbon is burned off. Cool, dissolve in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1): not more than 0.0005%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.79 mg of $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$.

Category Antimalarial and antiamebiasis.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Chloroquine Phosphate Injection
(2) Chloroquine Phosphate Tablets

Chloroquine Phosphate Injection

Chloroquine Phosphate Injection is a sterile solution of Chloroquine Phosphate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of chloroquine phosphate ($C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To 1 ml add 20 ml of water and 10 ml of trinitrophenol TS; a precipitate is produced. The melting point of the precipitate, after washing with small portions of water and drying at 105°C, is about 207°C (Appendix IV C).

(2) Yields the reactions characteristic of phosphates (Appendix III).

pH value 3.5-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity equivalent to about 0.3 g of chloroquine phosphate to 30 ml with water, add 3 ml of 20% sodium hydroxide solution, mix well. Extract with four 20 ml portions of ether. Wash the combined ether extracts with 10 ml of water, and extract the aqueous layer with 15 ml of ether. Combine the ether extracts and evaporate to a volume of about 2-3 ml. Add 25 ml, accurately measured, of hydrochloric acid (0.1 mol/L) VS, heat gently to remove ether and to dissolve the residue, and cool. Add several drops of bromocresol green IS, and titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of hydrochloric acid (0.1 mol/L) VS is equivalent to 25.79 mg of $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$.

Category As described under Chloroquine Phosphate.

Strength 5 ml : 322 mg

Storage Preserve in well closed containers, protected from light.

Chloroquine Phosphate Tablets

Chloroquine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of chloroquine phosphate ($C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$).

Description White tablets or sugar-coated tablets with white core.

Identification Dissolve a quantity of the powdered tablets equivalent to about 0.5 g of chloroquine phosphate in 20 ml of water with shaking, filter. The filtrate complies with the test for Identification described under Chloroquine Phosphate.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter, measure accurately 5 ml of the successive filtrate, dilute with the dissolution medium to produce a solution of 13 µg per ml and mix well. Measure the absorbance of the resulting solution at 343 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ from each tablet, taking 371 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 0.13 g of chloroquine phosphate into 200 ml volumetric flask, dissolve in 0.1 mol/L hydrochloric acid solution and dilute to volume, mix well and filter. Accurately measure 2 ml of the successive filtrate to a 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well. Measure the absorbance of the resulting solution at 343 nm (Appendix IV A). Dissolve an accurately weighed quantity of chloroquine phosphate CRS in 0.1 mol/L hydrochloric acid solution and dilute to produce a solution of 13 µg per ml. Repeat the operation. Calculate the content of $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$.

Category As described under Chloroquine Phosphate.

Strength (1) 0.075 g (2) 0.1 g (3) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Chlorotrianisene

$C_{23}H_{21}ClO_3$ 380.87

[569-57-3]

Chlorotrianisene is 1, 1', 1''-(1-chloro-1-ethenyl)-

2-ylidene) tris (4-methoxybenzene). It contains not less than 98.0% and not more than 102.0% of $C_{23}H_{21}ClO_3$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless.

Freely soluble in chloroform, benzene or acetone; soluble in ether; slightly soluble in methanol or ethanol; practically insoluble in water.

Melting range 114-120°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 10 mg in a test tube in 2 ml of sulfuric acid, an intense violet colour is produced; the solution changes immediately to light red and becomes turbid on adding 5 ml of water; add cautiously 2 ml of sulfuric acid along the test tube wall, a violet-red colour is produced at the junction of the two layers and the colour changes into light red again after shaking.

(2) To about 5 mg add 0.2 ml of glacial acetic acid and 1 ml of phosphoric acid, heat on a water bath for 3 minutes, a pink colour is produced; the colour disappears immediately on adding 3 ml of glacial acetic acid again.

(3) The light absorption of a about 10 µg per ml solution in ethanol exhibits maxima at 247 nm and 307 nm, the absorbance is about 0.62 to 0.65 and 0.40 to 0.42, respectively (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Chlorotrianisene (Appendix XVI).

Chloride To 0.50 g add 20 ml of water, shake for 10 minutes, filter. Carry out the limit test for chlorides (Appendix VIII A), using 10 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.02%).

Loss on drying When dried to constant weight at 80°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.5 g, accurately weighed, in 15 ml of dehydrated ethanol by heating gently under reflux in a 250 ml conical flask. Add 2.0 g of metallic sodium, a small piece at a time, through the inlet of the condenser. Continue to reflux for 1 hour, shake occasionally. Add 25 ml of dehydrated ethanol and allow the excess metallic sodium to react completely. Heat for 15 minutes more, add 70 ml of water and allow to cool. To the solution add 15 ml of nitric acid and 25 ml of silver nitrate (0.01 mol/L) VS, accurately measured, shake well. Allow to stand for 10 minutes, filter, wash the flask and the precipitate with 80 ml of water in portions. Combine the filtrate and washings, add 3 ml of ferric ammonium sulfate IS and titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 38.09 mg of $C_{23}H_{21}ClO_3$.

Category Estrogen.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlorotrianisene Pills

Chlorotrianisene Pills

Chlorotrianisene Pills contain not less than 85.0%

and not more than 115.0% of the labelled amount of chlorotrianisene ($C_{23}H_{21}ClO_3$).

Description White or creamy white dripping pills.

Identification (1) Comply with tests (1) and (2) for Identification described under Chlorotrianisene.

(2) The light absorption of the solution obtained in the Assay exhibits maxima at 247 nm and 307 nm (Appendix IV A).

Other requirements Comply with the general requirements for dripping pills (Appendix I H).

Assay Place 10 pills in a 200 ml volumetric flask, heat with a quantity of ethanol in a water bath at 65°C. Cool, dilute with ethanol to volume and mix well. Transfer 5 ml, accurately measured, into a 100 ml volumetric flask, dilute with ethanol to volume and mix well. Measure the absorbance at 307 nm (Appendix IV A). Calculate the content of $C_{23}H_{21}ClO_3$, taking 420 as the value of A (1%, 1 cm).

Category As described under Chlorotrianisene.

Strength 4 mg

Storage Preserve in tightly closed containers.

Chlorphenamine Maleate

$C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ 390.87 [113-92-8]

Chlorphenamine Maleate is 2-[p-chloro-α-[2-(dimethyl)ethyl]phenyl]pyridine maleate. It contains not less than 98.5% of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Freely soluble in water, ethanol or chloroform; slightly soluble in ether.

Melting range 131.5-135°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 20 µg per ml in hydrochloric acid solution (1→100) at 264 nm (Appendix IV A), the value of A (1%, 1 cm) is 212-222.

Identification (1) To 10 mg add 1 ml of citric acid-acetic anhydride TS, heat on a water bath; a reddish-purple colour is produced.

(2) To about 20 mg add 1 ml of dilute sulfuric acid, add dropwise potassium permanganate TS; the solution remains colourless.

(3) The infrared absorbance spectrum (Appendix IV C) is concordant with the reference spectrum of chlorphenamine maleate (Appendix XVI).

Acidity Dissolve 0.1 g in 10 ml of water, pH 4.0-5.0 (Appendix VI H).

Related substances Carry out the method for gas chromatography (Appendix V E). The support is white diatomaceous earth, use 3% of phenyl (50%) methyl

silicone as the liquid stationary phase, and maintain the column temperature at 190°C, using a column with 1.2 m long. Dissolve 0.4 g of chlorphenamine maleate in 10 ml of methylene chloride, using as the test solution. Measure accurately 1 ml of above solution and dilute with methylene chloride to 100 ml, using as reference solution. Inject 1 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of the full scale of the chart. Inject separately 1 µl each of the test and reference solution into the column and record the chromatogram for twice the retention time of the principal peak. The sum of peak areas due to impurities is not greater than twice of the principal peak area of the reference solution.

Tetrahydrofuran, dioxane pyridine and toluene Carry out the method for determination of organic solvent residue (Appendix VIII P, method 3). Use porous polymer beads of divinyl-ethylvinylbenzene cross-linked as the stationary phase; maintain the column temperature at 190°C. Measure accurately a quantity of benzene in methanol to produce a solution of 60 µg per ml as the internal solution. Measure accurately a quantity of tetrahydrofuran, dioxane, pyridine, and toluene in methanol to produce solutions of 720 µg per ml, 380 µg per ml, 200 µg per ml and 890 µg per ml as the reference preparation solutions respectively. Measure accurately 1 ml each of the internal and reference preparation solution in 10 ml volumetric flask, dilute with water to the volume and mix well, as the reference solution. Weigh accurately 1.0 g of chlorphenamine maleate to 10 ml volumetric flask, add 1 ml of internal solution and dilute with water to the volume, mix well as the test solution. The contents of solvent residue comply with the related requirements.

Readily carbonizable substances Carry out the limit test for readily carbonizable substances (Appendix VIII K), using 25 mg. Any colour produced is not more intense than that of reference solution Y₁.

Loss on drying when dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 19.54 mg of C₁₆H₁₉ClN₂ · C₄H₄O₄.

Category Antihistaminic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Chlorphenamine Maleate Injection
(2) Chlorphenamine Maleate Pills
(3) Chlorphenamine Maleate Tablets

Chlorphenamine Maleate Injection

Chlorphenamine Maleate Injection is a sterile solution of Chlorphenamine Maleate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of chlorphenamine maleate (C₁₆H₁₉ClN₂ · C₄H₄O₄).

Description A clear, colourless liquid.

Identification Evaporate a quantity equivalent to about 30 mg of chlorphenamine maleate on a water bath to dryness, the residue complies with tests (1) and (2) for Identification described under Chlorphenamine Maleate.

pH value 4.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure the absorbance of a solution containing 20 µg per ml in hydrochloric acid solution (1→100) at 264 nm (Appendix IV A), calculate the content of C₁₆H₁₉ClN₂ · C₄H₄O₄, taking 217 as the value of A (1%, 1 cm).

Category As described under Chlorphenamine Maleate.

Strength (1) 1 ml : 10 mg (2) 2 ml : 20 mg

Storage Preserve in well closed containers, protected from light.

Chlorphenamine Maleate Pills

Chlorphenamine Maleate Pills contain not less than 93.0% and not more than 107.0% of the labelled amount of chlorphenamine maleate (C₁₆H₁₉ClN₂ · C₄H₄O₄).

Formula	Chlorphenamine maleate	4 g
	Macrogl 6000	15.5 g
	to make	1000 pills or 2000 pills

Description White or almost white dripping pills.

Identification (1) To a quantity of pills equivalent to about 8 mg of chlorphenamine maleate add 1 ml of citric acid acetic anhydride TS, heat on a water bath, a reddish violet colour is produced.

(2) To a quantity of pills equivalent to about 20 mg of chlorphenamine maleate add 2 ml of dilute sulfuric acid, then add dropwise potassium permanganate TS, the solution remains colourless.

(3) Dissolve a quantity of pills equivalent to 4 mg of chlorphenamine maleate in 1 ml of chloroform (solution 1). Dissolve a quantity of chlorphenamine maleate CRS in chloroform to produce a solution of 4 mg per ml (solution 2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-methanol-dilute acetic acid (5 : 3 : 2) as the mobile phase. Apply separately to the plate 3 µl each of the two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with solution (1) corresponds to that of the principal spot obtained with solution (2).

Content uniformity Comply with the requirements (Appendix X E). Shake thoroughly 1 pill with 50 ml of water in a 200 ml volumetric flask to dissolve chlorphenamine maleate, add 2 ml of dilute hydrochloric acid, and dilute with water to volume, mix well, allow to stand, measure the absorbance of the lower layer of the solution at 264 nm, calculate the content of C₁₆H₁₉ClN₂ · C₄H₄O₄ in each pill, taking 217 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for dripping pills (Appendix I H).

Assay Shake thoroughly a quantity of pills equivalent to about 40 mg of chlorphenamine maleate with 50 ml of water in a 100 ml volumetric flask to dissolve chlorphenamine

maleate, dilute with water to volume, mix well, allow to stand. Measure accurately 10 ml of the lower layer solution to a 200 ml volumetric flask, add 2 ml of dilute hydrochloric acid, dilute with water to volume, mix well. Measure the absorbance at 264 nm (Appendix IV A), calculate the content of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$, taking 217 as the value of A (1%, 1 cm).

Category As described under Chlorphenamine Maleate.

Strength (1) 2 mg (2) 4 mg

Storage Preserve in tightly closed containers, protected from light, and stored in a cool place.

Chlorphenamine Maleate Tablets

Chlorphenamine Maleate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of chlorphenamine maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 8 mg of chlorphenamine maleate add 4 ml of water, stir and filter. Evaporate the filtrate to dryness, the residue complies with test (1) for Identification described under Chlorphenamine Maleate.

(2) To a quantity of the powdered tablets equivalent to about 20 mg of chlorphenamine maleate add 2 ml of dilute sulfuric acid, stir and filter. To the filtrate add dropwise potassium permanganate TS, the solution remains colourless.

(3) Extract a quantity of the powdered tablets equivalent to about 5 mg of chlorphenamine maleate with chloroform and filter. Evaporate the filtrate to dryness and dissolve the residue in 1 ml of chloroform (solution 1). To a quantity of chlorphenamine maleate CRS add chloroform to produce a solution containing 5 mg per ml (solution 2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-methanol-dilute acetic acid (5 : 3 : 2) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with solution (1) are identical to those of the principal spot obtained with solution (2).

Content uniformity Comply with the requirements (Appendix X E). Transfer 1 tablet to a 200 ml volumetric flask, add 50 ml of water, shake thoroughly to disperse, add 2 ml of dilute hydrochloric acid and dilute with water to volume. Proceed as directed under Assay. Calculate the content of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ in each tablet.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 2.5 ml of dilute hydrochloric acid diluted with water to 250 ml as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Measure the absorbance of the successive filtrate at 264 nm (Appendix IV A). Calculate the dissolution of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ from each tablet, taking 217 as the value of A (1%, 1 cm), not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Transfer an accurately weighed quantity equivalent to about 4 mg of

chlorphenamine maleate to a 200 ml volumetric flask, add 2 ml of dilute hydrochloric acid and a quantity of water with shaking to dissolve chlorphenamine maleate, dilute with water to volume and mix well. Allow to stand and filter. Measure the absorbance of the successive filtrate at 264 nm (Appendix IV A) and calculate the content of $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$, taking 217 as the value of A (1%, 1 cm).

Category As described under Chlorphenamine Maleate.

Strength 4 mg

Storage Preserve in tightly closed containers, protected from light.

Chlorpromazine Hydrochloride

$C_{17}H_{19}ClN_2S \cdot HCl$ 355.33

[69-09-0]

Chlorpromazine Hydrochloride is 2-chloro-*N*, *N*-dimethyl-10*H*-phenothiazine-10-propanamine monohydrochloride. It contains not less than 99.0% of $C_{17}H_{19}ClN_2S \cdot HCl$, calculated on the dried basis.

Description A white or creamy white crystalline powder; odour, slight; taste, very bitter; hygroscopic; discoloured slowly on exposure to light. The aqueous solution exhibits acid reaction.

Freely soluble in water, ethanol or chloroform; insoluble in ether or benzene.

Melting range 194-198°C (Appendix VI C).

Identification (1) To 10 mg add 1 ml of water and 5 drops of nitric acid; a red colour develops which turns to pale yellow on standing.

(2) The light absorption of a solution of 5 μ g per ml in hydrochloric acid solution (9→1000) exhibits maxima at 254 nm and 306 nm; the absorbance at 254 nm is about 0.46 (Appendix IV A).

(3) The infrared absorbance spectrum (Appendix IV C) is concordant with the reference spectrum of chlorpromazine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of solution A solution of 0.50 g in 10 ml of water is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B) and any colour produced is not more intense than that of reference solution Y₃ or YG₃ (Appendix IX A, method 1).

Related substances Protect from light throughout the procedure. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of cyclohexane-acetone-diethylamine (80 : 10 : 10) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 10 mg per ml, (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and view under an ultraviolet light (254 nm). Any spot other than the principal spot in the

chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of acetic anhydride, add 5 ml of mercuric acetate TS and 1 drop of orange IV IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to rose-red. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 35.53 mg of $C_{17}H_{19}ClN_2S \cdot HCl$.

Category Antipsychotic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Chlorpromazine Hydrochloride Injection
(2) Chlorpromazine Hydrochloride Tablets

Chlorpromazine Hydrochloride Injection

Chlorpromazine Hydrochloride Injection is a sterile solution of Chlorpromazine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Complies with test (1) for Identification described under Chlorpromazine Hydrochloride, using a quantity equivalent to 10 mg of chlorpromazine hydrochloride.

(2) Complies with test (2) for Identification described under Chlorpromazine Hydrochloride, using the solution obtained in the Assay.

pH value 3.0-5.0 (Appendix VI H).

Related substances Protect from light throughout the procedure.

Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of cyclohexane-acetone-diethylamine (80 : 10 : 10) as the mobile phase. Apply separately to the plate 10 µl each of three solutions in methanol containing (1) 20 mg per ml, (2) 1.0 mg per ml and (3) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intensely coloured than the principal spot obtained with solution (3) and not more than one spot in the chromatogram is more intense than the principal spot obtained with solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Protect from light throughout the procedure. Measure accurately a quantity equivalent to 50 mg of chlorpromazine hydrochloride in a 250 ml volumetric flask, dilute with hydrochloric acid solution (9 → 1000) to volume and mix well. Place 10 ml, measure accurately, in a 50 ml volumetric flask, dilute with hydrochloric acid solution (9 → 1000) to volume. Measure the absorbance of the resulting solution at 306

nm (Appendix IV A). Calculate the content of $C_{17}H_{19}ClN_2S \cdot HCl$, taking 115 as the value of A (1%, 1 cm).

Category As described under Chlorpromazine Hydrochloride.

Strength (1) 1 ml : 10 mg (2) 1 ml : 25 mg
(3) 2 ml : 50 mg

Storage Preserve in well closed containers, protected from light.

Chlorpromazine Hydrochloride Tablets

Chlorpromazine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of chlorpromazine hydrochloride ($C_{17}H_{19}ClN_2S \cdot HCl$).

Description Sugar-coated tablets with white cores.

Identification Weigh a quantity of powdered tablets with coating removed, equivalent to 50 mg of chlorpromazine hydrochloride, dissolve in 5 ml of water and filter. The filtrate complies with tests (1) and (4) for Identification described under Chlorpromazine Hydrochloride.

Related substances Protect from light throughout the procedure. Dissolve a quantity of powdered tablets equivalent to 0.1 g of chlorpromazine Hydrochloride in 10 ml of methanol and filter, use the successive filtrate as solution (1). Dilute 1 volume of solution (1) to 100 volumes with methanol to produce solution (2). Comply with the test for Related substances described under Chlorpromazine Hydrochloride, beginning at the words "after developing and removal of the plate."

Dissolution Protect from light throughout the procedure. Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of water as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter, measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with hydrochloric acid solution (9 → 1000) to volume and mix well. Measure the absorbance at 254 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{19}ClN_2S \cdot HCl$ from each tablet, taking 915 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh accurately and powder 10 tablets with coating removed. Weigh accurately a quantity of powder equivalent to about 10 mg of chlorpromazine hydrochloride into a 100 ml volumetric flask and dissolve with shaking in 70 ml of hydrochloric acid solution (9 → 1000), dilute to volume with the same solvent, shake well and filter. Measure accurately 5 ml of the successive filtrate into 100 ml volumetric flask, dilute to volume with the same solvent, mix well. Measure the absorbance of the resulting solution at 254 nm (Appendix IV A). Calculate the content of $C_{17}H_{19}ClN_2S \cdot HCl$, taking 915 as the value of A (1%, 1 cm).

Category As described under Chlorpromazine Hydrochloride.

Strength (1) 12.5 mg (2) 25 mg (3) 50 mg

Storage Preserve in tightly closed containers, protected from light.

Chlorpropamide

$C_{10}H_{13}ClN_2O_3S$ 276.74

[94-20-2]

Chlorpropamide is 4-chloro-*N* [(propylamino) carbonyl]-benzenesulfonamide. It contains not less than 99.0% of $C_{10}H_{13}ClN_2O_3S$, calculated on the dried basis.

Description A white crystalline powder; odourless, or almost odourless; taste, slightly bitter. Freely soluble in chloroform; soluble in ethanol; insoluble in water; freely soluble in alkali hydroxide solutions.

Melting range 125-130°C (Appendix VI C).

Identification (1) Boil about 0.1 g with 8 ml of 50% (g/g) sulfuric acid under a reflux condenser for 30 minutes, cool and filter. Render the filtrate alkaline with 20% sodium hydroxide solution and heat, an ammoniacal odour is perceptible.

(2) Heat 0.1 g with 1 g of anhydrous sodium carbonate to a dull red, continue to heat for 10 minutes. Cool, dissolve the residue in water, filter, acidify the filtrate with nitric acid and add 1 ml of silver nitrate TS; a white precipitate is produced.

(3) Dissolve 0.12 g in methanol to produce 50 ml, dilute 1 ml to 200 ml with 0.01 mol/L hydrochloric acid solution and mix well. The light absorption of the solution exhibits a maximum at 232 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chlorpropamide (Appendix XVI).

Clarity and colour of alkaline solution Dissolve 1.0 g in 5 ml of sodium hydroxide TS, add 20 ml of water. The solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1).

Loss on drying When dried to constant weight at 80°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 3), using 0.50 g; not more than 0.002%.

Assay Dissolve about 0.6 g, accurately weighed, in 20 ml of ethanol previously neutralized to phenolphthalein IS, add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 27.67 mg of $C_{10}H_{13}ClN_2O_3S$.

Category Antidiabetic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlorpropamide Tablets

Chlorpropamide Tablets

Chlorpropamide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of chlorpropamide ($C_{10}H_{13}ClN_2O_3S$).

Description White tablets.

Identification Extract a quantity of powdered tablets equivalent to about 0.5 g of chlorpropamide with five quantities of 4 ml of acetone, filter, evaporate the filtrate to dryness on a water bath. The residue complies with the tests for Identification described under Chlorpropamide.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets, carry out the Assay described under Chlorpropamide, using a quantity of powdered tablets equivalent to about 0.3 g of chlorpropamide, accurately weighed. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 27.67 mg of $C_{10}H_{13}ClN_2O_3S$.

Category As described under Chlorpropamide.

Strength (1) 0.1 g (2) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Chlorprothixene

$C_{18}H_{18}ClNS$ 315.87

[113-59-7]

Chlorprothixene is (*Z*)-2-chloro-*N*, *N*-dimethylthioxanthene-1-propylamine. It contains not less than 98.0% of $C_{18}H_{18}ClNS$, calculated on the dried basis.

Description A pale yellow crystalline powder; odourless; tasteless.

Freely soluble in chloroform; insoluble in water.

Melting point 96-99°C (Appendix VI C).

Identification (1) To about 10 mg add 2 ml of nitric acid, a light red solution is produced. Dilute the solution with 5 ml of water, the solution exhibits a green fluorescence under ultraviolet light.

(2) The light absorption of a solution of about 50 µg per ml in hydrochloric acid solution (9→1000) exhibits a maximum at 324 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chlorprothixene (Appendix XVI).

Loss on drying When dried over phosphorous pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.25 g, accurately weighed, in 20 ml of glacial acetic acid, 1 ml of perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.59 mg of $C_{18}H_{18}ClNS$.

Category Antipsychotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlorprothixene Tablets

Chlorprothixene Tablets

Chlorprothixene Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of chlorprothixene ($C_{18}H_{18}ClNS$).

Description Sugar-coated tablets with almost white to pale yellow cores.

Identification To a quantity of powdered tablets, equivalent to about 0.1 g of chlorprothixene, add 5 ml of chloroform and stir to dissolve chlorprothixene. Filter and evaporate the filtrate to dryness. The residue complies with the tests (1) and (2) for Identification described under Chlorprothixene.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of about 50 µg per ml. Dissolve an accurately weighed quantity of chlorprothixene CRS in the dissolution medium to produce a solution of 50 µg per ml. Measure the absorbance of the two solutions at 324 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{18}ClNS$ from each tablet; not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 0.25 g of chlorprothixene, to a conical flask with stopper. Add 20 ml of chloroform and shake for 10 minutes, allow to stand for 30 minutes. Filter through a tared sintered glass funnel, wash the residue 3 times with chloroform, each of 10 ml. Combine the chloroform, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.59 mg of $C_{18}H_{18}ClNS$.

Category As described under chlorprothixene.

Strength (1) 12.5 mg (2) 15 mg (3) 25 mg (4) 50 mg

Storage Preserve in tightly closed containers, protected from light.

Chlortalidone

$C_{14}H_{11}ClN_2O_4S$ 338.76

[77-36-1]

Chlortalidone is 2-chloro-5-(2,3-dihydroxy-1-hydroxy-3-oxo-1H-indol-1-yl)-benzenesulphonamide. It contains not less than 98.0% of $C_{14}H_{11}ClN_2O_4S$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless.

Soluble in methanol or acetone; slightly soluble in ethanol; practically insoluble in water, ether or chloroform.

Melting range 214–220°C, with decomposition (Appendix VI C)

Identification (1) To 50 mg add 3 ml of sulfuric acid, a deep yellow colour is produced immediately.

(2) The light absorption of a solution of 0.1 mg per ml in ethanol exhibits two maxima at 275 nm and 284 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of chlortalidone (Appendix XVI).

Chloride Shake 0.50 g with 50 ml of water for 5 minutes and filter, carry out the limit test for chlorides (Appendix VIII A), using 20 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 7.0 ml of sodium chloride standard solution (0.035%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of dioxane-isopropanol-toluene-concentrated ammonia solution (30 : 30 : 30 : 20) as the mobile phase. Apply separately to the plate 10 µl of each of two solutions in acetone containing (1) 20 mg per ml and (2) 0.20 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Any spot other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.01 mol/L diammonium hydrogen phosphate solution-methanol (3 : 2) as the mobile phase (adjust to pH 5.5 with phosphoric acid). Detection wavelength is 254 nm and the number of the

theoretical plates of the column is not less than 1500, calculated with reference to the peak of chlortalidone.

Procedure Dissolve a quantity accurately weighed, in a small amount of methanol, dilute with a mixture of water-methanol (3 : 2) to produce a solution of 0.1 mg per ml. Inject 20 μ l into the column and record the chromatogram. Repeat the operation using chlortalidone CRS instead of the substance being examined, calculate the content of $C_{14}H_{11}ClN_2O_4S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Diuretic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Chlortalidone Tablets

Chlortalidone Tablets

Chlortalidone Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of chlortalidone ($C_{14}H_{11}ClN_2O_4S$).

Description White tablets.

Identification (1) To a quantity of powdered tablets, equivalent to about 20 mg of chlortalidone add 1 ml of sulfuric acid, a deep yellow colour is produced which is discoloured on diluting with water.

(2) To a quantity of powdered tablets, equivalent to about 50 mg of chlortalidone, add 1 g of sodium hydroxide, heat gently until melted, ammonia vapour is evolved which turns the moistened alkaline mercuric potassium iodide IP to brownish yellow colour. The residue yields the reactions characteristic of sulfites (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium. Adjust the rotational speed of the paddle to 100 rpm. Withdraw 10 ml of the solution after exactly 60 minutes and filter, use the successive filtrate as the test preparation. Dissolve an accurately weighted quantity of chlortalidone CRS in water to produce a solution of 0.1 mg per ml (for 100 mg strength) or 0.05 mg per ml (for 50 mg strength) as reference preparation. Measure the absorbance of the resulting solutions at 275 nm (Appendix IV A). Calculate the dissolution of $C_{14}H_{11}ClN_2O_4S$ from each tablet; not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Boil a quantity of the powder containing 0.1 g of chlortalidone under a reflux condenser with 30 ml methanol for 5 minutes, shake vigorously for 15 minutes, cool and filter. Wash the residue with methanol and combine the filtrate and washings, dilute with methanol to 100 ml and mix well. Measure accurately 5 ml to a 50 ml volumetric flask, add 2 ml of hydrochloric acid solution (9 \rightarrow 100), dilute with methanol to volume and mix well. Measure the absorbance of the resulting solution at 275 nm (Appendix IV A). Dissolve an accurately weighed quantity of chlortalidone CRS in methanol to produce a solution of 1 mg per ml, repeat the operation beginning at the words "Measure accurately 5 ml to a 50 ml volumetric flask". Calculate the content of $C_{14}H_{11}ClN_2O_4S$.

Category As described under Chlortalidone.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, protected

from light.

Chlortetracycline Hydrochloride

$C_{22}H_{23}ClN_2O_8 \cdot HCl$ 515.35

[64-72-2]

Chlortetracycline Hydrochloride is 7-chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacene-carboxamide monohydro-chloride. It contains not less than 91.0% of $C_{22}H_{23}ClN_2O_8 \cdot HCl$, calculated on the dried basis.

Description Golden yellow or yellow crystals; odourless; taste, bitter; darkened on exposure to light. Slightly soluble in water or ethanol; practically insoluble in acetone, ether or chloroform.

Specific optical rotation -235° to -250° , measured at $25^\circ C$ in a solution of 5 mg per ml in water (Appendix VI E). Keep the solution in the dark for 30 minutes before measurement.

Identification (1) To about 0.5 mg add 2 ml of sulfuric acid, a blue colour is produced, which gradually becomes bluish-green; then add 1 ml of water, a golden yellow or brownish-yellow colour is produced.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of chlortetracycline hydrochloride CRS in the chromatogram.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Chlortetracycline (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity An aqueous solution of 5 mg per ml, pH 2.3-3.3 (Appendix VI H).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined, accurately weighed, in 0.01 mol/L hydrochloric acid solution to produce solutions of 1 mg per ml as test solution. Dissolve an accurately weighed quantity of tetracycline hydrochloride CRS and epimer of chlortetracycline in 0.1 mol/L hydrochloric acid to produce a solution of 0.08 mg tetracycline hydrochloride and 0.04 mg epimer of chlortetracycline per ml as reference solution. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject separately 20 μ l each of test solution and reference solution into the column and record the chromatogram for 1.5 times the retention time of the principal peak. Each peak area of epimer of chlortetracycline and tetracycline hydrochloride is not greater than 4% and 8% of the area of the principal peak in the chromatogram obtained with reference solution respectively.

Light absorption of impurity The absorbance of a solution of 5 mg per ml in water at 460 nm (Appendix IV A) is not more than 0.40.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid (Appendix V D), using a column packed with octadecylsilane bonded silica gel (pH more than 8) and a mixture of 0.1 mol/L ammonium oxalate solution-dimethylformamide-0.2 mol/L diammonium hydrogen phosphate solution (68 : 27 : 5) (adjust to pH 8.3 with ammonia TS) as the mobile phase with a flow rate 1.3 ml per minute, maintain the column temperature at 40-50°C. Detection wavelength is 370 nm. The resolution factor between the peaks of epimer of chlortetracycline and tetracycline hydrochloride and that between tetracycline hydrochloride and chlortetracycline hydrochloride comply with related requirements. (elution sequence; epimer of chlortetracycline, tetracycline hydrochloride and chlortetracycline hydrochloride except solvent peak).

Procedure Dissolve about 25 mg, accurately weighed, in 0.01 mol/L hydrochloric acid and dilute to volume in a 50 ml volumetric flask, mix well. Inject 20 µl into the column and record the chromatogram. Repeat the operation, using chlortetracycline hydrochloride CRS instead of the substance being examined, calculate the content of $C_{22}H_{23}ClN_2O_8 \cdot HCl$.

Category Tetracycline antibiotic.

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Preparation (1) Chlortetracycline Hydrochloride Eye Ointment
(2) Chlortetracycline Hydrochloride Ointment

Chlortetracycline Hydrochloride Eye Ointment

Chlortetracycline Hydrochloride Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of chlortetracycline, calculated as chlortetracycline hydrochloride ($C_{22}H_{23}ClN_2O_8 \cdot HCl$).

Description A yellow ointment.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of chlortetracycline hydrochloride CRS in the chromatogram.

Other requirements Complies with the general requirements for eye preparations (Appendix I G).

Assay Dissolve as completely as possible about 2 g, accurately weighed, in 25 ml of ether in a separator, extract with 3 portions each of 10 ml of 0.1 mol/L hydrochloric acid solution. Combine the extracts in 50 ml volumetric flask, dilute with water to volume. Dissolve 20 mg of chlortetracycline hydrochloride CRS, weighed accurately, in 0.01 mol/L hydrochloric acid solution and dilute to volume in a 100 ml volumetric flask, mix well. Carry out the Assay described under Chlortetracycline Hydrochloride with the resulting solutions.

Category As described under Chlortetracycline Hydrochloride.

Strength 0.5%

Storage Preserve in well closed containers, stored in a cool and dry place.

Chlortetracycline Hydrochloride Ointment

Chlortetracycline Hydrochloride Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of chlortetracycline, calculated on chlortetracycline hydrochloride ($C_{22}H_{23}ClN_2O_8 \cdot HCl$).

Description A yellow ointment.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak of chlortetracycline hydrochloride CRS.

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay Dissolve about 1 g, accurately weighed, in 25 ml of ether in a separator with shaking, extract with 3 portions each of 10 ml of 0.1 mol/L hydrochloric acid solution. Combine the extracts and dilute to volume in a 50 ml volumetric flask. Dissolve about 20 mg of chlortetracycline hydrochloride CRS, weighed accurately, in 0.01 mol/L hydrochloric acid solution and dilute to volume in a 100 ml volumetric flask, mix well. Carry out the Assay described under Chlortetracycline Hydrochloride with the resulting solutions.

Category As described under Chlortetracycline Hydrochloride.

Strength 1%

Storage Preserve in well closed containers, store in a cool and dry place.

Choline Theophyllinate

$C_{12}H_{21}N_5O_3$ 283.33

[13930-27-3]

Choline Theophyllinate is salt of 2-hydroxy-*N,N,N*-trimethyl-ethanamine with 3,7-dihydro-1,3-dimethyl-1*H*-purine-2,6-dione. It contains not less than 98.5% of $C_{12}H_{21}N_5O_3$, calculated on the dried basis.

Description A white, crystalline powder; odour, faintly amine-like; taste, salty and bitter. Freely soluble in water; soluble in ethanol; slightly soluble in chloroform or ether.

Melting range 187-192°C (Appendix VI C, regulate the rate of temperature rise to 3.0°C ± 0.5°C per minute).

Identification (1) Dissolve about 0.1 g in 1 ml of hydrochloric acid, add 0.1 g of potassium chlorate, evaporate to dryness on a water bath, the residue becomes purple on exposure to ammonia vapour, and then discharged on the addition of sodium hydroxide TS.

(2) Dissolve 0.5 g in 2 ml of water, add 3 ml of sodium hydroxide TS, boil, the odour of trimethylamine is perceptible.

(3) The light absorption of a solution of 15 µg per ml in sodium hydroxide (0.01 mol/L) VS exhibits a maximum at 275 nm (Appendix IV A).

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear; any colour produced is not more intense than that of the reference solution (to 1.0 ml of standard potassium dichromate CS add water to produce 160 ml).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.25 g, accurately weighed, in 50 ml of water and 8 ml of ammonia TS by heating gently on a water bath. Add accurately 20 ml of silver nitrate (0.1 mol/L) VS, mix well, heat again on a water bath for 15 minutes, cool to 5–10°C and allow to stand for 20 minutes. Filter through a sintered glass funnel, wash the residue with three 10 ml portions of water. Combine the filtrate and the washings, acidify with nitric acid and then add 3 ml more of nitric acid, cool, add 2 ml of ammonium ferric sulfate IS. Titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 28.33 mg of $C_{12}H_{21}N_5O_3$.

Category Smooth muscle relaxant.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Choline Theophyllinate Tablets

Choline Theophyllinate Tablets

Choline Theophyllinate Tablets contain not less than 94.0% and not more than 106.0% of the labelled amount of choline theophyllinate ($C_{12}H_{21}N_5O_3$).

Description White tablets.

Identification Macerate a quantity of the powdered tablets with water, filter, the filtrate complies with tests (1) and (2) for Identification described under Choline Theophyllinate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 20 tablets. Weigh accurately a quantity of the powder equivalent to about 0.5 g of choline theophyllinate to a 100 ml volumetric flask, add 70 ml of water, shake frequently for 30 minutes to dissolve choline theophyllinate, add water to volume and mix well. Filter, measure accurately 50 ml of the successive filtrate and add 8 ml of ammonia TS. Heat gently on a water bath, carry out the Assay described under Choline Theophyllinate, beginning at the words "Add accurately 20 ml...". Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 28.33 mg of $C_{12}H_{21}N_5O_3$.

Category As described under Choline Theophyllinate.

Strength 0.1 g

Storage Preserve in tightly closed containers, stored in a dry place.

Chorionic Gonadotrophin

Chorionic Gonadotrophin is a gonad-stimulating hormone obtained from the urine of pregnant women. It has a potency not less than 2500 Units per mg, calculated on the dried basis.

The manufacturing process must have been shown to reduce any viral contamination such as hepatitis virus or HIV by appropriate validated methods.

Description A white or almost white powder.

Soluble in water; insoluble in ethanol, acetone or ether.

Oestrogens Three female mice weighing between 18 and 20 g are ovariectomized two to three weeks before the test. On the day of the test, inject subcutaneously into each of three mice a Sodium Chloride Injection containing 1250 Units per ml in four equally-divided doses, each of 0.2 ml, on three consecutive days. Inject the doses in the afternoon of the first day, in the morning and afternoon of the second day, and in the morning of the third day. The vaginal smears taken in the morning of the fourth, fifth and sixth days from each mouse by washing the vaginal wall with a small quantity of Sodium Chloride Injection show no signs of positive response under the low power microscope. The response is positive when most of the cells present in any of the smears are cornified or nucleated cells, but leucocytes are absent or scanty.

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 3.0% of its weight (Appendix VIII L), use about 0.1 g.

Undue toxicity Complies with the test for undue toxicity by intravenous injection (Appendix XI C), using 2000 Units dissolved in 1 ml of Sodium Chloride Injection.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); less than 0.01 EU per unit.

Assay Carry out the biological assay of chorionic gonadotrophin (Appendix XIII E), the estimated potency is not less than 80% and not more than 125% of the labelled potency.

Category Gonad-stimulant.

Storage Preserve in tightly closed containers, stored in a cool and dark place.

Preparation Chorionic Gonadotrophin for Injection

Chorionic Gonadotrophin for Injection

Chorionic Gonadotrophin for Injection is a sterile, lyophilized preparation of chorionic gonadotrophin containing suitable excipient. It has a potency of not less than 80% and not more than 125% of the labelled potency.

Description A white, lyophilized mass or powder.

Loss on drying When dried in vacuum over phosphorus pentoxide to constant weight, loses not more than 5.0% of its weight (Appendix VIII L), use 0.1 g.

Sterility Dissolve the contents of 2 ampoules separately in sterile water to produce a solution of 250 Units per ml, the solution complies with the test for sterility (Appendix XI H).

Undue toxicity and Bacterial endotoxin Complies with the corresponding test described under Chorionic Gonadotrophin.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the biological assay of chorionic gonadotrophin (Appendix XIII E), it complies with the requirement for potency.

Category As described under Chorionic Gonadotrophin.

Strength (1) 500 Units (2) 1000 Units (3) 2000 Units
(4) 3000 Units (5) 5000 Units

Storage Preserve in well closed containers, stored in a cool and dark place.

Chymotrypsin

Chymotrypsin is a proteolytic enzyme obtained by extraction of cattle or swine pancreas. It has a potency of not less than 800 Units per mg, calculated on the dried basis.

Description A white or almost white crystalline powder.

Identification Prepare an aqueous solution of 1 mg per ml. To 0.05 ml on a white spot plate add 0.2 ml of *N*-acetyl-L-tyrosin ethyl ester TS and mix well, a purple colour is produced.

Acidity An aqueous solution of 2 mg per ml, pH 5.5-7.0 (Appendix VI H).

Clarity of solution An aqueous solution of 2 mg per ml is clear.

Trypsin Prepare an aqueous solution of 10 mg per ml as the test solution. To 50 μ l of the test solution and 5 μ l of a solution of 0.1% trypsin CRS respectively in separate depressions on a white spot plate add 0.2 ml each of methyl *N*-tosyl-L-arginate hydrochloride TS. Allow it to stand, no purple colour appears in the test solution before that appears in the solution of trypsin CRS (1%).

Loss on drying When dried to constant weight over phosphorus pentoxide under reduced pressure at 60°C for 4 hours, loses not more than 5.0% of its weight (Appendix VIII L), using about 0.2 g.

Residue on ignition Not more than 2.5% (Appendix VIII N).

Assay *Test solution* Dissolve a quantity, accurately weighed, in 0.0012 mol/L hydrochloric acid solution to produce a solution of 12-16 Units per ml.

Substrate solution Transfer 23.7 mg of ethyl *N*-acetyl-L-tyrosin in a 100 ml volumetric flask, add 50 ml of phosphate buffer solution (mix 38.9 ml of 0.067 mol/L potassium dihydrogen phosphate solution with 61.1 ml of disodium hydrogen phosphate solution, adjust to pH 7.0), dissolve by warming, cool, dilute to volume and shake thoroughly. Store by freezing but avoid to thaw repeatedly.

Procedure Adjust the light absorption of a mixture of 0.2 ml of 0.0012 mol/L hydrochloric acid solution and 3.0 ml of the substrate solution to have an absorbance of 0.200, measured at 237 nm at 25°C \pm 0.5°C. Mix well 0.2 ml of the test solution with 3.0 ml of the substrate solution and measure the absorbance immediately. Measure the absorbance at an interval of 30 seconds for a period of 5 minutes. The changing rate of the absorbances is constant

within a period of not less than 3 minutes. Repeat the operation under the same condition. If the changing rate does not keep constant as required, repeat the measurement using the test solution of a lower concentration. The changing rate of the absorbance at an interval of 30 seconds should be kept in the range of 0.008-0.012. Plot a graph with absorbance as the ordinate and time as the abscissa, taking the linear part measured within 3 minutes. Calculate the activity from the following expression:

$$\text{Chymotrypsin Unit per mg } P = \frac{A_2 - A_1}{0.0075TW}$$

Where A_2 is the initial absorbance of the straight line;

A_1 is the final absorbance of the straight line;

T is the time taken in minutes from A_2 to A_1 ;

W is the quantity of the substance being examined in the test solution, mg;

0.0075 represents the change of absorbance equivalent to 1 Unit of chymotrypsin under the above condition.

Category Proteolytic enzyme.

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Preparation Chymotrypsin for Injection

Chymotrypsin for Injection

Chymotrypsin for Injection is sterile, lyophilized chymotrypsin. It contains not less than 90.0% and not more than 120.0% of the labelled potency.

Description White lyophilized masses.

Identification An aqueous solution of 800 Units per ml complies with the test for Identification described under Chymotrypsin.

Acidity Dissolve the contents of each of 5 containers separately in 2 ml of water, combine the solutions and mix well, pH 5.5-6.5 (Appendix VI H).

Colour of solution Dissolve in 2 ml of water, the solution is almost colourless.

Loss on drying When dried to constant weight over phosphorus pentoxide under reduced pressure at 60°C for 4 hours, loses not more than 8.0% of its weight (Appendix VIII L), using about 0.2 g.

Other requirements Complies with the general requirements for injections (Appendix I B), except Weight variation of contents.

Assay Dissolve the contents of 3 containers separately in 0.0012 mol/L hydrochloric acid solution to produce solutions containing 12-16 Units per ml. Carry out the Assay described under chymotrypsin and calculate the activity. If one of them fails, repeat the assay using the other three containers, all of them comply with the requirement.

Category As described under Chymotrypsin.

Strength (1) 800 Units (2) 4000 Units

Storage Preserve in well closed containers, protected from light and stored in a cool place.

Ciclopirox Olamine

$C_{12}H_{17}NO_2 \cdot C_2H_7NO$ 268.36

[41621-49-2]

Ciclopirox Olamine is a double salt composed of 4-methyl-6-hexyl-1-hydroxyl-2(1*H*)-pyridone and 2-aminoethanol. It contains not less than 75.7% and not more than 78.0% of $C_{12}H_{17}NO_2$; not less than 22.3% and not more than 23.0% of C_2H_7NO , calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter.

Freely soluble in methanol, ethanol or chloroform; sparingly soluble in dimethylformamide or water; slightly soluble in ethyl ether.

Identification (1) Dissolve 10 mg in 5 ml of water, add two drops of ninhydrin TS and boil; a bluish-violet colour is produced.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of benzene-ethanol-glacial acetic acid-dimethylformamide (90 : 8 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 40 mg per ml of ciclopirox olamine CRS and (2) 40 mg per ml of substance being examined. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm). The fluorescence of the principal spot in the chromatogram obtained with solution (2) is identical in colour and position with that in the chromatogram obtained with solution (1).

(3) The light absorption of a solution of 20 μ g per ml in ethanol exhibits maxima at 304 nm and 231 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ciclopirox olamine (Appendix XVI).

Alkalinity The pH value of a solution of 10 mg per ml in water is 8.0-9.0 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for residue on ignition; not more than 0.002%.

Assay *Ciclopirox* Dissolve about 0.3 g, accurately weighed, in 40 ml of dimethylformamide, add two drops of 1% thymol blue in methanol IS. Titrate with lithium methoxide (0.1 mol/L) VS until a blue colour is produced. Perform a blank determination and make any necessary correction. Each ml of lithium methoxide (0.1 mol/ml) VS is equivalent to 20.73 mg of $C_{12}H_{17}NO_2$.

2-Aminoethanol Dissolve about 0.3 g, accurately weighed, in 20 ml of methanol, add three drops of bromocresol green IS. Titrate with hydrochloric acid (0.1 mol/L) VS until a

yellow colour is produced. Perform a blank determination and make any necessary correction. Each ml of hydrochloric acid (0.1 mol/ml) VS is equivalent to 6.108 mg of C_2H_7NO .

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light.

Preparation Ciclopirox Olamine Cream

Ciclopirox Olamine Cream

Ciclopirox Olamine Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of ciclopirox olamine ($C_{12}H_{17}NO_2 \cdot C_2H_7NO$).

Description A creamy white cream.

Identification (1) To 0.1 g add 2 ml of ninhydrin TS, stir and boil; a bluish-violet colour is produced.

(2) To 4 g add 10 ml of methanol, warm on a water bath to dissolve ciclopirox olamine, then cool on water bath and filter. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of benzene-ethanol-glacial acetic acid-dimethyl formamide (90 : 8 : 1 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 4 mg per ml of ciclopirox olamine CRS and (2) the filtrate of the substance being examined. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm). The fluorescence of the principal spot in the chromatography obtained with solution (2) is identical in colour and position with that in the chromatography obtained with solution (1).

(3) To 0.1 g add 50 ml of ethanol; shake and filter. The light absorption of the filtrate exhibits maxima at 304 nm and 231 nm (Appendix IV A).

Acidity and alkalinity To about 3.5 g add 15 ml of boiling water (pH = 6-7), stir and heat in water bath for 10 minutes, then cool. The pH value of the solution is 5.0-8.0 (Appendix VI H).

Assay *Reference preparation* Dissolve 30 mg of ciclopirox olamine CRS in a 100 ml volumetric flask with methanol and dilute to volume and mix well.

Test preparation To a quantity, weight accurately, equivalent to about 30 mg of ciclopirox olamine, add 25 ml methanol, warm on water bath to dissolve ciclopirox olamine; cool with ice water and filter. Extract for three times according to the procedure above mentioned. Combine the filtrate in a 100 ml volumetric flask and add methanol to volume.

Procedure Transfer 5 ml of each of the two solutions, accurately measured, to two 25 ml of volumetric flasks, add 15 ml of methanol each and mix well. Add 1.5 ml of ferrous sulfate solution (Dissolve 0.6 g of ferrous sulfate in 0.6 ml of glacial acetic acid and a quantity of water, dilute to 25 ml and mix well) to each of the two flask and mix well; then add methanol to volume, mix well again, and protect from light for 1 hour. Measure the absorbance of the resulting solutions at 440 nm (Appendix IV A), calculate the content of $C_{12}H_{17}NO_2 \cdot C_2H_7NO$.

Category As described under Ciclopirox Olamine.

Strength (1) 10 g : 0.1 g (2) 15 g : 0.15 g

Storage Preserve in tightly closed containers, protected from light, stored at a cool place.

Cimetidine

$C_{10}H_{16}N_6S$ 252.34

[51481-61-9]

Cimetidine is *N*-cyano-*N'*-methyl-*N''*-[2-[(5-methyl-1*H*-imidazol-4-yl) methyl] thio] ethyl] guanidine. It contains not less than 99.0% of $C_{10}H_{16}N_6S$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless; taste, bitter.

Freely soluble in methanol; soluble in ethanol; sparingly soluble in isopropanol; slightly soluble in water; freely soluble in dilute hydrochloric acid.

Specific Absorbance Measure the absorbance of a solution of 8 μ g per ml in hydrochloric acid (0.9 \rightarrow 1000) at 218 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 751-797.

Identification (1) Dissolve about 50 mg in 10 ml of water by warming, add 1 drop of ammonia TS and 2 drops of cupric sulphate TS, a bluish-grey precipitate is produced, which is soluble in an excess of ammonia TS.

(2) Ignite about 50 mg, fumes are evolved which stain lead acetate TP black.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cimetidine (Appendix XVI).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 1.0 g. Any opalescence produced is not more pronounced than that of a reference using 8 ml of sodium chloride standard solution (0.008%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (5 : 1 : 1) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in methanol containing (1) 20 mg per ml and (2) 0.1 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and visualize with iodine vapour. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals, using the residue obtained in the test for Residue on ignition (Appendix VIII H, method 2); not more than 0.001%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.23 mg of $C_{10}H_{16}N_6S$.

Category Histamine H_2 receptor antagonist.

Storage Preserve in tightly closed containers.

Preparation (1) Cimetidine and Sodium Chloride Injection
(2) Cimetidine Capsules
(3) Cimetidine Tablets

Cimetidine and Sodium Chloride Injection

Cimetidine and Sodium Chloride Injection is a sterile solution of Cimetidine and Sodium Chloride in Water for Injections. It contains not less than 90.0% and not more than 110.0% of the labelled amount of cimetidine ($C_{10}H_{16}N_6S$), sodium chloride (NaCl).

Description A clear, colourless liquid.

Identification (1) To a quantity of the injection (equivalent to about 50 mg of cimetidine), add two drops of ammonia TS and two drops of copper sulfate TS, a bluish-grey precipitate is produced, add excessive ammonia TS; the precipitate is dissolved.

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of cimetidine CRS in the chromatogram of the reference solution.

(3) Yield the reactions characteristic of sodium salts and chloride (Appendix III).

pH value 5.0-7.0 (Appendix VI H).

Particulate matter in Injection Complies with the requirements (Appendix IX C).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E), less than 0.5 EU per ml.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay of Cimetidine Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water-phosphoric acid-triethylamine (200 : 800 : 0.3 : 0.2) as mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of cimetidine.

Procedure Transfer an accurately measured 5 ml of the injection to a 100 ml volumetric flask and dilute with the mobile phase to volume, mix well, transfer 5 ml of the solution into a 20 ml volumetric flask, accurately measured, dilute with the mobile phase to volume and mix well. Inject 10 μ l of the resulting solution into the column. Dissolve an accurately weighed quantity of cimetidine CRS in the mobile phase to produce a solution of 50 μ g per ml, repeat the operation. Calculate the content of $C_{10}H_{16}N_6S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Sodium chloride *Stock reference solution* Measure accurately a quantity of standard sodium solution, dilute with water to produce a solution of 100 μ g per ml.

The test solution Transfer an accurately measured 5 ml of the injection to a 50 ml volumetric flask and dilute with water to volume, mix well, transfer 1 ml of the solution to a 50 ml volumetric flask, accurately measured, dilute with water to volume, mix well.

Procedure Transfer separately 3.5 ml, 5.5 ml, 7.0 ml, 8.5 ml and 10.5 ml of the stock reference solution to five 100

ml volumetric flasks, accurately measured, dilute with water to volume, mix well. Carry out the method for flame spectrophotometry (Appendix IV F), measure the absorbance of above solutions and the test solution. Calculate the content of NaCl.

Category As described under cimetidine.

Strength (1) 50 ml : 0.2 g of cimetidine and 0.45 g of sodium chloride (2) 100 ml : 0.4 g of and 0.9 g of sodium chloride

Storage Preserve in well closed containers and protected from light.

Cimetidine Capsules

Cimetidine Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cimetidine ($C_{10}H_{16}N_6S$).

Identification The contents of the capsules comply with the tests for Identification described under Cimetidine Tablets.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (0.9→1000) as the dissolution medium and adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 20 minutes and filter. Dilute accurately measured 3 ml of the successive filtrate with dissolution medium to volume in a 100 ml volumetric flask. Measure the absorbance of the resulting solutions at 218 nm (Appendix IV A). Calculate the dissolution of $C_{10}H_{16}N_6S$ from each capsule, taking 774 as the value of A (1%, 1 cm), not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity, equivalent to about 0.1 g of cimetidine, of the mixed contents in the test for Weight variation of contents in 150 ml of hydrochloric acid solution (0.9→1000) with shaking and dilute with above hydrochloric acid solution to volume in a 200 ml volumetric flask, mix well and filter. Dilute accurately measured 2 ml of the successive filtrate to volume in a 200 ml volumetric flask with above hydrochloric acid solution and mix well. Measure the absorbance of the resulting solution at 218 nm (Appendix IV A), calculate the content of $C_{10}H_{16}N_6S$, taking 774 as the value of A (1%, 1 cm).

Category As described under Cimetidine.

Strength 0.2 g

Storage Preserve in tightly closed containers.

Cimetidine Tablets

Cimetidine Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of cimetidine ($C_{10}H_{16}N_6S$).

Description White tablets or faintly blue or greyish-green coloured tablets with the addition of pigment or film coated tablets.

Identification (1) Ignite a quantity of powdered tablets equivalent to about 0.1 g of cimetidine, fumes are evolved which stain lead acetate TP black.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol (5 : 1) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in methanol containing (1) 10 mg per ml of the substance being examined and (2) 10 mg per ml of cimetidine CRS. After developing and removal of the plate, dry it in air and visualize with iodine vapour. The principal spot in the chromatogram obtained with solution (1) is identical in position with the principal spot obtained with solution (2).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (0.9→1000) as the dissolution medium, and adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 15 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with dissolution medium to produce a solution of 5-10 μ g per ml. Measure the absorbance of the solution at 218 nm (Appendix IV A), calculate the dissolution of $C_{10}H_{16}N_6S$ from each tablet, taking 774 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powdered tablets equivalent to about 0.2 g in 150 ml of hydrochloric acid solution (0.9→1000) with shaking and dilute with above solvent to volume in a 200 ml volumetric flask, mix well and filter. Dilute accurately measured 2 ml of the successive filtrate to volume in a 200 ml volumetric flask with above solvent and mix well. Measure the absorbance of the resulting solution at 218 nm (Appendix IV A), calculate the content of $C_{10}H_{16}N_6S$, taking 774 as the value of A (1%, 1 cm).

Category As described under Cimetidine.

Strength (1) 0.2 g (2) 0.4 g (3) 0.8 g

Storage Preserve in tightly closed containers.

Cinnarizine

$C_{26}H_{28}N_2$ 368.52

[298-57-7]

Cinnarizine is 1-(diphenylmethyl)-4-(3-phenyl-2-propenyl)-piperazine. It contains not less than 98.0% of $C_{26}H_{28}N_2$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; tasteless.

Freely soluble in chloroform or benzene; soluble in boiling ethanol; practically insoluble in water.

Melting range 117-121°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 7.5 μ g per ml in hydrochloric acid solution (9→1000) at 253 nm (Appendix IV A), the value of A (1%, 1 cm) is 558-592.

Identification (1) Dissolve about 20 mg in 5 ml of ethanol by warming, add 2 drops of potassium hydroxide TS, mix well. Add 2-3 drops of potassium permanganate TS, the violet colour is immediately discharged.

(2) To about 10 mg add several drops of a 2% solution of formaldehyde in sulfuric acid, a red colour is produced.

(3) Ignite about 50 mg in a test tube. Fumes are evolved which turn a piece of filter paper moistened with 2% trichloroacetic acid solution and 1 drop of a 5% solution of *p*-dimethylaminobenzaldehyde in hydrochloric acid to violet.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cinnarizine (Appendix XVI).

Alkalinity Shake 0.50 g with 20 ml of freshly boiled and cooled water for 5 minutes and filter. To the filtrate add 1 drop of methyl orange IS and 0.50 ml sulfuric acid (0.01 mol/L) VS, a red colour is produced.

Chloride Heat 0.20 g with 25 ml of water on a water bath for 10 minutes, shake thoroughly and filter. Collect the filtrate in a 50 ml volumetric flask, dilute with water to volume, mix well. Carry out the limit test for chlorides (Appendix VIII A), using 10 ml of the filtrate, accurately measured. Any opalescence produced is not more pronounced than that of a reference using 4.0 ml of sodium chloride standard solution (0.1%).

Loss on drying When dried to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid and 4 ml of acetic anhydride, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.43 mg of $C_{26}H_{28}N_2$.

Category Vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Cinnarizine Capsules
(2) Cinnarizine Tablets

Cinnarizine Capsules

Cinnarizine Capsules contain not less than 93.0% and not more than 107.0% of the labelled amount of cinnarizine ($C_{26}H_{28}N_2$).

Identification To a quantity of the contents of the capsules, equivalent to about 0.25 g of cinnarizine, add 25 ml of ethanol to dissolve cinnarizine with warming. Filter and evaporate the filtrate to dryness, the residue complies with tests (1), (2) and (3) for Identification described under Cinnarizine.

Dissolution Comply with the dissolution test (Appendix X C, method 1). Complete the Dissolution as described under Cinnarizine Tablets.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation, equivalent to about 30 mg of cinnarizine. Carry out the Assay described under Cinnarizine Tablets, beginning at the words "in about 150 ml..."

Category As described under Cinnarizine.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Cinnarizine Tablets

Cinnarizine Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of cinnarizine ($C_{26}H_{28}N_2$).

Description White or almost white tablets.

Identification (1) Dissolve a quantity of powdered tablets equivalent to about 0.25 g of cinnarizine in 25 ml of ethanol by warming and filter. Evaporate the filtrate to dryness, the residue complies with tests (1), (2) and (3) for Identification described under Cinnarizine.

Dissolution Carry out dissolution test (Appendix X C, method 1), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, and adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute 5 ml of the successive filtrate, accurately measured, in a 10 ml volumetric flask with dissolution medium to volume, mix well. Measure the absorbance of the solution at 253 nm (Appendix IV A), calculate the dissolution of $C_{26}H_{28}N_2$, taking 575 as the value of A (1%, 1 cm). Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity equivalent to about 30 mg of cinnarizine in about 150 ml of hydrochloric acid solution (9→1000) in a 200 ml volumetric flask with shaking, and dilute to volume, shake well, filter. Dilute accurately measured 5 ml of the successive filtrate with hydrochloric acid solution (9→1000) in a 100 ml volumetric flask to volume, mix well. Measure the absorbance of the solution at 253 nm (Appendix IV A). Calculate the content of $C_{26}H_{28}N_2$, taking 575 as the value of A (1%, 1 cm).

Category As described under Cinnarizine.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Ciprofloxacin

$C_{17}H_{18}FN_3O_3$ 331.34

Ciprofloxacin is 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid. It contains not less than 98.5% and not more than 102.0% of $C_{17}H_{18}FN_3O_3$, calculated on the anhydrous basis.

Description White or slightly yellow crystalline powder; almost odourless; taste, bitter. Freely Soluble in acetic acid; very slightly soluble in ethanol and chloroform; practically insoluble in water.

Identification (1) The retention time of principal peak of ciprofloxacin in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of the ciprofloxacin CRS in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ciprofloxacin (Appendix XVI).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Clarity and colour of solution A solution of 0.1 g in 10 ml of hydrochloric acid (0.1 mol/L) is clear and colourless; if any colour is produced, its colour is not more intense than reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Fluoroquinolinic acid Carry out the method for thin-layer chromatography (Appendix V B). Dilute a quantity with 0.1 mol/L hydrochloric acid to produce a solution containing 10 mg per ml as test solution; add about 5.0 mg Fluoroquinolinic acid in 50 ml measuring flask, then dissolve in 0.05 ml of 6 mol/L ammonia solution and water, dilute to volume. Shake thoroughly, dilute an accurately measured quantity with water to produce a solution containing 0.03 mg per ml as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and chloroform: methanol: concentrated ammonia solution: Acetonitrile (4 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 5 μ l, put it into ammonia for 15 minutes. After developing and removal of the plate, allow it to dry in air and examine under ultra-violet light (254 nm). The spots of Fluoroquinolinic acid and ciprofloxacin are separated thoroughly. Any spot obtained with test solution is not more intense than the principal spot obtained with reference solution (0.3%).

Related substances Dissolve a quantity in 7% phosphate acid 0.2 ml, dilute with mobile phase to produce a test solution of 0.5 mg per ml. Dilute an accurately measured quantity with mobile phase to produce a reference solution of 1 μ g per ml. Carry out the method for Assay. Inject 50 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% full scale of the chart. Measure accurately 50 μ l of test solution and reference solution into the column respectively and record the chromatogram for twice the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained from the test solution are not greater than 0.2% and 2.5 times (0.5%) of area of the principal peak in the chromatogram obtained with the reference solution. Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 120°C for 6 hours, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII

N), using 1.0 g in a platinum crucible.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L citric acid solution-acetonitrile (82 : 18) with a pH value adjusted to pH 3.5 by triethylamine as the mobile phase. The flow rate is 1 ml per minute; maintain the column temperature at 30°C. The number of theoretical plate of the column is not less than 2000, calculated with reference to the peak of ciprofloxacin. Detection wavelength is 277 nm. The resolution factor between the peaks of ciprofloxacin and continuous impurity complies with the related requirements.

Procedure Dissolve about 25 mg of ciprofloxacin, accurately weighed, in 7% phosphate acid solution in a 50 ml volumetric flask, diluted with mobile phase to volume and mix well. Measure accurately 10 μ l into the column and record the chromatogram. Repeat the operation, using ciprofloxacin CRS instead of the substance. Calculate the content of ciprofloxacin ($C_{17}H_{18}FN_3O_3$) with respect to the peak area obtained in the chromatogram by the external standard method.

Category Aminoglycoside Antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Ciprofloxacin Lactate and Sodium Chloride Injection.

Ciprofloxacin Hydrochloride

$C_{17}H_{18}FN_3O_3 \cdot HCl \cdot H_2O$, 385.82

Ciprofloxacin Hydrochloride is 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid hydrochloride monohydrate. It contains not less than 88.5% of $C_{17}H_{18}FN_3O_3$, calculated on the anhydrous basis.

Description A white to slightly yellow crystalline powder; almost odourless; taste, bitter. Soluble in water; slightly soluble in methanol; very slightly soluble in ethanol; sparingly soluble in 0.1 mol/L hydrochloric acid.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ciprofloxacin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ciprofloxacin hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity An aqueous solution of 25 mg per ml, pH 3.0-4.5 (Appendix VI H).

Clarity and colour of solution Dissolve 0.1 g in 10 ml of water, the solution is clear; any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Fluoroquinolonic acid Dissolve a quantity of the substance being examined in water to produce a solution of 10 mg per ml (solution 1). Dissolve 5.0 mg of fluoroquinolonic acid CRS in a mixture of 0.05 ml 6 mol/L ammonia solution and a quantity of water in a 50 ml flask, dilute to volume with water and mix well dilute an accurately measured quantity with water to produce a solution of 0.03 mg per ml (solution 2). The mixture of the above two solutions each of 1 ml is used to be solution (3). Carry out the method for thin layer chromatography (Appendix V B) using silica gel GF₂₅₄ as the coating substance and a mixture of methylene chloride-methanol-concentrated ammonia-acetonitrile (4 : 4 : 2 : 1) as mobile phase. Apply separately to the plate 5 µl each of three solutions and expose the plate to the ammonia vapour for 15 minutes. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). Two spots in the chromatogram must be separated on the plate with solution (3), any spot corresponding to fluoroquinolonic acid in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%).

Related substances Dissolve a quantity of the substance being examined in mobile phase to produce solutions of about 0.5 mg per ml (solution 1) and 1 µg per ml (solution 2). Carry out the method as described under the Assay. Inject 50 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of the full scale of the chart. Inject separately 50 µl of above two solutions, and record the chromatogram for twice the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) are not greater than twice and 3.5 times the area of the principal peak in the chromatogram obtained with solution (2) respectively. Disregard any peak with an area less than 0.05 times the area of principal peak in the chromatogram obtained with solution (2).

Toluene and ethanol Carry out the method for determination of residual solvents (Appendix VIII P), using a capillary column coated with 5% phenyl-95% methylpolysiloxane (or with the similar polarity stationary phase). Maintaining the temperature of the column at 50°C, use flame ionization detector (FID) with temperature at 200°C, the injector temperature is 150°C, use nitrogen as the carrier gas, the incubation temperature of headspace oven is 90°C, the incubation time of headspace vial is 30 min. Dissolve 0.2 g, accurately weighed, in headspace vial, in 5 ml of water, accurately measured, well closed, as the test solution. Measure accurately a quantity of toluene and ethanol, and dilute with water to produce a solution containing 0.05 mg of toluene and 0.1 mg of ethanol per ml. Measure accurately 5 ml into headspace vial, well closed, as the reference solution. Inject the reference solution, the resolution factor among the all-principal peaks complies with the related requirements. Inject the test solution and the reference solution separately, record the chromatogram. Calculate the content of toluene and ethanol respectively with respect to the peak area obtained in the chromatogram by the external standard method, the result complies with the related requirements.

Water 4.7%-6.7% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition : not more than 0.002%.

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L citric acid solution-acetonitrile (82 : 18) as the mobile phase previously adjusted to pH 3.5 with triethylamine. The flow rate of the mobile phase is 1 ml per minute, detection wavelength is 277 nm and the column temperature is maintained at 30°C. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of ciprofloxacin. The resolution factor between the peaks of ciprofloxacin and the neighbour impurity complies with the related requirements.

Procedure Dissolve an accurately weighed quantity in mobile phase to produce a solution of about 0.5 mg per ml. Inject 10 µl of the solution into the column. Repeat the operation, using ciprofloxacin CRS instead of the substance being examined, calculate the content of C₁₇H₁₈FN₃O₃ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Carbostyryl antibiotic

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ciprofloxacin Hydrochloride Capsules
(2) Ciprofloxacin Hydrochloride Eye Drops
(3) Ciprofloxacin Hydrochloride Tablets

Ciprofloxacin Hydrochloride Capsules

Ciprofloxacin Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of ciprofloxacin (C₁₇H₁₈FN₃O₃).

Description Capsules containing white to almost white granules or powder.

Identification (1) To a quantity of the contents of the capsules equivalent to about 0.1 g of ciprofloxacin add 20 ml of water, shake for 5 minutes to dissolve ciprofloxacin, filter, using the successive filtrate as a test solution. Dissolve a quantity of ciprofloxacin hydrochloride CRS in water to produce a reference solution of 5 mg of ciprofloxacin per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-methanol-concentrated ammonia solution-acetonitrile (4 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 1 µl each of the two solutions. Before developing, put the plate in ammonia for about 15 minutes. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ciprofloxacin CRS.

(3) To a quantity of the contents add water, shake and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Test (1) or (2) may be used alternative.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the

solution after exactly 30 minutes and filter. Dilute 2 ml of the successive filtrate, accurately measured, with 0.1 mol/L hydrochloric acid solution to 100 ml and mix well. Measure the absorbance of the solution at 277 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{18}FN_3O_3$ from each capsule, taking 1278 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents obtained in the test for Weight variation of contents equivalent to 25 mg of ciprofloxacin to a 50 ml volumetric flask, add a quantity of mobile phase, shake thoroughly to dissolve ciprofloxacin hydrochloride, dilute to the volume, mix well and filter. Carry out the Assay described under Ciprofloxacin Hydrochloride, using the successive filtrate.

Category As described under Ciprofloxacin Hydrochloride.

Strength calculated as Ciprofloxacin ($C_{17}H_{18}FN_3O_3$) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Ciprofloxacin Hydrochloride Eye Drops

Ciprofloxacin Hydrochloride Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of ciprofloxacin ($C_{17}H_{18}FN_3O_3$).

Description A colourless to slightly yellow, clear solution.

Identification (1) Dissolve separately a quantity of the substance being examined and ciprofloxacin CRS in water to produce two solutions of about 3 mg of ciprofloxacin per ml as a test solution and a reference solution respectively. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-methanol-concentrated ammonia solution-acetonitrile (4 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 1 μ l each of the two solutions. Before developing, put the plate in ammoniac for about 15 minutes. After developing and removal of the plate, dry it in air, examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ciprofloxacin CRS.

(3) Yield the reactions characteristic of chlorides (Appendix III).

pH value 4.0-5.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Measure accurately 4 ml equivalent to about 12 mg of ciprofloxacin, to a 25 ml volumetric flask, dilute with mobile phase to volume, mix well. Carry out the Assay described under Ciprofloxacin Hydrochloride, using the resulting solution.

Category As described under Ciprofloxacin Hydrochloride.

Strength calculated as ciprofloxacin ($C_{17}H_{18}FN_3O_3$) (1) 5 ml : 15 mg (2) 8 ml : 24 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Ciprofloxacin Hydrochloride Tablets

Ciprofloxacin Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of ciprofloxacin ($C_{17}H_{18}FN_3O_3$).

Description White or almost white tablets or film coated tablets with white to slightly yellow core.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.1 g of ciprofloxacin add 20 ml of water, shake thoroughly for 5 minutes to dissolve ciprofloxacin, filter, using the successive filtrate as the test solution. Dissolve a quantity of ciprofloxacin hydrochloride CRS in water to produce a reference solution of 5 mg of ciprofloxacin per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-methanol-concentrated ammonia solution-acetonitrile (4 : 4 : 2 : 1) as the mobile phase. Apply separately to the plate 1 μ l each of the two solutions. Before developing, put the plate in ammoniac air for about 15 minutes. After developing and removal of the plate, dry it in air and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ciprofloxacin CRS.

(3) To a quantity of the powdered tablets add water, shake thoroughly and filter, the filtrate yields the reactions characteristic of chlorides (Appendix III). Test (1) or (2) may be used alternative.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute 2 ml of the successive filtrate, accurately measured, with 0.1 mol/L hydrochloric acid solution to 100 ml and mix well. Measure the absorbance of the resulting solution at 277 nm (Appendix IV A). Calculate the dissolution of $C_{17}H_{18}FN_3O_3$ from each tablet, taking 1278 as the value of A (1%, 1 cm). Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 25 mg of ciprofloxacin to a 50 ml volumetric flask, add a quantity of water, shake thoroughly to dissolve, mix well and filter. Carry out the Assay described under Ciprofloxacin Hydrochloride, using the successive filtrate.

Category As described under Ciprofloxacin Hydrochloride.

Strength calculated as ciprofloxacin ($C_{17}H_{18}FN_3O_3$) 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Ciprofloxacin Lactate and Sodium Chloride Injection

Ciprofloxacin Lactate and Sodium Chloride Injection is Ciprofloxacin in sterile Water for

Injection, sodium chloride prepared with the aid of Lactic Acid, or is a sterile solution of ciprofloxacin lactate and sodium chloride in Water. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ciprofloxacin ($C_{17}H_{18}FN_3O_3$).

Description A clear, colourless or almost colourless liquid.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of ciprofloxacin CRS.

(2) The light absorption of a solution of 5 µg per ml in hydrochloric acid solution (9→1000) exhibits a maximum at 277 nm (Appendix IV A).

(3) Measure 50 ml, heat in a water bath to dryness, to the residue add 2.5 ml of hydrochloric acid solution (9→1000), stir to dissolve the residue, filter, the filtrate yields the reaction characteristic of lactate salts (Appendix III).

(4) Yields the reactions characteristic of sodium salts and chlorides (Appendix III).

pH value 3.5-4.5 (Appendix VI H).

Absorbance The absorbance at 430 nm (Appendix IV A) is not more than 0.03.

Related substances Dissolve a quantity of the substance being examined in mobile phase to produce solutions of 0.5 mg per ml (solution 1) and 5 µg per ml (solution 2). Carry out the method described under Ciprofloxacin. Each peak area other than the principal peak is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). The sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Particular matter Complies with the test for particular matter (Appendix IX D), using one container.

Heavy metals Evaporate 20 ml of the substance being examined to dryness, carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue. not more than 0.0001%.

Chloride Measure accurately 10 ml, add 40 ml of water, 5 ml of dextrin solution (1→50), 0.1 g of calcium carbonate and 5-8 drops of fluorescein IS, mix well, titrate with silver nitrate (0.1 mol/L) VS until the colour of the opalescent solution changes from yellow green to slightly red. The volume of silver nitrate (0.1 mol/L) VS consumed is not less than 14.6 ml and not more than 16.2 ml.

Pyrogens Complies with the test for pyrogens, (Appendix XI D), using 12 mg of ciprofloxacin per kg of rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Ciprofloxacin, using a solution of 0.5 mg of ciprofloxacin per ml in mobile phase.

Category As described under Ciprofloxacin.

Strength calculated as ciprofloxacin
(1) 100 ml : 0.1 g (2) 100 ml : 0.2 g
(3) 250 ml : 0.25 g.

Storage Preserve in well closed containers, protected from light.

Cisplatin

$Cl_2H_6N_2Pt$ 300.05

[15663-27-1]

Cisplatin is (Z) -diaminedichloroplatinum. It contains not less than 99.0% of $Cl_2H_6N_2Pt$.

Description A brilliant yellow to orange-yellow crystalline powder; odourless.

Freely soluble in dimethylsulfoxide; sparingly soluble in dimethylformamide; slightly soluble in water; insoluble in ethanol.

Identification (1) To about 5 mg add 1 ml of sulfuric acid, a greyish-green colour is produced.

(2) Heat a mixture of about 5 mg and a small amount of thiourea with water, a yellow colour is produced.

(3) The absorption spectrum of a solution of about 1 mg in 1 ml of sodium chloride physiological solution exhibits a maximum at 301 nm and a minimum at 247 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cisplatin (Appendix XVI).

Clarity of solution A solution of 20 mg in 20 ml of normal saline is clear.

Acidity The solution obtained in the test for Clarity of solution, pH 5.0-7.0 (Appendix VI H).

Related substances Protect from light throughout the procedure.

Carry out the method for thin-layer chromatography (Appendix V B), using microcrystalline cellulose (activated one hour at 105°C) as the coating substance and a mixture of dimethylformamide-acetone (90 : 10) as the mobile phase. Apply separately to the plate 5 µl each of two solutions in dimethylformamide containing (1) 20 mg per ml and (2) 0.40 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, spray with stannous chloride solution [dissolve 5 g of stannous chloride in 100 ml of 1 mol/L hydrochloric acid solution, filter if necessary] and examine after one hour. The R_f values of any secondary spots in the chromatogram is not greater than the principal spot obtained with solution (1) and the secondary spots with R_f values greater than the principal spot obtained with solution (1) is not more intense in colour than the principal spot obtained with solution (2).

Chlorine content Carry out the method of oxygen flask combustion (Appendix VII C), using 30 mg, accurately weighed, of the substance being examined and 20 ml of sodium hydroxide TS as the absorbing liquid. Shake vigorously for a few minutes after the combustion is complete. Rinse the stopper and platinum wire with a small amount of water. Combine the washings with the absorbing liquid, add 1 drop of bromophenol blue IS, acidify with dilute nitric acid until the solution turns to yellow and then add 1 ml of dilute nitric acid, 20 ml of ethanol and 5 drops of ethanolic solution of 1% diphenylcarbazone. Titrate with mercuric nitrate (0.025 mol/L) VS, shake vigorously towards the end of titration and continue to titrate until the solution turns to rose red. Perform a blank determination and make any necessary correction. Each ml of mercuric nitrate (0.025 mol/L) VS is equivalent to 1.773 mg of Cl. The chlorine content is 23.0%-24.3%.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight, using about 0.1 g (Appendix VIII L).

Assay Carry out the method for Residue on ignition (Appendix VIII N), using about 0.1 g, accurately weighed, without the addition of sulfuric acid. Ignite it at 400°C to constant weight. Calculate the content of $\text{PtCl}_2 (\text{NH}_3)_2$ by multiplying the weight of residue by 1.538.

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Cisplatin for Injection

Cisplatin for Injection

Cisplatin for Injection is the sterile powder of Cisplatin. It contains not less than 90.0% and not more than 110.0% of the labelled amount of cisplatin $\text{Cl}_2\text{H}_6\text{N}_2\text{Pt}$, calculated on the basis of average weight of content.

Description A brilliant yellow to orange yellow, crystalline powder.

Identification Complies with the tests for Identification described under Cisplatin.

Acidity, Related substances, Loss on drying Complies with the requirements described under Cisplatin.

Sterility Complies with the test for sterility (Appendix XI H), using a solution of 2 mg in 1 ml of sterile sodium chloride injection.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using a solution of 1 mg in 1 ml of sterile sodium chloride injection, inject 2 ml per kg of the rabbit's weight.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cisplatin, using about 0.1 g, accurately weighed, of the contents obtained in the test for Weight variation.

Category As described under Cisplatin.

Strength (1) 10 mg (2) 20 mg (3) 30 mg

Storage Preserve in well closed containers, protected from light.

Citicoline Sodium

$\text{C}_{14}\text{H}_{25}\text{N}_4\text{NaO}_{11}\text{P}_2$ 510.31

[33818-15-4]

Citicoline sodium is cytidine-5'-diphosphocholine monosodium salt. It contains not less than 98.0% of

$\text{C}_{14}\text{H}_{25}\text{N}_4\text{NaO}_{11}\text{P}_2$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; freely soluble in water, insoluble in ethanol, acetone and chloroform.

Identification (1) To about 1 mg add 3 ml of dilute hydrochloric acid and 1 ml of bromine TS, heat on a water bath for 30 minutes, and remove the bromine with ventilation. Add 0.2 ml of 3,5-dihydroxy-methylbenzene ethanol solution (1→10) and 3 ml of ammonium ferric sulfate solution in hydrochloric acid (1→1000), and heat on a water bath for 20 minutes, a green colour is produced.

(2) The retention time of the principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of citicoline sodium (Appendix XVI).

(4) Yields the flame reaction characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve 0.5 g in 10 ml of water, pH 6.0-7.5 (Appendix VI H).

Clarity and colour of solution A solution of 1.0 g in 8 ml of water is clear and colourless.

Related substances Dissolve a quantity in water to produce a solution of 2.5 mg per ml (test solution). Transfer 1 ml of the test solution measured accurately into a 100 ml volumetric flask, dilute with water to volume and mix well (reference solution 1). Transfer 2 ml of the reference solution 1 measured accurately into a 10 ml volumetric flask, dilute with water to volume and mix well (reference solution 2). Dissolve a quantity of 5'-cytidylate CRS, accurately weighed, in water to produce a solution of 7.5 µg per ml (reference solution). Carry out the method as described under Assay. Inject 10 µl of reference solution 1 into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% full scale of the chart. Inject separately 10 µl each of test solution, reference solution 1, reference solution 2 and reference solution into the column. In the chromatogram obtained with the test solution, the area of the peak corresponding to 5'-cytidylate is not greater than that of the principal peak of reference solution (0.3%), the area of any single peak other than the principal peak is not greater than that of the principal peak of reference solution 2 (0.2%), and the sum of the areas of all peaks other than the principal peak are not greater than that of the principal peak of reference solution 1.

Methanol and acetone Dissolve a quantity of ethanol, accurately measured, in water to produce a solution of 75 µg per ml (internal standard solution). To an accurately weighed quantity of methanol and acetone add internal standard solution to produce a solution of 150 µg each of methanol and acetone per ml (reference solution). Dissolve 0.5 g, accurately weighed, in the internal standard solution in a 10 ml volumetric flask, dilute with the internal standard solution to volume and mix well (test solution). Carry out the method for residual solvent (Appendix VIII P, method 3), using a packed column or a capillary column with appropriate polarity. Maintain the column temperature at 130°C. The contents of methanol and acetone comply with the requirement.

Chloride Carry out the limit test for chloride (Appendix VIII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.05%).

Ammonium Carry out the limit test for ammonium (Appendix VIII K), using 0.20 g. Any colour produced is not more intense than that of a reference solution using 10.0 ml of ammonium chloride standard solution (0.05%).

Iron Carry out the limit test for iron (Appendix VIII G), using 0.20 g. Any colour produced is not more intense than that of a reference solution using 2.0 ml of iron standard solution (0.01%).

Phosphate Dissolve 0.10 g in 10 ml of water, add 1 ml of ammonium molybdate solution (Dissolve 1 g of ammonium molybdate in 40 ml of 0.5 mol/L sulphuric acid) and 0.5 ml of 1-amino-2-naphthol -4-sulfonic acid TS, react for 5 minutes. Any colour produced is not more intense than that of a reference solution using 5.0 ml of phosphorous standard solution (Transfer 0.286 g of potassium dihydrogen phosphate to 1000 ml volumetric flask, previously dried to constant weight at 105°C, dissolve in water and dilute to volume, mix well. Before use, transfer 10 ml, accurately measured, to 100 ml volumetric flask, dilute to volume with water and mix well, equivalent to 20 µg of PO₄ per ml) (0.1%).

Loss on drying When dried in vacuum over phosphorous pentoxide at 100°C for 5 hours, loses not more than 6.0% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals, using 2.0 g (Appendix VIII H, method 1); not more than 0.002%.

Arsenic Carry out the limit test for arsenic, using 2.0 g (Appendix VIII J, method 1); not more than 0.0001%.

Bacterial endotoxin Carry out the limit test for bacterial endotoxin (Appendix XI E); less than 0.6 EU per mg.

Sterility Complies with the test for sterility (for injection) (Appendix XI H).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and phosphate BS [mix equal volumes of 0.1 mol/L potassium dihydrogen phosphate and tetrabutylammonium phosphate solution (adjust pH of 0.01 mol/L tetrabutylammonium hydroxide to 4.5 with phosphorous acid)]-methanol (95 : 5) as the mobile phase. Detection wavelength is 276 nm. Dissolve a quantity of 5'-cytidylate in water to produce a solution of 0.25 mg per ml, mix well a same amount with citicoline sodium reference solution and inject 20 µl into the column. The resolution factor between peaks of citicoline sodium and 5'-cytidylate complies with related requirements.

Procedure Dissolve an accurately weighed quantity in water to produce a solution of 0.25 mg per ml. Dissolve an accurately weighed quantity of citicoline sodium CRS in water to produce a solution of 0.25 mg per ml as reference solution. Inject 10 µl of each into the column, calculate the content of C₁₄H₂₅N₄NaO₁₁P₂ by the external standard method.

Category Medicines for improving cell metabolism.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Citicoline sodium injection
(2) Citicoline sodium for injection

Citicoline Sodium for Injection

Citicoline sodium for injection is a sterile lyophilized powder. It contains not less than 90.0% and not more than 110.0% of the labelled

amount of citicoline sodium (C₁₄H₂₅N₄NaO₁₁P₂).

Description White or almost white loose pieces.

Identification A quantity complies with tests for Identification (1), (2) and (4) described under Citicoline Sodium.

Clarity and colour of solution Dissolve in 5 ml of water, the resulting solution is clear and colourless.

Acidity or alkalinity, Loss on drying and Related substances Comply with tests described under Citicoline Sodium.

Bacterial endotoxin A quantity complies with the test for Bacterial endotoxin described under Citicoline Sodium.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay To a quantity accurately add water to produce a solution of 0.25 mg per ml, carry out the method for Assay under Citicoline Sodium.

Category As described under Citicoline Sodium.

Strength 0.25 g

Storage preserve in well closed containers, protected from light.

Citicoline Sodium Injection

Citicoline sodium injection is a sterile solution of Citicoline sodium in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of citicoline sodium (C₁₄H₂₅N₄NaO₁₁P₂).

Description A clear and colourless liquid.

Identification A quantity complies with tests for Identification (1), (2) and (4) described under Citicoline Sodium.

Acidity or alkalinity pH 6.0-8.0 (Appendix VI H).

Related substances Dissolve a quantity in water to produce a solution of 2.5 mg per ml (test solution). Transfer 1 ml of the test solution measured accurately into a 100 ml volumetric flask, dilute with water to volume and mix well (reference solution 1). Transfer 5 ml of the reference solution 1 measured accurately into a 10 ml volumetric flask, dilute with water to volume and mix well (reference solution 2). Dissolve a quantity of 5'-cytidylate CRS, accurately weighed, in water to produce a solution of 7.5 µg per ml (reference solution). Carry out the method as described under Citicoline Sodium. In the chromatogram obtained with the test solution, the area of the peak corresponding to 5'-cytidylate is not greater than that of the principal peak of reference solution (0.3%), the area of any single peak other than the principal peak is not greater than that of the principal peak of reference solution 2 and the sum of the areas of all peaks other than the principal peak are not greater than that of the principal peak of reference solution 1.

Bacterial endotoxin A quantity complies with the test for Bacterial endotoxin described under Citicoline Sodium.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Carry out the method for Assay under Citicoline Sodium.

Category As described under Citicoline Sodium.

Strength 2 ml : 0.25 g

Storage Preserve in well closed containers, protected from light.

Clarithromycin

$C_{38}H_{69}NO_{13}$ 747.96

[81103-11-9]

Clarithromycin is 6-O-methylethrythromycin. It contains not less than 94.0% of $C_{38}H_{69}NO_{13}$, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Freely soluble in chloroform; soluble in acetone or ethyl acetate; sparingly soluble in methanol or ethanol; insoluble in water.

Specific optical rotation -89° to -95° , in a solution of 10 mg per ml in chloroform (Appendix VI E).

Identification (1) Carry out the method for high performance liquid chromatography as described under Assay. The retention time of the principal peak of the substance being examined in the chromatogram corresponds to that of Clarithromycin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clarithromycin (Appendix XVI).

Alkalinity A suspension of 2 mg per ml in a mixture of water-methanol (19 : 1), pH 7.5-10.0 (Appendix VI H).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Related substances Dissolve an accurately weighed quantity in mobile phase to produce a test solution of about 1.0 mg per ml, measure accurately 5 ml to 100 ml volumetric flask, dilute with mobile phase to volume, mix well, as a reference solution. Carry out the method as described under Assay. Inject 20 μ l of the reference solution into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 40% of full scale of the chart. Inject separately 20 μ l into the column and record the chromatograms for 4 times of the retention time of the principal peak. The area of the individual impurity peak in the chromatogram obtained with the test solution is not greater than 1/2 times (2.5%) the area of the principal peak in the chromatogram obtained with the reference solution. The sum of the area of all impurity peaks in the chromatogram obtained with the test solution is not greater than 1.2 times (6.0%) area of the principal peak in the chromatogram obtained with the reference solution.

Water Dissolve a quantity in 10% imidazole solution in anhydrous methanol, carry out the method for determination of water (Appendix VIII M, method 1 A); not more than 2.0%.

Residue on ignition Not more than 0.3% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column with octadecylsilane bonded silica gel and a mixture of phosphate buffer solution (dissolve 9.11 g potassium dihydrogen phosphate in water, and dilute with water to 1000 ml, add 2 ml of triethylamine, adjust pH to 5.5 with phosphoric acid)-acetonitrile (600 : 400) as the mobile phase. The detection wavelength is 210 nm. The flow rate is 1.0 ml/min. The column temperature is 45°C. The number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of Clarithromycin. The tailing factor is not more than 2.0. The resolution factor between peaks of Clarithromycin and the impurities complies with the related requirements.

Procedure Dissolve an accurately weighed quantity in mobile phase to produce a test solution of about 0.35 mg per ml. Inject 20 μ l into the column and record the chromatogram. Repeat the operation, using Clarithromycin CRS instead of the substance being examined, calculate the content of $C_{38}H_{69}NO_{13}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Macrolide Antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Clarithromycin Capsules
(2) Clarithromycin Granules
(3) Clarithromycin Tablets

Clarithromycin Capsules

Clarithromycin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of clarithromycin ($C_{38}H_{69}NO_{13}$).

Description Capsules containing white or almost white granules or crystalline powder.

Identification The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of Clarithromycin CRS.

Related substances Dissolve a quantity of the contents of the capsules equivalent to 1.0 mg of Clarithromycin in 1 ml of mobile phase, centrifuge (3000 rpm) 5 minutes, use the supernatant fluid as a test solution, and carry out the Related Substances described under Clarithromycin. The area of the individual impurity peak in the chromatogram obtained with the test solution is not greater than 7/10 times the area of the principal peak in the chromatogram obtained with the reference solution (3.5%).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 0.1 mol/L acetate buffer solution (pH 5.0) (0.1 mol/L sodium acetate solution, adjust pH to 5.0 with glacial acetic acid) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter, dilute the successive filtrate with 0.1 mol/L acetate buffer solution to produce a solution containing 0.15 mg of Clarithromycin per ml as a test solution. Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about the average weight of one capsule in methanol (using 1 ml of methanol for 1 mg of clarithromycin), and dilute with 0.1

mol/L acetate buffer solution to produce a solution of 0.15 mg (for strength 125 mg) of clarithromycin per ml and filter as a reference solution. Measure accurately 4 ml each of the two solutions separately to two 25 ml volume flasks, add 8 ml of 0.1 mol/L acetate buffer solution, mix well, then add 10 ml of sulfuric acid solution (75→100), mix well, allow it to stand for 30 minutes, cool, dilute with 0.1 mol/L acetate buffer solution to volume, mix well. Measure the absorbance of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{38}H_{69}NO_{13}$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E)

Assay Weigh accurately a quantity of the mixed contents obtained in the test for weight variation of contents equivalent to about 35 mg of Clarithromycin to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well and filter, use the successive filtrate as a test solution, and carry out the Assay described under Clarithromycin.

Category As described under Clarithromycin.

Strength Calculated as $C_{38}H_{69}NO_{13}$
(1) 0.125 g (2) 0.25 g

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Clarithromycin Granules

Clarithromycin Granules contain not less than 90.0% and more than 110.0% of the labeled amount of clarithromycin ($C_{38}H_{69}NO_{13}$).

Description suspension granules; aromatic, taste sweet.

Identification A quantity of powdered granules complies with test (1) for Identification described under Clarithromycin.

Alkalinity A suspension of 2 mg per ml of water, pH 8.0-10.0 (Appendix VI C).

Water Dissolve about 0.2 g in 10% imidazole solution in anhydrous methanol, carry out the method for determination of water (Appendix VIII M, method 1 A); not more than 2.0%.

Other requirement Comply with the general requirement for granules (Appendix I N).

Assay Weigh accurately a quantity of the contents obtained in the test for weight variation of contents, triturate, equivalent to about 0.35 mg of Clarithromycin to a 1 ml volumetric flask, dilute with the mobile phase to volume and mix well and filter, use the successive filtrate as a test solution, and carry out the Assay described under Clarithromycin.

Category As described under Clarithromycin.

Strength Calculated as $C_{38}H_{69}NO_{13}$
(1) 0.05 g (2) 0.1 g (3) 0.125 g
4 . 2 g

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Clarithromycin Tablets

Clarithromycin Tablets contain not less than 90.0% and not more than 110.0% of the labelled

amount of clarithromycin ($C_{38}H_{69}NO_{13}$).

Description White or almost white tablets, or sugar coated, or film coated tablets with white or almost white core.

Identification A quality of powdered tablets comply with test (1) for Identification described under Clarithromycin.

Related Substances Dissolve a quantity of powdered tablets equivalent to 1.0 mg of Clarithromycin in 1 ml of mobile phase, centrifuge (3000 rpm) 5 minutes, use the supernatant fluid as a test solution, and carry out the Related Substances described under Clarithromycin. The area of the individual impurity peak in the chromatogram obtained with the test solution is not greater than 7/10 times the area of the principal peak in the chromatogram obtained with the reference solution (3.5%).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using acetate buffer solution (pH5.0) (0.1 mol/L sodium acetate solution, adjust pH to 5.0 with glacial acetic acid) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter, dilute the successive filtrate with 0.1 mol/L acetate buffer solution to produce a solution containing 0.15 mg of Clarithromycin per ml as a test solution. Triturate 10 tablets dissolve an accurately weighed quantity equivalent to about the average weight of one tablet in methanol (using 1 ml of methanol for 1 mg of clarithromycin), dilute with 0.1 mol/L acetate buffer solution to produce a solution containing 0.15 mg of clarithromycin per ml as a reference solution. Measure accurately 4 ml each of the two solutions separately to two 25 ml volume flasks, add accurately 8 ml of 0.1 mol/L acetate buffer solution, mix well, then add 10 ml of sulfuric acid solution (75→100), mix well, allow to stand for 30 minutes, cool, dilute with 0.1 mol/L acetate buffer solution to volume, mix well. Measure the absorbance of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{38}H_{69}NO_{13}$ from each tablet. Not less than 80% of the labeled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and triturate 10 tablets, weighed accurately a quantity equivalent to about 35 mg of clarithromycin to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well and filter, use the successive filtrate as a test solution, and carry out the Assay described under Clarithromycin.

Category As described under Clarithromycin.

Strength Calculated as $C_{38}H_{69}NO_{13}$
(1) 50 mg (2) 0.125 g (3) 0.25 g

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Clavulanate Potassium

$C_8H_8KNO_5$ 237.25

[61177-45-5]

Clavulanate Potassium is Potassium (Z)-(2R,5R)-3-(2-hydroxyethylidene)-7-oxo-4-oxo-1-azabi-

cyclo [3.2.0] heptane-2-carboxylate. It contains not less than 75.5% of clavulanic acid ($C_8H_9NO_5$), calculated on the anhydrous basis.

Description A white to slightly yellow crystalline powder; odour, faint; hygroscopic easily. Very soluble in water; freely soluble in methanol; slightly soluble in ethanol and insoluble in ether.

Specific optical rotation $+55^\circ$ to $+60^\circ$, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak of clavulanic acid in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of clavulanic acid CRS in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of clavulanic acid (Appendix XVI).

(3) Yields the reaction characteristic of potassium salts (Appendix III).

Acidity or alkalinity To 200 mg add 20 ml of water, pH 6.0-8.0. (Appendix VI H).

Related substances Dissolve an accurately weighed quantity of the substance being examined in mobile phase A to produce a solution of 8 mg of clavulanic acid per ml as the test solution; measure accurately a quantity of the above solution and dilute with mobile phase A to produce a solution of 0.08 mg clavulanic acid per ml as the reference solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel. 0.05 mol/L sodium dihydrogen phosphate solution (adjust the pH with phosphonic acid to 4.0) as mobile phase A; the mobile phase B is 0.05 mol/L sodium dihydrogen phosphate solution (adjust the pH with phosphoric acid to 4.0)-methanol (50 : 50). The flow rate is 1.0 ml per min and elute linear gradient, the column temperature is 40°C , detection wavelength is 230 nm. Inject $20\ \mu\text{l}$ of the system suitability solution (dissolve in mobile phase A to produce a solution of 0.1 mg amoxicillin and 0.1 mg clavulanic acid per ml separately) and record the chromatography. The relative retention time of clavulanic acid is about 1.0 and the relative retention time of amoxicillin is about 2.5. The resolution factor between the peaks of amoxicillin and clavulanic acid is not less than 13. Inject $20\ \mu\text{l}$ of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Immediately inject separately $20\ \mu\text{l}$ each of the test solution and the reference solution and record the chromatogram. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1 percent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with the reference solution (2 percent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with the reference solution.

Time(min)	Mobile phase A(%)	Mobile phase B(%)
0	100	0
4	100	0
15	50	50
18	50	50
24	100	0
39	100	0

Water Not more than 1.5% (Appendix VIII M, method 1 A).

Heavy metals Dissolved 0.2 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1), not more than 0.002%.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving each portion in not less than 500 ml of 0.9% sterile sodium chloride solution (used for injection).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): not more than 0.03 EU per mg of clavulanic acid.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate buffer solution (dissolve 7.8 g of sodium dihydrogen phosphate in 900 ml of water, adjust the pH value to 4.4 with dilute phosphoric acid or 10 mol/L sodium hydroxide solution, dilute with water to 1000 ml)-methanol (95 : 5) as the mobile phase. The flow rate is 1.0 ml per min. Detection wavelength is 220 nm. Dissolve an accurately weighed quantity of amoxicillin CRS and clavulanic acid CRS in water to produce a mixture solution of 0.45 mg of amoxicillin and 0.25 mg of clavulanic acid per ml. Inject $20\ \mu\text{l}$ of the solution into the column and record the chromatogram. The resolution factor between the peaks of amoxicillin and clavulanic acid is not less than 3.5.

Procedure Dissolve about 25 mg, accurately weighed, in water in a 100 ml volumetric flask and dilute to volume, mix well, immediately inject $20\ \mu\text{l}$ of the resulting solution into the column and record the chromatogram. Dissolve an accurately weighed quantity of clavulanic acid CRS, equivalent to about 25 mg clavulanic acid in water in a 100 ml volumetric flask and dilute to volume, mix well. Repeat the operation, calculate the content of $C_8H_9NO_5$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactamase inhibitor

Storage Preserve in hermetically sealed containers, stored in a dry place below -20°C .

Preparation (1) Amoxicillin Sodium and Clavulanate Potassium for Injection
(2) Amoxicillin Sodium and Clavulanate Potassium Tablets

Clemastine Fumarate

$C_{21}H_{26}ClNO \cdot C_4H_4O_4$ 459.97

[14976-57-9]

Clemastine Fumarate is (+)-2-[(2R)-2-[2-[(R)-p-chloro- α -methyl- α -phenylbenzyl]-oxy]ethyl]-1-methylpyrrolidine fumarate. It contains not less than 98.0% and not more than 102.0% of $C_{21}H_{26}ClNO \cdot C_4H_4O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter. Slightly soluble in methanol; very slightly soluble in water or chloroform.

Specific optical rotation $+15^{\circ}$ to $+18^{\circ}$, in a solution of about 10 mg per ml in methanol (Appendix VI E).

Identification (1) Dissolve a quantity in warm ethanol solution (8→10) to produce a solution containing about 20 mg of clemastine fumarate per ml as test solution. Prepare reference solution of about 5 mg per ml of clemastine fumarate CRS. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of isopropyl ether-formic acid-water (70 : 25 : 5) as the mobile phase. Apply separately to the same plate 5 μ l each of above two solutions, after developing and removal of the plate, dry it in air and heat at 100°C for 30 minutes, allow to cool and examine under ultraviolet light (254 nm). The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2). The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clemastine fumarate (Appendix XVI).

Clarity and colour of methanol solution A solution of 100 mg in 10.0 ml of methanol is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension [mix 2.5 ml of 0.00002 mol/L sodium chloride solution, 2.5 ml of water, 5.0 ml of 2.5 mol/L nitric acid solution and 1.0 ml of 0.1 mol/L silver nitrate solution, and use the solution within 5 minutes]; any colour produced is not more intense than that of reference solution [mix 1 volume of the solution of ferric chloride standard solution-cupric sulfate standard solution-cobaltic chloride standard solution-water (6 : 1 : 1 : 42) with 3 volumes of water].

Acidity To 1.0 g add 10 ml of water to produce a suspension; pH 3.2-4.2 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.002%.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (90 : 10 : 1) as the mobile phase. Apply separately to the plate 5 μ l of each of the following solutions in chloroform-methanol (1 : 1) containing (1) 20 mg per ml of the substance being examined, (2) 0.10 mg per ml, (3) 0.06 mg per ml and (4) 0.02 mg per ml; solution (2), (3) and (4) are prepared by diluting solution (1). After developing and removal of the plate, dry it in air, spray with dilute potassium iodobismuthate TS and hydrogen peroxide TS. The sum of any secondary spots obtained with solution (1) is not more than 1.0%; any spot, other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Assay Dissolve about 0.35 g, accurately weighed, in 60 ml of glacial acetic acid, carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 46.00 mg of $C_{21}H_{26}ClNO \cdot C_4H_4O_4$.

Category Antihistaminic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Clemastine Fumarate Tablets

Clemastine Fumarate Tablets

Clemastine Fumarate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clemastine fumarate ($C_{21}H_{26}ClNO \cdot C_4H_4O_4$).

Description White tablets.

Identification Shake a quantity of the powdered tablets equivalent to about 2.5 mg of clemastine fumarate with 10 ml of a mixture of chloroform-methanol (1 : 1) in a conical flask with stopper for 20 minutes, filter and wash the residue twice with chloroform-methanol (1 : 1), each of 5 ml, combine the filtrate and washings, evaporate to dryness in vacuum and dissolve the residue in 1 ml of a mixture of chloroform-methanol (1:1) as the test solution. Prepare the reference solution of about 2.5 mg per ml of clemastine fumarate CRS in chloroform-methanol (1 : 1). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-concentrated ammonia solution (90:10:1) as the mobile phase. Apply separately to the same plate 5 μ l each of above two solutions. After developing and removal of the plate, dry it in air, spray with dilute potassium iodobismuthate TS and hydrogen peroxide TS. The colour and position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained with the reference solution.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with 5 ml of methanol and transfer to a 50 ml volumetric flask, shake for 10 minutes to dissolve clemastine fumarate, dilute with acetic acid solution (dilute 333 ml of dilute glacial acetic acid with water to 1000 ml) to volume, shake for 20 minutes and filter. Carry out the procedure as described under Assay using the successive filtrate, calculate the content of $C_{21}H_{26}ClNO \cdot C_4H_4O_4$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 500 ml of citrate BS (pH 4.0) [dissolve 20.0 g of citric acid monohydrate in 1000 ml of water, add 22.0 ml of sodium hydroxide solution (3→10) and 8.8 ml of hydrochloric acid, dilute with water to produce 2000 ml, adjust to pH 4.0] as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 50 ml of the solution after exactly 30 minutes and use it as test solution. Weigh accurately a quantity of clemastine fumarate CRS, dilute with the dissolution medium to produce a solution with same concentration as that of the test solution, using as reference solution. Transfer the test solution and 50 ml of each of the solvent and the reference solution in separators, respectively. Add 10 ml of methyl orange solution (dilute 20 ml of methyl orange IS with water to produce 100 ml) and 20 ml of chloroform to each separator, shake for 10 minutes, allow to stand, separate the chloroform layers and filter. Measure the absorbance of the filtrates at 420 nm (Appendix IV B). Calculate the dissolution of $C_{21}H_{26}ClNO \cdot C_4H_4O_4$ from each tablet; not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay *Reference preparation* Dissolve about 27 mg of

clemastine fumarate CRS, accurately weighed, in a 100 ml volumetric flask with 10 ml of methanol, dilute with acetic acid solution (dilute 333 ml of dilute acetic acid with water to 1000 ml) to volume. Measure accurately 10 ml to a 100 ml volumetric flask, dilute with a mixture of acetic acid and methanol (dilute 100 ml of methanol with the acetic acid solution to produce 1000 ml) to volume and mix well.

Test preparation Weigh and powder 20 tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 1.35 mg of clemastine fumarate, to a 50 ml volumetric flask, add 5 ml of methanol and shake for 10 minutes until clemastine fumarate is dissolved, dilute with the above acetic acid solution to volume, shake for 30 minutes and filter, using the successive filtrate as the test solution.

Procedure Measure accurately 15 ml of each of the two solutions and the mixture of acetic acid and methanol to separators, respectively. Add 25 ml of bromocresol purple solution (dissolve 100 mg of bromocresol purple in 1000 ml of above mentioned acetic acid solution) and 50 ml of chloroform, shake for 15 minutes, allow to stand, separate the chloroform layers and filter. Measure the absorbance of the filtrates at 406 nm (Appendix IV A). Calculate the content of $C_{21}H_{26}ClNO \cdot C_4H_4O_4$.

Category As described under Clemastine Fumarate.

Strength 1.34 mg

Storage Preserve in tightly closed containers, protected from light.

Clenbuterol Hydrochloride

$C_{12}H_{18}Cl_2N_2O \cdot HCl$ 313.65

Clenbuterol Hydrochloride is 4-amino- α -(tert-butylamino) methyl]-3,5-dichlorobenzyl alcohol hydrochloride. It contains not less than 98.5% of $C_{12}H_{18}Cl_2N_2O \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, sparingly bitter. Soluble in water or ethanol; slightly soluble in chloroform or acetone; insoluble in ether.

Melting range 172-176°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 20 mg in 1 ml of water, add 5 ml of a saturated solution of potassium permanganate in 20% sulfuric acid solution. Shake for a few minutes then shake with a quantity of oxalic acid to decolorize and clarify the solution. Add 5 ml of water and a solution of dinitrophenyl hydrazine in perchloric acid, prepared by dissolving 1.2 g of 2,4-dinitrophenyl hydrazine in 50 ml of 30% perchloric acid, a precipitate is produced.

(2) The light absorption of a 30 μ g per ml solution in 0.1 mol/L hydrochloric acid solution exhibits maxima at 243 nm and 296 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is

concordant with the reference spectrum of clenbuterol hydrochloride (Appendix XVI).

(4) Yields the reaction characteristic of aromatic primary amines (Appendix III).

(5) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Total chlorine Weigh accurately about 20 mg, carry out the method for oxygen flask combustion (Appendix VII C), using 10 ml of 0.4% sodium hydroxide solution as the absorbing liquid. When the fume is absorbed completely, shake for 5 minutes, allow to stand for a few minutes. Wash the stopper and platinum wire with a quantity of water. Add 5 ml of dilute nitric acid, 15 ml of silver nitrate (0.02 mol/L) VS, measured accurately, and 3 ml of nitrobenzene, shake vigorously. Then add 2 ml of ferric ammonium sulfate IS and titrate with ammonium thiocyanate (0.02 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.02 mol/L) VS is equivalent to 0.709 mg of chlorine. It contains not less than 32.5% and not more than 35.0% of total chlorine.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.25 g, weighed accurately, in 25 ml of hydrochloric acid solution (1→2) in a 100 ml beaker, add 25 ml of water, carry out the method for potentiometric titration (Appendix VII A), titrate with sodium nitrite (0.05 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium nitrite (0.05 mol/L) VS is equivalent to 15.68 mg of $C_{12}H_{18}Cl_2N_2O \cdot HCl$.

Category β_2 -adrenergic receptor activator.

Storage Preserve in well closed containers, protected from light.

Preparation Clenbuterol Hydrochloride Suppositories

Clenbuterol Hydrochloride Suppositories

Clenbuterol Hydrochloride Suppositories contain not less than 85.0% and not more than 115.0% of the labelled amount of clenbuterol hydrochloride ($C_{12}H_{18}Cl_2N_2O \cdot HCl$).

Description White or creamy white suppositories.

Identification Melt the fatty base of five suppositories with 10 ml of water by warming on a water bath, stir, cool and filter. The filtrate complies with the tests (4) and (5) for Identification described under Clenbuterol Hydrochloride.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Weigh accurately, 20 suppositories, cut to chips. Dissolve an accurately weighed quantity equivalent to about 0.36 mg of clenbuterol hydrochloride in 20 ml of warm chloroform in a separator. Extract with 20, 15 and 10 ml of hydrochloric acid solution (9→100) successively. Combine the acid extracts in a 50 ml volumetric flask, dilute to volume with hydrochloric acid

solution (9→100), mix well. Filter and collect the successive filtrate as the test solution. Dissolve an accurately weighed quantity of clenbuterol hydrochloride CRS, in hydrochloric acid solution (9→100) to produce a solution of 7.2 µg per ml as the reference solution.

Transfer 15 ml each of the two solutions, accurately measured, to a 25 ml separator separately, add 5 ml of hydrochloric acid solution (9→100) and 1 ml of 0.1% sodium nitrite solution, mix well. Allow to stand for 3 minutes, add 1 ml of 0.5% ammonium sulfamate solution and mix well. Shake for 10 minutes, add 1 ml of 0.1% *N*-naphthylethylenediamine dihydrochloride solution and mix well. Allow to stand for 10 minutes, dilute to volume with hydrochloric acid solution (9→100) and mix well. Measure the absorbance (Appendix IV A) at 500 nm and calculate the content of $C_{12}H_{18}Cl_2N_2O \cdot HCl$.

Category As described under Clenbuterol Hydrochloride.

Strength 60 µg

Storage Preserve in tightly closed containers, protected from light and stored at a temperature below 30°C.

Clindamycin Hydrochloride

$C_{18}H_{33}ClN_2O_5S \cdot HCl$ 461.44 [21462-39-5]

Clindamycin Hydrochloride is (2*S*-trans) -methyl 7-chloro-6,7,8-trideoxy-6- [[(1-methyl-4-propyl-2-pyrrolidinyl) carbonyl] amino] -1-thio-L-threo-α-D-galactooctopyranoside monohydrochloride. It contains not less than 83.0% of $C_{18}H_{33}ClN_2O_5S$, calculated on the anhydrous basis.

Description A white crystalline powder; odourless.

Very soluble in water; freely soluble in methanol or pyridine; slightly soluble in ethanol; practically insoluble in acetone or chloroform.

Specific optical rotation +135°–+150°, in a solution of 40 mg per ml in water (Appendix VI E).

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with the principal peak in the chromatogram of clindamycin hydrochloride CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clindamycin hydrochloride (Appendix XVI). If there are some difference found in the spectrum in the region of 1680–1050 cm^{-1} , repeat the operation by dissolving a quantity of the substance being examined in the small quantity of methanol, evaporating to dryness on a water bath and drying the residue under vacuum. The infrared absorption spectrum of the residue (Appendix IV C) is concordant with the reference spectrum of clindamycin hydrochloride (Appendix XVI).

(3) The aqueous solution yields reactions characteristic of chlorides (Appendix III).

Crystallinity Complies with the requirements of the test for crystallinity (Appendix IX D).

Acidity pH 3.0–5.5 (Appendix VI H), in a solution of 100 mg per ml in water.

Related substance Carry out the method described under Assay. Dissolve a quantity of the substance being examined, accurately weighed, in the mobile phase to produce solutions of 10.0 mg per ml (solution 1) and 0.4 mg per ml (solution 2). Inject 10 µl of the solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject 10 µl of the above solutions into the column and record the chromatogram for 1.5 times the retention time of the principal peak. The sum of all secondary peak areas in the chromatogram obtained with solution (1) is not greater than twice area of the principal peak in the chromatogram obtained with solution (2) (8.0%).

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.5% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of ammonium dihydrogen phosphate solution (dissolve 2.88 g $y \quad g \quad p \quad p$ adjust to pH 3.0 with 80% phosphoric acid)-methanol (210 : 300) as the mobile phase. Detection wavelength is 214 nm and the number of theoretical plates of the column is not less than 1300, calculated with reference to the peak of clindamycin.

Procedure Dissolve about 50 mg, accurately weighed, in the mobile phase and dilute to volume in a 100 ml volumetric flask, mix well. Inject 10 µl of the solution into the column. Repeat the operation, using clindamycin hydrochloride CRS instead of the substance being examined, calculate the content of $C_{18}H_{33}ClN_2O_5S$.

Category Antibiotic.

Storage Preserve in tightly closed containers.

Preparation Clindamycin Hydrochloride Capsules

Clindamycin Hydrochloride Capsules

Clindamycin Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of clindamycin hydrochloride, calculated with reference to clindamycin ($C_{18}H_{33}ClN_2O_5S$).

Identification To a quantity of the contents equivalent to about 0.2 g of clindamycin add 10 ml of methanol and allow to stand for 20 minutes, filter, and evaporate the filtrate to dryness on a water bath. The residue complies with the tests (1) and (3) for Identification described under Clindamycin Hydrochloride.

Water Not more than 7.0% (Appendix VIII M, method 1 A), using the mixed contents.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the Assay described under Clindamycin Hydrochloride using an accurately weighed quantity (equivalent to about 50 mg of clindamycin) of the mixed contents obtained from the test for Weight variation of

contents.

Category As described under Clindamycin Hydrochloride.

Strength Calculated as $C_{18}H_{13}ClN_2O_5S$
(1) 0.075 g (2) 0.15 g

Storage Preserve in tightly closed containers.

Clioquinol

C_9H_5ClINO 305.50 [130-26-7]
Clioquinol is 5-chloro-7-iodo-8-quinolinol. It contains not less than 38.0% and not more than 42.0% of iodine (I), and contains not less than 11.0% and not more than 12.4% of chloride (Cl), calculated on the dried basis.

Description A yellowish-white to brownish-yellow loose powder; odour, characteristic; tasteless; deteriorates easily on exposure to light. Slightly soluble in boiling dehydrated ethanol; insoluble in water or ethanol; soluble in hot glacial acetic acid.

Melting range 173-179°C, with decomposition (Appendix VI C).

Identification (1) To 0.5 g, add 5 ml of sulfuric acid and heat; violet vapours are evolved, which turn the moistened starch iodide TP bluish violet.

(2) To a solution in boiling ethanol, add a drop of ferric chloride TS; a deep green colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clioquinol (Appendix XVI).

Free iodine and iodide Shake 1.0 g with 20 ml of water for 30 seconds, allow to stand for 5 minutes, and filter. To 10 ml of the successive filtrate add 1 ml of 1 mol/L sulfuric acid, then add 2 ml of chloroform, and shake; no violet colour appears in the chloroform layer (free iodine). To the mixture add 5 ml of 1 mol/L sulfuric acid and 1 ml of potassium dichromate TS, and shake for 15 seconds; the colour in the chloroform layer is not more intense than that of reference solution [dilute 2.0 ml of potassium iodide solution (1→6000) with water to 10 ml, add 6 ml of 1 mol/L sulfuric acid, 1 ml of potassium dichromate TS, and 2 ml of chloroform, and shake for 15 seconds] (0.05% of iodide).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N).

Assay Weigh accurately about 40 mg, carry out the method for oxygen flask combustion (Appendix VII C), using a mixture of 100 ml of sodium hydroxide solution (1→100) and 2 ml of saturated sulfur dioxide solution as the absorbing liquid. When the fume produced is completely absorbed, transfer to a beaker, wash the combustion flask with four 5 ml quantities of a buffer (dissolve 13.61 g of sodium acetate with 50 ml of water, and add 6 ml of glacial acetic acid, dilute with water to 100 ml, mix well). Combine the washings and the absorbing liquid in the beaker, add 25 ml

of acetone and a small quantity of polyethylene glycol 4000. Carry out the method for potentiometric titration (Appendix VII A), titrate with silver nitrate (0.1 mol/L) VS, using silver-glass electrode. The first potential jump corresponds to the consuming volume for iodine, and the second for chloride. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 12.69 mg of I, or 3.545 mg of Cl.

Category Antiamebiasis.

Storage Preserve in tightly closed containers, and protected from light.

Preparation Clioquinol cream

Clioquinol Cream

Clioquinol Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of clioquinol (C_9H_5ClINO).

Description A yellow cream.

Identification (1) To a quantity of the cream, equivalent to about 0.1 g of clioquinol, add anhydrous sodium carbonate. Heat gently until it is charred, cool, add a quantity of water and stir, filter (add a quantity of active carbon to remove the colour of the solution if it is deeply coloured). Acidify the filtrate with nitric acid and then add silver nitrate TS; a pale yellow precipitate is produced. Filter, add ammonia TS to the precipitate to make alkaline, heat to gently boiling, cool and filter. Acidify the filtrate with nitric acid; a white precipitate is produced.

(2) To a quantity of cream add methyl cellosolve, stir to dissolve, add 1 drop of ferric chloride TS; a dark green colour is produced.

Other requirements Complies with the general requirements for ointment (Appendix I F).

Assay Weigh accurately a quantity equivalent to about 20 mg of clioquinol into a beaker, add 60 ml of methyl cellosolve-water (4 : 1), warm on a water bath to dissolve clioquinol, then cool in a water bath for 30 minutes. Filter, wash the beaker and filter with methyl cellosolve-water (4 : 1), transfer the combined filtrate and washings to a 100 ml amber-coloured volumetric flask, allow to warm to room temperature and dilute to volume with methyl cellosolve-water (4 : 1), mix well as the test solution. Dissolve a quantity, accurately weighed, of clioquinol CRS in methyl cellosolve-water (4 : 1) to produce a solution of 0.2 mg per ml as the reference solution.

Transfer 10 ml of each of the two solutions, accurately measured, to two separate 25 ml volumetric flasks, add 10 ml of methyl cellosolve and 2 ml of ferric chloride TS (to 0.5 g of ferric chloride add 0.1 ml of hydrochloric acid and then dilute with methyl cellosolve to 100 ml, mix well), dilute to volume with methyl cellosolve, mix well. Measure the absorbance at 650 nm (Appendix IV A). Calculate the content of C_9H_5ClINO .

Category As described under clioquinol.

Strength 10 g : 0.3 g

Storage Preserve in tightly closed containers, stored in a cool place.

Clobetasol Propionate

$C_{25}H_{32}ClFO_5$ 466.99

[15122-46-7]

Clobetasol Propionate is 21-chloro-9 α -fluoro-11 β , 17 α -dihydroxy-16 α -methylpregna-1,4-diene-17-propionate. It contains not less than 97.0% and not more than 103.0% of $C_{25}H_{32}ClFO_5$, calculate on the dried basis.

Description An almost white to pale yellow crystalline powder.

Freely soluble in chloroform; soluble in ethyl acetate; sparingly soluble in methanol and ethanol; insoluble in water.

Melting range 190 - 197°C, with deposition (Appendix VI C).

Specific optical rotation +99° to 105°, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Identification (1) To a quantity, add 1 ml of ethanol, and mix well. Heat on water bath for 2 minutes, add 2 ml of nitric acid (1→2), mix well and add a few drops of silver nitrate, a white precipitate is produced.

(2) The infrared spectrum of clobetasol propionate (Appendix IV C) is concordant with the reference spectrum of clobetasol propionate (Appendix XVI).

(3) Yields the reaction characteristic of organic fluorides (Appendix III).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in mobile phase to produce a solution of about 0.5 mg per ml (1). Measure accurately 2 ml of solution (1) into a 100 ml volumetric flask and dilute with mobile phase to the volume, shake well as solution (2). Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 10%-20% of full scale of the chart. Then inject separately 20 μ l of solution (1) and (2) into the column, and record the chromatogram for 2.5 times the retention time of the principal peak. If there are any other peaks in the chromatogram of solution (1), the area of any one is not greater than 1/2 of area of the principal peak of solution (2), the sum of the areas of all peaks other than the principal peak is not greater than 1.25 times area of the principal peak area of solution (2).

Loss on drying When dried to constant weight as 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L sodium dihydrogen phosphate solution (adjust pH 2.5 with 85% phosphoric acid solution)-acetonitrile-methanol (425 : 475 : 100) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of clobetasol propionate. The resolution factor between the peaks of clobetasol propionate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of beclomethasone dipropionate in methanol to produce a solution of 0.40 mg per ml.

Procedure Dissolve a quantity of clobetasol propionate CRS, accurately weighed, in methanol to produce a solution of 0.20 mg per ml. Dilute 5 ml of the solution and the internal standard solution, both measured accurately, with methanol to volume in a 25 ml volumetric flask, mix well. Inject 10 μ l of the resulting solution into the column. Repeat the operation, using the substance being examined instead of clobetasol propionate CRS, calculate the content of $C_{25}H_{32}ClFO_5$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation clobetasol propionate cream

Clobetasol Propionate Cream

Clobetasol Propionate Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of clobetasol Propionate ($C_{25}H_{32}ClFO_5$).

Description A white cream.

Identification The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of clobetasol propionate CRS.

Other requirements Comply with the general requirements for ointments, Cream and Pastes (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D). Using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (65 : 35) as the mobile phase. Detection wavelength is 240 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of clobetasol propionate. The resolution factor between the peaks of clobetasol propionate and internal standard substance complies with the related requirements.

Internal standard solution To a quantity of fluocinonide, add methanol to produce a solution of 0.15 mg per ml.

Procedure Weigh accurately a quantity equivalent to about 1 mg of Clobetasol Propionate into a 50 ml volumetric flask, add accurately measured 5 ml of internal standard solution. Add 30 ml of methanol, heat in water bath at 60°C for 5 minutes, with intermittent stirring until the cream is completely dissolved and cool, dilute to volume with methanol, mix well, cool in ice-water bath more than 2 hours, filter immediately and cool to room temperature. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve an accurately weighed quantity of clobetasol propionate CRS in methanol and dilute to volume to produce a solution of 0.2 mg per ml. Measure accurately each 5 ml of this solution and 5 ml of the internal standard solution, into 50 ml volumetric flask, dilute to the volume with methanol, mix well. Inject 20 μ l into the column, record the chromatogram. Calculate the contents of $C_{25}H_{32}ClFO_5$ with respect to the peak area obtained in the chromatogram by the internal standard method.

Category As described under Clobetasol Propionate.

Strength (1) 10 g : 2 mg (2) 10 g : 5 mg

Storage Preserve in tightly closed containers, stored in a

cool place.

Clofazimine

$C_{27}H_{22}Cl_2N_4$ 473.40

[2030-63-9]

Clofazimine is 3-(4-chloroanilino)-10-(4-chlorophenyl)-2,10-dihydro-2-(isopropylimino) phenazine. It contains not less than 98.0% of $C_{27}H_{22}Cl_2N_4$, calculated on dried base.

Description A brownish-red to reddish-brown crystal or crystalline powder; odourless.

Soluble in chloroform; slightly soluble in ether; very slightly soluble in ethanol; insoluble in water.

Melting range 211-215°C, with decomposition (Appendix VI C).

Identification (1) Dissolve 10 mg in 5 ml of sulfuric acid with shaking; a purplish red colour is produced and a cherry red colour develops after diluting with water.

(2) Dissolve about 15 mg in 100 ml of chloroform and shake well, to 5 ml of the resulting solution add 10 ml of 0.1 mol/L hydrochloric acid methanolic solution and dilute to 100 ml with sufficient chloroform. The light absorption of the resulting solution exhibits two maxima at 289 nm and 491 nm.

(3) The infrared absorption spectrum (Appendix IV C), is concordant with the reference spectrum of clofazimine (Appendix XVI).

Chloride Dissolve about 0.40 g in 5 ml of glacial acetic acid and add a quantity of water and 1 ml of nitric acid, dilute to 50 ml with sufficient water, and filter if necessary. Divide the filtrate into two equal portions. To one portion add 1 ml of silver nitrate TS, allow to stand for 15 minutes. Filter, if turbid to produce a clear solution and dilute to about 40 ml, add 2 ml of sodium chloride standard solution and make up to 50 ml with sufficient water, shake well, allow to stand in dark for 5 minutes, use the resulting solution as the reference solution. To another portion add water to about 40 ml, add 1 ml of silver nitrate TS and dilute to 50 ml with water, shake well, allow to stand in dark for 5 minutes. Any opalescence produced is not more pronounced than that of the reference solution.

Related substance Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of dichloromethane-propanol (85 : 4) as the mobile phase. Apply separately to the same plate (previously saturated with 3% ammonia solution for 30 minutes) 5 µl of each of the following solutions. For solution of about 20 mg per ml of chloroform as test solution; dilute a quantity accurately measured with chloroform to solution of 0.16 mg and 0.10 mg per ml respectively as reference solution (1) and (2). After developing and removal of plate, allow it to dry in air. Develop once again, allow it to dry in air and examine under ultraviolet light (254 nm). Spray the plate with 50% sulphuric acid solution and examine again in daylight. In the

chromatogram obtained with the test solution, any secondary spot is not more intense than the principal spot in the chromatogram obtained with solution (1) and not more than two spots are more intense than the spot in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron sal. Dissolve the residue obtained in the test for Residue on ignition in 2.5 ml of dilute hydrochloric acid and 10 ml of water and filter. Wash the crucible with water in portions and mix the filtrate and the washings, dilute to 25 ml, same weight. Dilute 10 ml of the resulting solution to 35 ml with water and carry out the test for Iron (Appendix VIII G). Any colour produced is not more intense than that produced in the same manner with 2.0 ml of standard iron solution (0.005%).

Assay Dissolve about 0.3 g accurately weighed, in 25 ml of glacial acetic acid and carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank titration and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 47.34 mg of $C_{27}H_{22}Cl_2N_4$.

Category Antileprosy.

Storage Preserve in tightly closed container, store in dry place and protected from light.

Preparation Clofazimine Soft Capsules

Clofazimine Soft Capsules

Clofazimine Soft Capsules contain not less than 90.0% and not more than 110.0% of labelled amount of clofazimine ($C_{27}H_{22}Cl_2N_4$).

Description Soft capsules containing brownish red to reddish brown oily liquid.

Identification (1) Comply with the test (1) for Identification described under Clofazimine using a quantity of the contents of about 10 mg of clofazimine.

(2) Dissolve a quantity of contents in chloroform to produce a solution containing 75 µg per ml of clofazimine, shake well and filter. To a quantity of 5 ml of successive filtrate add 0.1 mol/L methanolic hydrochloric acid solution and dilute to 50 ml with chloroform, shake well. The light absorption of the resulting solution exhibits a maximum at 491 nm (Appendix IV A).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Mix the contents obtained in the test for weight variation of contents and the washings of chloroform for shell of capsules, dilute to 100 ml with chloroform and shake well. Transfer 25 ml, measured accurately, to a 50 ml beaker and carry out the method for potentiometric titration (Appendix VII A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 47.34 mg of $C_{27}H_{22}Cl_2N_4$.

Category As described under Clofazimine.

Strength 50 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Clofibrate

$C_{12}H_{15}ClO_3$ 242.70

[637-07-0]

Clofibrate is ethyl 2-(4-chlorophenoxy)-2-methylpropionate. It contains not less than 98.5% of $C_{12}H_{15}ClO_3$.

Description A clear, colourless to pale yellow, oily liquid; odour, characteristic; taste, acid then sweet; darkened gradually on exposure to light.

Freely soluble in ethanol, acetone, chloroform, ether or petroleum ether; practically insoluble in water.

Relative density 1.138-1.144 (Appendix VI A).

Refractive index 1.500-1.505 (Appendix VI F).

Identification (1) To a few drops of an ethereal solution (1→10) add a few drops of a saturated solution of hydroxylamine hydrochloride in ethanol and 2-3 drops of a saturated solution of potassium hydroxide in ethanol, heat for about 2 minutes on a water bath, and cool. Acidify with dilute hydrochloric acid, add 1-2 drops of 1% ferric chloride solution; a violet colour is produced.

(2) The light absorption of a solution of 0.10 mg per ml in dehydrated ethanol exhibits maxima at 280 nm and 288 nm; and the light absorption of a solution of 10 µg per ml in dehydrated ethanol exhibits a maximum at 226 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clofibrate (Appendix XVI).

Acidity Dissolve 2.0 g in 10 ml of neutralized ethanol (to phenolphthalein IS) add a few drops of phenolphthalein IS and 0.15 ml of sodium hydroxide (0.1 mol/L) VS; a pink colour is produced.

p-Chlorophenol Extract 10.0 g with 20 ml of sodium hydroxide TS, wash the lower layer with 5 ml of water, add the washings to the aqueous layer and reserve the organic layer for the test for volatile related substances. Extract the combined aqueous layer and washings with two quantities of 5 ml of chloroform, discard the chloroform and acidify the aqueous layer with dilute hydrochloric acid. Extract with two quantities of 5 ml of chloroform, combine the organic extracts and dilute to 10 ml with chloroform as the test preparation, 0.0025% *p*-chlorophenol solution in chloroform is used as the reference preparation. Carry out the method for gas chromatography (Appendix V E), using a glass column of 2 m long coated with 5% dimethyl silicone fluid (SE-30), maintain the column temperature at 160°C, the content of *p*-chlorophenol is not more than 0.0025%.

Volatile related substance Dry a quantity of the organic layer obtained in the test for *p*-chlorophenol with anhydrous sodium sulfate and use it as the test preparation. Carry out the method for gas chromatography (Appendix V E), under the same conditions described above. Dilute a quantity of the test preparation with chloroform to produce a solution of 10 mg per ml and inject a quantity into the column, adjust the sensitivity of the detector or the amount injected so that the system is suitable for the test, then inject a quantity of the original test preparation into the column, record the

chromatogram for twice the retention time of the principal peak. The sum of secondary peak areas is not greater than 0.5% of the total peak area.

Assay Dissolve 2 g, accurately weighed, in 10 ml of ethanol neutralized to phenolphthalein IS in a conical flask, add a few drops of phenolphthalein IS. Add sodium hydroxide (0.1 mol/L) VS dropwise until a pink colour is produced. Add 20 ml of sodium hydroxide (0.5 mol/L) VS, accurately measured, heat under reflux for 1 hour until the oil drops disappear completely, and cool. Rinse the condenser with freshly boiled and cooled water, combine the washings to the conical flask, add a few drops of phenolphthalein IS, titrate with hydrochloric acid (0.5 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalent to 121.4 mg of $C_{12}H_{15}ClO_3$.

Category Serum cholesterol and triglycerides lowering agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Clofibrate Capsules

Clofibrate Capsules

Clofibrate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of clofibrate ($C_{12}H_{15}ClO_3$).

Identification Comply with tests (1) and (2) for Identification described under Clofibrate using the contents of the capsules.

Acidity, p-Chlorophenol, Volatile related substance Comply with requirements described under Clofibrate.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the Assay described under Clofibrate, using about 2 g of the mixed contents of the capsules, accurately weighed, obtained in the test for weight variation. Each ml of sodium hydroxide (0.5 mol/L) VS is equivalents to 121.4 mg of $C_{12}H_{15}ClO_3$.

Category As described under Clofibrate.

Strength (1) 0.25 g (2) 0.5 g

Storage Preserve in tightly closed containers, protected from light.

Clomifene Citrate

$C_{26}H_{28}ClNO \cdot C_6H_8O_7$ 598.09

[50-41-9]

Clomifene Citrate is a mixture of the *E*- and *Z*-isomers of 2-[4-(2-chloro-1,2-diphenylethenyl)-phenoxy]-*N*, *N*-diethylethanamine citrate. It contains not less than 97.0% of $C_{26}H_{28}ClNO \cdot$

$C_6H_8O_7$, calculated on the anhydrous basis.

Description A white or almost white powder; odourless. Sparingly soluble in ethanol; slightly soluble in water and chloroform; practically insoluble in ether.

Identification (1) The light absorption of a 25 μ g per ml solution in hydrochloric solution (9 \rightarrow 1000) exhibits maxima at 233 nm and 290 nm; the absorbance is about 0.76-0.82 and 0.42-0.46, respectively (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clomifene citrate (Appendix XVI).

(3) Yields the reactions characteristic of citrates (Appendix III).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using silica gel as the coating substance and a mixture of *n*-hexane-chloroform-triethylamine (80 : 20 : 0.1) as the mobile phase. The amount of triethylamine may be varied to meet system suitability requirements. Detection wavelength is 302 nm. Number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of *Z*-clomifene; the resolution factor between the peaks of *E*- and *Z*-clomifene is not less than 1.3. Dissolve a quantity of the substance being examined in the mobile phase to produce a solution of 0.1 mg per ml, inject 20 μ l into the column. In the chromatogram obtained, a peak due to *E*-clomifene precedes the peak due to *Z*-clomifene. Measure the peak areas of *E*- and *Z*-clomifene, the percentage of *Z*-clomifene is 30%-50%, calculated by normalization method.

Clarity and colour of methanol solution Dissolve 1.0 g in 30 ml of methanol, the solution is clear; any colour produced is not more intense than that of reference solution Y_1 (Appendix IX A, method 1).

Water Not more than 1.0% (Appendix VIII M, method 1 A).

Heavy metals Carry out the limit test for heavy metals, using 1 g (Appendix VIII H, method 2); not more than 0.001%.

Assay Dissolve about 0.5 g, accurately weighed, in 20 ml of glacial acetic acid and add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until a bluish-green colour is produced. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 59.81 mg of $C_{26}H_{28}ClNO \cdot C_6H_8O_7$.

Category Ovulation inducer.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Clomifene Citrate Capsules
(2) Clomifene Citrate Tablets

Clomifene Citrate Capsules

Clomifene Citrate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$).

Identification (1) The light absorption of the solution obtained in the Assay exhibits maxima at 233 nm and 290 nm (Appendix IV A).

(2) The contents of the capsules yield the reactions characteristic of citrates (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Transfer an accurately weighed quantity of the mixed contents obtained in the test for weight variation equivalent to about 50 mg of clomifene citrate to a 100 ml volumetric flask. Add a quantity of hydrochloric acid solution (9 \rightarrow 1000), shake for 30 minutes to dissolve clomifene citrate, then dilute with the same solvent to volume, mix well. Filter, measure accurately 5 ml of the successive filtrate to another 100 ml volumetric flask, add hydrochloric acid solution (9 \rightarrow 1000) to volume and mix well. Dissolve a quantity of clomifene citrate CRS, accurately weighed, in hydrochloric acid solution (9 \rightarrow 1000) to produce a solution of 25 μ g per ml. Measure the absorbance of two solutions at 290 nm (Appendix IV A). Calculate the content of $C_{26}H_{28}ClNO \cdot C_6H_8O_7$.

Category As described under Clomifene Citrate.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Clomifene Citrate Tablets

Clomifene Citrate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clomifene citrate ($C_{26}H_{28}ClNO \cdot C_6H_8O_7$).

Description White tablets.

Identification (1) The light absorption of the solution obtained in the Assay exhibits maxima at 233 nm and 290 nm (Appendix IV A).

(2) It yields the reactions characteristic of citrates (Appendix III).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml hydrochloric acid solution (9 \rightarrow 1000) as the dissolution medium. Adjust the rotational speed of the basket to 100 rpm. After 45 minutes, filter a quantity of the solution, measure accurately 5 ml of the successive filtrate to a 10 ml volumetric flask, dilute with above acid solution to volume, mix well, using it as the test solution. Prepare the reference solution of clomifene citrate with a quantity of clomifene citrate CRS as described in the Assay. Measure the absorbances and calculate the dissolution of $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ from each tablet, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix III).

Assay Weigh and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to 50 mg of clomifene citrate, carry out the Assay as described under Clomifene Citrate Capsules, beginning at the words "to a 100 ml volumetric flask...", calculate the content of $C_{26}H_{28}ClNO \cdot C_6H_8O_7$.

Category As described under Clomifene Citrate.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light.

Clomipramine Hydrochloride

$C_{19}H_{23}ClN_2 \cdot HCl$ 351.32

[17321-77-6]

Clomipramine Hydrochloride is *N*, *N*-dimethyl-10,11-dihydro-3-chloro-5*H*-dibenz[*b,f*]azepine-5-propanamine hydrochloride. It contains not less than 98.5% of $C_{19}H_{23}ClN_2 \cdot HCl$, calculated on the dried basis.

Description A white to pale yellow crystalline powder; odourless; taste, bitter; gradually changes to yellow on exposure to light.

Very soluble in glacial acetic acid or chloroform; freely soluble in water or ethanol; slightly soluble in acetone; practically insoluble in ether.

Melting range 190-196°C (Appendix VI C), melting range is not more than 2°C.

Specific absorbance Measure the absorbance of a solution of 20 µg per ml in hydrochloric acid (9→1000) at 252 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 220-233.

Identification (1) To about 10 mg, add dropwise a small quantity of nitric acid, a dark blue colour is produced.

(2) Dissolve 1 g in 10 ml of water in a separator, add 5 ml of sodium hydroxide TS, extract twice with ether, each of 30 ml, combine the extracts, add a quantity of anhydrous sodium sulfate, shake and filter, expel the ether. To about 50 mg of the residue add 0.2 g of sodium carbonate, mix well. Ignite until it is completely carbonized, cool. Add 5 ml of water, boil, cool and filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clomipramine hydrochloride (Appendix XVI).

(4) The aqueous solution extracted by ether obtained in test (2) yields the reactions characteristic of chlorides (Appendix III).

Colour of solution A solution of 1.0 g in 10 ml of water is colourless; any colour produced is not more intense than that of reference solution *Y*₃ (Appendix IX A, method 1).

Acidity An aqueous solution of 2.0 g in 20 ml, pH 3.5-5.0 (Appendix VI H).

Related substances Protect from light in the operation. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G (containing CMC) as the coating substance and a mixture of glacial acetic acid-ethyl acetate-hydrochloric acid-water (35 : 55 : 5 : 5) as the mobile phase. Apply separately to the plate 5 µl each of three solutions in methanol containing (1) 20 mg; (2) 40 µg of the substance being examined per ml and (3) 0.2 mg of imipramine hydrochloride CRS per ml. Place the plate into the chromatographic chamber which is saturated by the vapour of the mobile phase (line the inner walls of the chamber with filter paper moistened by the mobile phase), after developing and removal of the plate, dry it in air, spray with a solution of 0.5% potassium dichromate in

sulfuric acid solution (20% v/v) and examine immediately. Any spot in the chromatogram obtained with solution (1) corresponds to the principal spot obtained with solution (3) is not more intense than the principal spot of solution (3) and any other secondary spot is not more intense than the principal spot obtained with solution (2). The sum of secondary spots is not more than 3.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.4 g, accurately weighed, in 30 ml of glacial acetic acid and 5 ml of mercuric acetate TS, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 35.13 mg of $C_{19}H_{23}ClN_2 \cdot HCl$.

Category Antidepressant.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Clomipramine Hydrochloride Injection
(2) Clomipramine Hydrochloride Tablets

Clomipramine Hydrochloride Injection

Clomipramine Hydrochloride Injection is a sterile solution of Clomipramine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of clomipramine hydrochloride ($C_{19}H_{23}ClN_2 \cdot HCl$).

Description A clear, colourless or almost colourless liquid.

Identification (1) To a quantity of the injection add nitric acid, a deep blue colour is produced immediately.

(2) Protect from light throughout the procedure. Dilute a quantity of the injection with methanol to produce a solution of 2.5 mg per ml as the test solution. Prepare a reference solution of 2.5 mg of clomipramine hydrochloride CRS per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of glacial acetic acid-ethyl acetate-hydrochloric acid-water (35 : 55 : 5 : 5) as the mobile phase. Apply separately to the plate 5 µl each of above two solutions, after developing and removal of the plate, dry it in air, spray with a solution of 0.5% potassium dichromate in 20% sulfuric acid solution and examine immediately. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(3) The retention time of principal peak of the clomipramine hydrochloride in the injection being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of clomipramine hydrochloride CRS in the chromatogram of the reference solution.

pH 3.5-5.0 (Appendix VI H).

Colour The absorbance at 420 nm (Appendix IV A) is not more than 0.025.

Related substances Protect from light throughout the

procedure. Carry out the method as described under Assay. Dilute a quantity of the injection with the mobile phase to produce a solution of 1 mg per ml as the test solution. Dilute a quantity of the test solution with the mobile phase to produce a solution of 0.04 mg per ml as the reference solution. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. And then inject separately 20 μ l each of the test solution and the reference solution into the column, record the chromatogram for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all peaks other than the principal peak is not greater than 3/10 of area of the principal peak in the chromatogram obtained with the reference solution (Disregard any peak with a relative retention time to clomipramine hydrochloride less than 0.25).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Protect from light throughout the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 1.25% sodium heptanesulfonate solution-1.0% trichloroacetic acid solution-2.5% potassium dihydrogen phosphate solution-methanol (80 : 50 : 40 : 330) as the mobile phase. The temperature of the column is 40°C and detection wavelength is 251 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of clomipramine. The resolution factor between the peak of clomipramine and the adjacent impurity peaks complies with the related requirements.

Procedure Dilute a quantity of the injection, accurately measured, with the mobile phase to produce a solution of 0.1 mg per ml. Inject 20 μ l of the resulting solution into the column. Repeat the operation, using clomipramine hydrochloride CRS instead of the injection being examined. Calculate the content of $C_{19}H_{23}ClN_2 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Clomipramine Hydrochloride.

Strength 2 ml : 25 mg

Storage Preserve in well closed containers, protected from light.

Clomipramine Hydrochloride Tablets

Clomipramine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clomipramine hydrochloride ($C_{19}H_{23}ClN_2 \cdot HCl$).

Description Sugar coated tablets with white to pale yellow core.

Identification (1) Comply with the tests (1), (2) and (4) for Identification described under Clomipramine Hydrochloride, using a quantity of powdered tablets. (2) The light absorption of the solution obtained in Assay exhibits a maximum at 252 nm and a shoulder peak between 270-280 nm (Appendix IV A).

Content uniformity Comply with the requirements (Appendix X E). Shake 1 tablet with 40 ml of 0.1 mol/L hydrochloric acid solution in a 50 ml volumetric flask for 1 hour, dilute to volume, mix well and filter. Proceed as

described under Assay, beginning at the words "Measure accurately a quantity of successive filtrate...". Calculate the content of $C_{19}H_{23}ClN_2 \cdot HCl$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Triturate 20 tablets with a small quantity of 0.1 mol/L hydrochloric acid solution. Transfer to a 250 ml volumetric flask with 0.1 mol/L hydrochloric acid solution in portions, shake thoroughly to dissolve clomipramine hydrochloride, dilute to volume and mix well, filter. Measure accurately a quantity of the successive filtrate, dilute with 0.1 mol/L hydrochloric acid solution to produce a solution of 20 μ g per ml, mix well. Measure the absorbance at 252 nm (Appendix IV A), calculate the content of $C_{19}H_{23}ClN_2 \cdot HCl$, taking 226 as the value of A (1%, 1cm).

Category As described under Clomipramine Hydro-chloride.

Strength (1) 10 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Clonazepam

$C_{15}H_{10}ClN_3O_3$ 315.72

[1622-61-3]

Clonazepam is 5-(O-chlorophenyl)-1,3-dihydro-7-nitro-2H-1,4-benzodiazepin-2-one. It contains not less than 99.0% of $C_{15}H_{10}ClN_3O_3$, calculated on the dried basis.

Description A slightly yellow or pale yellow crystalline powder; almost odourless; tasteless. Sparingly soluble in acetone or chloroform; slightly soluble in methanol or ethanol; practically insoluble in water.

Melting point 237-240°C (Appendix VI C).

Identification (1) Dissolve 10 mg in 1 ml of dilute hydrochloric acid, add potassium iodobismuthate TS dropwise, an orange red precipitate is produced immediately, which darkens on standing.

(2) The light absorption of a solution of 10 μ g per ml in ethanol containing 0.5% sulfuric acid exhibits two maxima at 252 nm and 307 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clonazepam (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-carbon tetrachloride (1 : 1) as the mobile phase. Apply separately to the plate 25 μ l each of two solutions in acetone containing (1) 20 mg per ml of the substance being examined and (2) 100 μ g per ml of 2-amino-2-chloro-5-nitrobenzophenone CRS. After developing and removal of the plate, dry it in air and spray with dilute sulfuric acid, heat at 105°C for 20-30 minutes, cool and spray in sequence with 0.1% sodium nitrite solution, 0.5% ammonium sulfamate solution and 0.1% N-naphthylenediamine dihydrochloride solution, allow

it to dry in air after each spraying. Any spot, other than the principal spot, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.25 g, accurately weighed, in 35 ml of acetic anhydride, add 2 drops of Nile blue IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellowish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.57 mg of $C_{15}H_{10}ClN_3O_3$.

Category Anxiolytic and Anticonvulsant agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Clonazepam Injection
(2) Clonazepam Tablets

Clonazepam Injection

Clonazepam Injection is a sterile solution of Clonazepam in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of clonazepam ($C_{15}H_{10}ClN_3O_3$).

Description A clear, colourless or slightly yellowish green liquid.

Identification (1) To 3 ml add 1 ml of dilute hydrochloric acid, and add potassium iodobismuthate TS dropwise, an orange red precipitate is produced immediately, which darkens on standing.

(2) The light absorption of a solution obtained in the Assay exhibits a maximum at 310 nm (Appendix IV A).

pH value 4.0-6.0 (Appendix IV H).

Colour Not more intense than that of reference solution YG₅ (Appendix IX A, method 1).

Related substances Measure accurately a quantity, equivalent to about 10 mg of clonazepam, in a separator and extract with 5 ml each of chloroform for 4 times. Combine the chloroform extracts, evaporate on a water bath to about 5 ml, dilute with chloroform to produce 10 ml and mix well (test solution). Dissolve 2-amino-2-chloro-5-nitrobenzophenone CRS in chloroform to produce a solution of 30 µg per ml (reference solution). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-carbon tetrachloride (1 : 1) as the mobile phase. Apply separately to the plate 50 µl of each of two resulting solutions. After developing and removal of the plate, dry it in air and spray with dilute sulfuric acid, heat at 105°C for 20 minutes, cool and spray in sequence with 0.1% sodium nitrite solution, 0.5% ammonium sulfamate solution and 0.1% *N*-naphthylenediamine dihydrochloride solution, allow it to dry in air after each spraying. Any spot, other than the principal spot, obtained with test solution is not more intense than the principal spot obtained with reference solution.

Other requirements Complies with the general requirements

for Injections (Appendix I B).

Assay Measure accurately a quantity, equivalent to about 10 mg of clonazepam, to produce a solution of 10 µg per ml in ethanol. Dissolve an accurately weighed quantity of clonazepam CRS in ethanol to produce a solution of 10 µg per ml. Measure the absorbances of the two solutions at 310 nm (Appendix IV A). Calculate the content of $C_{15}H_{10}ClN_3O_3$.

Category As described under Clonazepam.

Strength 1 ml : 1 mg

Storage Preserve in well closed containers, protected from light.

Clonazepam Tablets

Clonazepam Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clonazepam ($C_{15}H_{10}ClN_3O_3$).

Description White or almost white tablets.

Identification (1) To a quantity of powdered tablets, equivalent to about 10 mg of clonazepam, add 10 ml of acetone, shake to dissolve clonazepam and filter. Evaporate the filtrate on a water bath to dryness. The residue complies with the test (1) for Identification described under Clonazepam.

(2) The light absorption of solution obtained in the Assay exhibits a maximum at 307 nm (Appendix IV A).

Content uniformity Comply with the requirements (Appendix X E).

Triturate 1 tablet in a mortar with a quantity of ethanol solution containing 0.5% sulfuric acid. Transfer to a 50 ml (for strength 0.5 mg) or 200 ml (for strength 2 mg) volumetric flask with the same solvent in portions. Shake for 30 minutes to dissolve clonazepam, dilute to volume and mix well. Filter and use the successive filtrate as the test preparation. Proceed as described under Assay. Calculate the content of $C_{15}H_{10}ClN_3O_3$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotatory speed of the paddle to 100 rpm. Withdraw the solution after exactly 60 minutes and filter, taking the successive filtrate as the test solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-methanol-acetonitrile (40 : 30 : 30) as the mobile phase. Detection wavelength is 254 nm, and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of clonazepam. Inject 100 µl of the test solution, accurately measured, into the column and record the chromatogram. Dissolve a quantity of clonazepam CRS, accurately weighed in methanol to produce a solution of 2 µg per ml. Repeat the operation. Calculate the dissolution of $C_{15}H_{10}ClN_3O_3$ from each tablet with respect to the peak area obtained in the chromatogram by the external standard method, not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 80 tablets (for strength 0.5 mg) or 20 tablets (for strength 2 mg). To an accurately weighed quantity of the powder, equivalent to about 10 mg of clonazepam, in a 100 ml volumetric flask add 75 ml of ethanol solution containing 0.5% sulfuric acid, shake for 45 minutes to dissolve clonazepam, dilute with the

same solvent to the volume and mix well. Filter, measure accurately 5 ml of the successive filtrate to a 50 ml volumetric flask, and dilute to volume and mix well. Dissolve an accurately weighed quantity of clonazepam CRS in the same solvent to produce a solution of 10 µg per ml. Measure the absorbances of the resulting solutions at 307 nm (Appendix IV A). Calculate the content of $C_{15}H_{10}ClN_3O_3$.

Category As described under Clonazepam.

Strength (1) 0.5 mg (2) 2 mg

Storage Preserve in tightly closed containers, protected from light.

Clonidine Hydrochloride

$C_9H_9Cl_2N_3 \cdot HCl$ 266.56

[4205-91-8]

Clonidine Hydrochloride is 2,6-dichloro-*N*-2-imidazolidinylidene benzenamine monohydrochloride. It contains not less than 99.0% of $C_9H_9Cl_2N_3 \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odourless. Soluble in water or ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Identification (1) Dissolve 1 mg in 2 ml of water, add 1 ml of freshly prepared 5% sodium nitroprusside solution, 2 ml of sodium hydroxide TS and 1 g of sodium bicarbonate, shake thoroughly, a violet colour is produced, which darkens on standing.

(2) The light absorption of a solution of 0.30 mg per ml in 0.01 mol/L hydrochloric acid solution exhibits maxima at 272 nm and 279 nm; the absorbance is about 0.55 and 0.47, respectively (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clonidine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.0-5.0 (Appendix VI H).

Clarity of solution A solution of 0.10 g in 10 ml of water is clear.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and the filtered upper layer of a mixture of *n*-butanol-water-glacial acetic acid (4 : 5 : 1) as the mobile phase. Apply separately to the plate 3 µl each of two solutions in methanol containing (1) 10 mg per ml and (2) 50 µg per ml of the substance being examined. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS and followed with sodium nitrite solution. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense in colour than that of the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in 2 ml of acetate BS (pH

3.5) and sufficient water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 10 ml of glacial acetic acid and 3 ml of mercuric acetate TS by warming, cool, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 26.66 mg of $C_9H_9Cl_2N_3 \cdot HCl$.

Category Antihypertensive agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Clonidine Hydrochloride Eye Drops
(2) Clonidine Hydrochloride Injection
(3) Clonidine Hydrochloride Tablets

Clonidine Hydrochloride Eye Drops

Clonidine Hydrochloride Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of clonidine hydrochloride ($C_9H_9Cl_2N_3 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) To 0.5 ml add 2 ml of water and mix well, the solution complies with test (1) for Identification described under Clonidine Hydrochloride.

(2) The light absorbance of a solution of 0.30 mg per ml in hydrochloric acid solution (0.9→1000) exhibits two maxima at 272 nm and 279 nm (Appendix IV A).

pH value 5.0-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.22% sodium octanesulfonate-methanol-phosphoric acid (500 : 500 : 1, adjust the pH with 1 mol/L sodium hydroxide solution or phosphate to 3.0) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 3500, calculated with reference to the peak of clonidine hydrochloride. The tail factor of the column is not more than 1.5.

Procedure Dilute an accurately measured quantity of the eye drops with mobile phase to produce a solution of 2.5 µg per ml. Inject accurately measured 50 µl into the column. Dilute an accurately weighed quantity of clonidine hydrochloride CRS with mobile phase to produce a solution of 2.5 µg per ml. Repeat the operation, calculate the content of $C_9H_9Cl_2N_3 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Ophthalmic.

Strength 5 ml : 12.5 mg

Storage Preserve in well closed containers, protected from light.

Clonidine Hydrochloride Injection

Clonidine Hydrochloride Injection is a sterile

solution of Clonidine Hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of clonidine hydrochloride ($C_9H_9Cl_2N_3 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) Evaporate 6 ml to about 2 ml on a water bath, the remaining solution complies with test (1) for Identification described under Clonidine Hydrochloride.

(2) The light absorption of a solution containing 5 ml of the injection and 1 drop of 1 mol/L hydrochloric acid solution exhibits maxima at 272 nm and 279 nm (Appendix IV A).

pH value 4.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.22% sodium octanesulfonate-methanol-phosphoric acid (500 : 500 : 1, adjust the pH with 1 mol/L sodium hydroxide solution or phosphate to 3.0) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 3500, calculated with reference to the peak of clonidine hydrochloride. The tail factor of the peak is not more than 1.5.

Procedure Measure accurately 2 ml of the injection in 100 ml volumetric flask. Dilute with mobile phase to volume, mix well. Inject accurately measured 50 μ l into the column. Dilute an accurately weighed quantity of clonidine hydrochloride CRS with mobile phase to produce a solution of 3 μ g per ml. Repeat the operation, calculate the content of $C_9H_9Cl_2N_3 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Clonidine Hydrochloride.

Strength 1 ml : 0.15 mg

Storage Preserve in well closed containers, protected from light.

Clonidine Hydrochloride Tablets

Clonidine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clonidine hydrochloride ($C_9H_9Cl_2N_3 \cdot HCl$).

Description White tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 0.25 mg of clonidine hydrochloride, add 5 ml of water to dissolve clonidine hydrochloride. Add 1 ml of 30% sodium hydroxide solution, shake, then add 5 ml of ether and shake again. Separate the ether layer and evaporate to about 0.5 ml. Add 1 drop of the ether extract to a dry filter paper previously moistened with freshly prepared alkaline sodium nitroprusside solution (mix 0.2 g of sodium nitroprusside with 4 ml of water and 1 ml of sodium hydroxide TS), then add 1 drop of 8% sodium bicarbonate solution; a violet spot is produced.

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of clonidine hydrochloride CRS.

(3) To a quantity of powdered tablets equivalent to about 0.75 mg of clonidine hydrochloride add 30 ml of water, shake to dissolve clonidine hydrochloride. Add 5 ml of

sodium hydroxide TS, extract with 20 ml of chloroform and centrifuge. Filter the chloroform layer through anhydrous sodium sulfate and evaporate the filtrate to dryness. Dissolve the residue in 5 ml of 0.01 mol/L hydrochloric acid solution. The light absorption of the solution exhibits maxima at 272 nm and 279 nm (Appendix IV A).

Content uniformity Comply with the requirements (Appendix X E). Dissolve 1 tablet with mobile phase in a 25 ml volumetric flask, shake thoroughly for 30 minutes, dilute to volume with mobile phase, mix well and filter. proceed as described under the Assay, using the successive filtrate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.22% sodium octanesulfonate-methanol-phosphoric acid (500 : 500 : 1, adjust the pH with 1 mol/L sodium hydroxide solution or phosphate to 3.0) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 3500, calculated with reference to the peak of clonidine hydrochloride. The tailing factor of the peak is not more than 1.5.

Procedure Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powdered tablets equivalent to about 0.15 mg of clonidine hydrochloride in 50 ml volumetric flask with a quantity of the mobile phase, shake thoroughly for 30 minutes. Dilute with the mobile phase to volume, filter with 0.45 μ m pore size membrane. Inject accurately measured 50 μ l of the successive filtrate into the column. Dilute an accurately weighed quantity of clonidine hydrochloride CRS with mobile phase to produce a solution of 3 μ g per ml. Repeat the operation, calculate the content of $C_9H_9Cl_2N_3 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Clonidine Hydrochloride.

Strength 75 μ g

Storage Preserve in tightly closed containers, protected from light.

Clorprenaline Hydrochloride

$C_{11}H_{16}ClNO \cdot HCl$ 250.17

[5588-22-7]

Clorprenaline Hydrochloride is α -[[[(1-methyl-ethyl) amino] methyl] -2-chloro-benzenemethanol hydrochloride. It contains not less than 98.5% of $C_{11}H_{16}ClNO \cdot HCl$, calculated on dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Freely soluble in water or ethanol; soluble in chloroform; slightly soluble in acetone; insoluble in ether.

Melting range 165-169°C (Appendix VI C).

Identification (1) To 1 ml of 1% solution in water, add 5 ml of 20% saturated potassium permanganate solution in

sulfuric acid, shake for several minutes, add a quantity of oxalic acid, mix well, to make a clear solution, add 5 ml of water and dinitrophenylhydrazine TS; a precipitate is produced immediately.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clorprenaline hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Total chlorine Weigh accurately about 20 mg, carry out the method for oxygen flask combustion (Appendix VII C), using 10 ml of sodium hydroxide (0.1 mol/L) solution as the absorbing liquid. When the combustion is complete, shake for 5 minutes. Allow to stand for a few minutes. Wash the stopper and the platinum wire with a quantity of water, add 5 ml of dilute nitric acid, 15 ml of silver nitrate (0.02 mol/L) VS, measured accurately, 3 ml of nitrobenzene and 2 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.02 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.02 mol/L) VS is equivalent to 0.709 mg of Cl. The content of total chlorine (Cl) is not less than 27.5% and not more than 29.5%, calculated on dried basis.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.15 g, accurately weighed, in 20 ml of glacial acetic acid, warm to dissolve if necessary, add 3 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.02 mg of $C_{11}H_{16}ClNO \cdot HCl$.

Category β -Andrenergic receptor activating agent

Storage Preserve in tightly closed containers protected from light.

Preparation Clorprenaline Hydrochloride Tablets

Clorprenaline Hydrochloride Tablets

Clorprenaline Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clorprenaline hydrochloride ($C_{11}H_{16}ClNO \cdot HCl$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 50 mg clorprenaline hydrochloride, add 5 ml of water, stir and filter. The filtrate complies with the tests (1) and (3) for Identification described under clorprenaline hydrochloride.

Content uniformity Comply with the requirements (Appendix X E). To 1 tablet in a 50 ml conical flask with stopper, add 5 ml of water, shake to dissolve clorprenaline hydrochloride. Add 5 ml of acetic acid-sodium acetate BS (Dissolve 4 g of anhydrous sodium acetate in 800 ml of water, add 155 ml of glacial acetic acid and adjust to pH 2.8

with acetic acid), 20 ml of chloroform and 0.8 ml of a mixture of dimethyl yellow-solvent blue 19 IS. Titrate with 0.1% dioctyl sodium sulfosuccinate solution, shake vigorously towards the end of titration, continue the titration until the colour of chloroform layer turns from green to reddishgrey. Measure accurately 5 ml of reference solution of clorprenaline hydrochloride CRS (dissolve about 50 mg of clorprenaline hydrochloride CRS accurately weighed, in a 50 ml volumetric flask with water and dilute to volume, mix well) to a 50 ml conical flask with stopper, carry out the method as described above beginning at the words "shake to dissolve the clorprenaline hydrochloride", calculate the content of $C_{11}H_{16}ClNO \cdot HCl$, according to the two volumes consumed of 0.1% dioctyl sodium sulfosuccinate solution (ml).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer a quantity of the powdered tablets equivalent to about 20 mg of clorprenaline hydrochloride, accurately weighed, to a conical flask with stopper, add 20 ml of water, shake to dissolve clorprenaline hydrochloride. Add 15 ml of acetic acid-sodium acetate BS as described under the content uniformity, then 1 ml of a mixture of dimethyl yellow-solvent blue 19 IS and 20 ml of chloroform. Titrate with 0.45% dioctyl sodium sulfosuccinate solution, shake vigorously towards the end of titration, continue the titration until the colour of chloroform layer turns from green to reddish-grey. Weigh accurately about 20 mg of clorprenaline hydrochloride CRS, carry out the method as described above beginning at the words "to a conical flask with stopper", calculate the content of $C_{11}H_{16}ClNO \cdot HCl$, according to the two volumes consumed of 0.45% dioctyl sodium sulfosuccinate solution (ml).

Category As described under Clorprenaline Hydrochloride.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Clotrimazole

$C_{22}H_{17}ClN_2$ 344.84

[23593-75-1]

Clotrimazole is 1-[(2-chlorophenyl) diphenylmethyl]-1H-imidazole. It contains not less than 98.5% of $C_{22}H_{17}ClN_2$, calculated on the dried basis.

Description A white to faintly yellow crystalline powder; odourless; tasteless.

Freely soluble in methanol or chloroform; soluble in ethanol or acetone; practically insoluble in water.

Melting range 141-145°C (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 10 ml of acetone, add trinitrophenol TS until it precipitates completely, allow to stand and filter. The residue, after washing with water

and drying at 105°C for 1 hour, melts at about 170°C, with decomposition (Appendix VI C).

(2) Dissolve about 10 mg in 1 ml of sulfuric acid, an orange-yellow colour is produced; the colour disappears on adding 3 ml of water, and reappears on adding 3 ml of sulfuric acid.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clotrimazole (Appendix XVI).

Imidazole Prepare a solution of 100 mg per ml in chloroform as the test solution, and a solution of imidazole CRS of 0.50 mg per ml in chloroform as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of xylene-propanol-concentrated ammonia solution (180 : 20 : 1) as the mobile phase. Apply separately to the plate 5 µl each of the two solutions. After developing and removal of the plate, dry it in air and visualize in iodine vapour. Any spot other than the principal spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution (0.5%).

Diphenyl-(2-chlorophenyl)-methanol Prepare a solution of 200 mg per ml in chloroform as the test solution, and a solution of diphenyl-(2-chlorophenyl)-methanol CRS of 1.0 mg per ml in chloroform as the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of xylene-propanol-concentrated ammonia solution (180 : 20 : 1) as the mobile phase. Apply separately to the plate 10 µl each of the two solutions. After developing and removal of the plate, dry it in air, examine under an ultraviolet light (254 nm). The fluorescence of any secondary spot in the chromatogram obtained with the test solution is not more intense than that of the principal spot obtained with the reference solution (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals, using the residue obtained in the test for Residue on ignition (Appendix VIII H, method 2); not more than 0.002%.

Assay Dissolve about 0.3 g, accurately weighed, in 20 ml of glacial acetic acid and add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until a bluish-green colour is produced. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 34.48 mg of C₂₂H₁₇ClN₂.

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Preparation (1) Clotrimazole Cream
(2) Clotrimazole Oral Pellicles
(3) Clotrimazole Pellicles
(4) Clotrimazole Solution
(5) Clotrimazole Suppositories
(6) Compound Clotrimazole Cream

Clotrimazole Cream

Clotrimazole Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of clotrimazole (C₂₂H₁₇ClN₂).

Description A White Cream.

Identification (1) To a quantity of ointment equivalent to about 20 mg of clotrimazole add 10 ml of 0.5 mol/L sulfuric acid, warm on water bath and stir to dissolve clotrimazole, cool and filter. Add a few drops of trinitrophenol TS to the filtrate, a pale yellow precipitate is formed.

(2) To a quantity of ointment equivalent to about 20 mg of clotrimazole add 10 ml of dehydrated ethanol, warm on a water bath, cool, filter and evaporate the filtrate to dryness on water bath. Dissolve the residue with 1 ml of sulfuric acid, an orange-yellow colour is produced; the colour disappears on adding 3 ml of water, and reappears on adding 3 ml of sulfuric acid.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate solution (Dissolve 4.35 g dipotassium hydrogen phosphate and dilute to 1000 ml with water, shake well) - methanol (25 : 75) as the mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of the column is not less than 2500. The resolution factor between the peaks of clotrimazole and adjacent impurity should agree with the requirement.

Procedure Mix well the cream of 5 pieces. Dissolve a quantity of the cream, accurately weighed, with proper quantity of methanol into a 25 ml volumetric flask on the water bath at 50°C until clotrimazole is dissolved, cool to room temperature, dilute with methanol to the volume, shake well, put in an ice water bath for 2 hours, immediately filter, take the successive filtrate and cool to room temperature as the test solution. Inject 20 µl into the column and record the chromatogram. Dissolve a quantity of clotrimazole CRS, accurately weighed, and dilute with methanol to produce a solution of about 0.5 mg per ml, repeat the operation of the test solution, calculate the content of C₂₂H₁₇ClN₂ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Clotrimazole.

Strength (1) 1% (2) 3%

Storage Preserve in tightly closed containers, protected from light, stored at a cool and dry place.

Clotrimazole Oral Pellicles

Clotrimazole Oral Pellicles contain not less than 90.0% and not more than 110.0% of the labelled amount of clotrimazole (C₂₂H₁₇ClN₂).

Description White pellicles.

Identification (1) To a quantity of pellicles equivalent to about 20 mg of clotrimazole add 10 ml of 0.1 mol/L sulfuric acid, and filter. Add a few drops of trinitrophenol TS to the filtrate, a yellow precipitate is formed.

(2) To a quantity equivalent to about 20 mg of clotrimazole add 10 ml of acetone, warm on a water bath, cool, filter and evaporate the filtrate to dryness. Dissolve the residue with 1 ml of sulfuric acid, an orange-yellow colour is produced; the colour changes to opalescence on adding 3 ml of water and reappears on adding 3 ml of sulfuric acid.

Disintegration test Cut the pellicles to 6 pieces of one centimetre square, hold separately between two stainless steel sieve with pore 2.0 mm in diameter. Carry out the test

as described under Disintegration test for tablets (Appendix X A), the pellicles should completely melt and pass through the sieve in 15 minutes.

Other requirements Comply with the general requirements for pellicles (Appendix I M).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate solution (Dissolve 4.35 g dipotassium hydrogen phosphate and dilute to 1000 ml with water, shake well) - methanol (25 : 75) as the mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of the column is not less than 2500. The resolution factor between the peaks of clotrimazole and adjacent impurity should agree with the requirement.

Procedure Shear crush 20 sheets, accurately weighed. Dissolve proper quantities equivalent 12.5 mg clotrimazole, with proper quantity of methanol into a 25 ml volumetric flask, ultrasonic for 10 minutes until clotrimazole is dissolved, cool to room temperature, dilute with methanol to the volume, shake well and filter, take the successive filtrate as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of clotrimazole CRS, accurately weighed, and dilute with methanol to produce a solution of about 0.5 mg per ml, repeat the operation of the test solution, calculate the content of $C_{22}H_{17}ClN_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Clotrimazole.

Strength 4 mg

Storage Preserve in tightly closed containers, protected from light, stored at a cool and dry place.

Clotrimazole Pellicles

Clotrimazole Pellicles contain not less than 90.0% and not more than 110.0% of the labelled amount of clotrimazole ($C_{22}H_{17}ClN_2$).

Description, Identification, Disintegration test, Other requirements As described under Clotrimazole Oral Pellicles.

Assay Shear crush accurately weighed 2 sheets. Weigh accurately a quantity of the mass equivalent to about 50 mg of clotrimazole to a stoppered conical flask. Dissolve in 20 ml of chloroform, add 20 ml of water, 5 ml of dilute sulfuric acid and 0.4 ml of dimethyl yellow-solvent blue 19 IS, titrate with sodium dioctylsulfosuccinate TS. Shake vigorously towards the end of titration and continue to titrate until the chloroform layer changes from green to reddish-grey. Perform another titration in the same manner, using 50 mg of clotrimazole CRS, accurately weighed. Calculate the content of $C_{22}H_{17}ClN_2$.

Category As described under Clotrimazole.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light, stored at a cool and dry place.

Clotrimazole Solution

Clotrimazole Solution contains not less than 90.0%

and not more than 110.0% of the labelled amount of clotrimazole ($C_{22}H_{17}ClN_2$).

Description A clear, colourless to faintly yellow liquid.

Identification Evaporate a quantity on a water bath to dryness. To the residue add chloroform to produce a solution of 2 mg per ml (solution 1). Dissolve a quantity of clotrimazole CRS in chloroform to produce a solution of 2 mg per ml (solution 2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and isopropyl ether as the mobile phase, the chromatographic chamber is saturated with ammonia vapour. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, dry it in air, and visualize in iodine vapour. The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that obtained with solution (2).

Minimum fill Complies with the requirement (Appendix X F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphate solution (Dissolve 4.35 g dipotassium hydrogen phosphate and dilute to 1000 ml with water, shake well) - methanol (25 : 75) as the mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of the column is not less than 2500. The resolution factor between the peaks of clotrimazole and adjacent impurity should agree with the requirement.

Procedure Measure accurately 2 ml of the substance being examined into a 25 ml volumetric flask and dilute with methanol to the volume, shake well as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of clotrimazole CRS, accurately weighed, and dilute with methanol to produce a solution of about 0.6 mg per ml, repeat the operation of the test solution, calculate the content of $C_{22}H_{17}ClN_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Clotrimazole.

Strength 1.5%

Storage Preserve in well closed containers.

Clotrimazole Suppositories

Clotrimazole Suppositories contain not less than 90.0% and not more than 110.0% of the labelled amount of clotrimazole ($C_{22}H_{17}ClN_2$).

Description Creamy white to faintly yellow conical suppositories.

Identification Dissolve the fatty base of 2 suppositories in 10 ml of petroleum ether by warming on a water bath, cool, discard the petroleum ether layer. The residue, washed with two portions of petroleum ether and dried on a water bath, complies with the tests for Identification described under Clotrimazole Solution.

Other requirements Comply with the general requirements for suppositories (Appendix I D).

Assay Melt 10 suppositories, accurately weighed, in an evaporating dish by warming on a water bath, cool and stir. Weigh accurately a quantity of the mass equivalent to about 50 mg of clotrimazole to a stoppered conical flask. Dissolve in

20 ml of chloroform, add 20 ml of water, 5 ml of dilute sulfuric acid and 0.4 ml of dimethyl yellow-solvent blue 19 IS, titrate with sodium dioctylsulfosuccinate TS. Shake vigorously towards the end of titration and continue to titrate until the chloroform layer changes from green to reddish-grey. Perform another titration in the same manner, using 50 mg of clotrimazole CRS, accurately weighed. Calculate the content of $C_{22}H_{17}ClN_2$.

Category As described under Clotrimazole.

Strength 0.15 g

Storage Preserve in tightly closed containers, stored at a temperature below 30°C.

Compound Clotrimazole Cream

Compound Clotrimazole cream contains not less than 90.0% and not more than 110.0% of the labelled amount of clotrimazole ($C_{22}H_{17}ClN_2$).

Formula	Clotrimazole	15.0 g
	Urea	150 g
	Base	a quantity
	To make	1000 g

Description White to slightly yellow cream.

Identification (1) To a quantity of cream equivalent to about 20 mg of clotrimazole add 10 ml of 0.5 mol/L sulfuric acid; warm on a water bath and stir to dissolve clotrimazole; cool and filter. Add a few drops of trinitrophenol TS to 2 ml of the filtrate, a slightly yellow precipitate is formed.

(2) To 1 ml of the above mentioned filtrate add 1 ml of sulfuric acid and shake, an orange-yellow colour is produced; the colour disappears on adding 3 ml of water, and reappears on adding 3 ml of sulfuric acid.

(3) Transfer a quantity of cream equivalent to about 0.2 g of urea to a test tube and heat. The urea is decomposed to produce ammonia gas which turns a wet litmus TP from red to blue.

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Dissolve a quantity of the cream, accurately weighed, equivalent to about 50 mg of clotrimazole in 50 ml of chloroform-acetone (7 : 3) solution in a stoppered conical flask and heat to dissolve clotrimazole on a water bath. Add 5 g of anhydrous sodium sulfate, stir for 1-2 minutes, cool in a ice bath for 40 minutes, filter. Wash the residue with 10 ml each of chloroform-acetone (7 : 3) solution for three times, combine the washings to the filtrate. Expel the solvent to get an oily liquid on water bath. Add 20 ml of water, 5 ml of dilute sulfuric acid and 0.6 ml of dimethyl yellow-solvent blue 19 IS, titrate with dioctyl sodium sulfosuccinate TS, shake vigorously towards the end of titration and continue to titrate until the chloroform layer changes from green to reddish grey. Perform another titration in the same manner, using 50 mg of clotrimazole CRS, previously dried to constant weight at 105°C and calculate the content of $C_{22}H_{17}ClN_2$.

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light, stored at a cool place.

Cloxacillin Sodium

$C_{19}H_{17}ClN_3NaO_5S$ 457.87

[7081-44-9]

Cloxacillin Sodium is sodium (2*S*, 5*R*, 6*R*)-6- [3-(*o*-chlorophenyl)-5-methyl-4-isoxazolecarboxamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo [3.2.0] heptane-2-carboxylate. Monohydrate of cloxacillin sodium is used for oral administration. It contains not less than 90.0% of $C_{19}H_{18}ClN_3O_5S$, calculated on the anhydrous basis.

Description A white or crystalline powder; odour, slight; taste, bitter; hygroscopic.

Freely soluble in water; soluble in ethanol; practically insoluble in ethyl acetate.

Specific optical rotation +163° to +172°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cloxacillin sodium CRS in the chromatogram of the reference solution.

(2) Drop the solution of 30 mg in 0.1 ml of methanol on the evaporating dish. After evaporating methanol in air, dry it in vacuum for hours. The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of cloxacillin CRS treated in the same manner.

(3) Yields the flame reaction of sodium salts (Appendix III).

Acidity Dissolve 1 g in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution To 5 portions each of 0.6 g add 4.5 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of the reference suspension I (Appendix IX B); any colour produced is not more intense than that of the reference solution Y₄ or YG₄ (Appendix IX A, method 1) (for parenteral use).

Related substances Dissolve an accurately weighed quantity in the mobile phase to produce a test solution of 1 mg per ml. Dilute an accurately measured quantity with water to produce a reference solution of 0.01 mg per ml. Carry out the method described under Assay, inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject 20 µl of the test solution and the reference solution respectively, and record the chromatogram for 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1 percent), the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with the reference solution (5 percent).

Water Not more than 4.5% (Appendix VIII M, method 1 A).

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 1 ml of a solution of 25 mg per ml in sterile Water for Injection per kg of the rabbit's weight (for parenteral use).

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), dissolving a quantity in the suitable solvent and transferring the solution to not less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.02 mol/l potassium dihydrogen phosphate solution (adjust the pH with potassium hydroxide solution to 5.0) -acetonitrile (75 : 25) as the mobile phase. Detection wavelength is 225 nm. Dissolve separately a quantity of Cloxacillin CRS and Floxacillin CRS in the mobile phase to produce a reference solution of 0.1 mg per ml. Inject 20 μ l of the reference solution into the column and record the chromatogram. The resolution factor between the peaks of cloxacillin and floxacillin should be not less than 2.5. The number of the theoretical plates of the column is not less than 1000 calculated with reference to the peak of cloxacillin. The tailing factor is not more than 1.5.

procedure Dissolve an accurately weighed quantity of cloxacillin in the mobile phase to produce a solution of 0.1 mg per ml. Inject 20 μ l of the solution into the column and record the chromatogram. Repeat the operation, using cloxacillin CRS. Calculate the content of $C_{19}H_{18}ClN_3O_5S$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category β -lactam antibiotic.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation (1) Cloxacillin Sodium Capsules
(2) Cloxacillin Sodium Granules
(3) Cloxacillin Sodium for Injection

Cloxacillin Sodium Capsules

Cloxacillin Sodium Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cloxacillin ($C_{19}H_{18}ClN_3O_5S$).

Identification The contents of cloxacillin sodium capsules comply with the tests (1) and (3) for Identification described under Cloxacillin Sodium.

Water Not more than 6.0% (Appendix VIII M, method 1 A).

Dissolution Carry out the dissolution test (Appendix X C, Method 1), using 900 ml water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of 20 μ g per ml. Measure the absorbance of resulting solution at 225 nm (Appendix IV A). Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents, equivalent to about the average weight in each capsule, in water with ultrasonic treatment and dilute to produce a solution of 20 μ g per ml, calculated by the labelled amount. Repeat the operation. Calculate the dissolution of $C_{19}H_{18}ClN_3O_5S$ from each capsule. Not less than 80% is

dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E)

Assay Dissolve an accurately weighed quantity, equivalent to about 100 mg of cloxacillin, of the mixed contents in the test for weight variation of contents in mobile phase and dilute to volume in a 100 ml volumetric flask, mix well and filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute to volume with mobile phase and mix well as the test solution. Carry out the Assay described under Cloxacillin Sodium.

Category As described under Cloxacillin Sodium.

Strength Calculated as $C_{19}H_{18}ClN_3O_5S$
(1) 0.125 g (2) 0.25 g (3) 0.5 g

Storage Preserve in tightly closed containers, stored in a dry place.

Cloxacillin Sodium for Injection

Cloxacillin Sodium for Injection is a sterile powder of Cloxacillin Sodium. It contains not less than 90.0% of $C_{19}H_{18}ClN_3O_5S$, calculated on the anhydrous basis; not less than 95.0% and not more than 105.0% of the labelled amount of cloxacillin ($C_{19}H_{18}ClN_3O_5S$), calculated with reference to the average weight of contents.

Description A white or crystalline powder.

Identification Complies with the tests for Identification described under Cloxacillin Sodium.

Clarity and colour of solution Add 5 ml of water to each of 5 containers, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Water Not more than 5.0% (Appendix VIII M, method 1 A).

Related substances Carry out the Related substances described under Cloxacillin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents. In the chromatogram obtained with the test solution; the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1 percent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with the reference solution (5 percent).

Acidity, Pyrogens and sterility Comply with the corresponding tests described under Cloxacillin Sodium.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cloxacillin Sodium, using an accurately weighed quantity of the mixed contents obtained in the test for weight variation of contents.

Category As described under Cloxacillin Sodium.

Strength 0.5 g (calculated as $C_{19}H_{18}ClN_3O_5S$)

Storage Preserve in well closed containers, stored in a dry place.

Cloxacillin Sodium Granules

Cloxacillin Sodium Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of cloxacillin ($C_{19}H_{18}ClN_3O_5S$).

Description Soluble granules; odour, fragrant; taste, sweet.

Identification Comply with the tests (1) and (3) for Identification described under Cloxacillin Sodium.

Acidity and alkalinity Dissolve a quantity in water to produce a solution of 25 mg per ml, pH 5.0-7.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with requirements for granules (Appendix I N).

Assay Carry out the Assay described under Cloxacillin Sodium. Dissolve an accurately weighed quantity, equivalent to about 100 mg of cloxacillin, of the mixed contents obtained in the test for weight variation of contents in mobile phase and dilute to volume in a 100 ml volumetric flask, mix well and filter. Transfer 5 ml of the successive filtrate, accurately measured, to a 50 ml volumetric flask, dilute to volume with mobile phase and mix well as the test solution.

Category As described under Cloxacillin Sodium.

Strength 50 mg (calculated as $C_{19}H_{18}ClN_3O_5S$)

Storage Preserve in tightly closed containers, stored in a dry place.

Clozapine

$C_{18}H_{19}ClN_4$ 326.84

[5786-21-0]

Clozapine is 8-chloro-11-(4-methyl-1-piperazinyl)-5H-dibenzo[*b,e*][1,4]diazepine. It contains not less than 98.5% of $C_{18}H_{19}ClN_4$, calculated on the dried basis.

Description A pale yellow crystalline powder; odourless; tasteless.

Freely soluble in chloroform; soluble in ethanol; practically insoluble in water.

Melting range 181-185 °C (Appendix VI C).

Specific absorbance Measure the absorbances of a solution of 10 µg per ml in a mixture of 0.5 mol/L sulfuric acid solution-ethanol (1 : 99) at 242 nm and 296 nm (Appendix IV A), the values of *A* (1%, 1cm) are 710-770 and 293-320, respectively.

Identification (1) To about 100 mg add an equal amount of sodium carbonate in a dry test tube, mix well. Ignite, fumes are evolved which turn a filter paper moistened with 1% of sodium 1,2-naphthoquinone-4-sulfonate solution to

purplish-blue colour.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of clozapine (Appendix XVI).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g, accurately weighted, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bright green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 16.34 mg of $C_{18}H_{19}ClN_4$.

Category Antianxiety and anticonvulsant agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Clozapine Tablets

Clozapine Tablets

Clozapine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of clozapine ($C_{18}H_{19}ClN_4$).

Description Pale yellow tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 100 mg of clozapine, add an equal amount of sodium carbonate in a dry test tube, mix well. Ignite, fumes are evolved which turn a filter paper moistened with 1% of sodium 1,2-naphthoquinone-4-sulfonate solution to purplish-blue colour.

(2) To a quantity of powdered tablets equivalent to about 50 mg of clozapine, add 10 ml of chloroform, shake and filter, evaporate the filtrate to dryness. The infrared absorption spectrum (Appendix IV C) of the residue is concordant with the reference spectrum of clozapine (Appendix XVI).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 1000 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotatory speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 30 minutes and filter. Dilute an accurately weighed quantity of the successive filtrate with dissolution medium to produce a solution of 5 µg per ml, and mix well. Dissolve an accurately weighed quantity of clozapine CRS in dissolution medium to produce a solution of 5 µg per ml. Measure the absorbance of the resulting solution at 240 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{19}ClN_4$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 25 mg of clozapine, to a 100 ml volumetric flask. Add about 60 ml of a mixture of 0.5 mol/L sulfuric acid solution-ethanol (1 : 99), shake thoroughly to dissolve clozapine, dilute with the same solvent to volume and mix well. Filter, measure accurately 10 ml of the successive filtrate to a 250 ml volumetric flask, dilute to volume with the same solvent and mix well. Measure the absorbance of the resulting solution at 243 nm (Appendix IV A), calculate the content of $C_{18}H_{19}ClN_4$, taking 740 as the value of *A* (1%, 1 cm).

Category As described under Clozapine.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers, protected from light.

Cobamamide

$C_{72}H_{100}CoN_{18}O_{17}P$ 1579.60

[3870-90-1]

Cobamamide is 5,6-dimethylbenzimidazolyl-5'-deoxyadenosyl cobalamin. It contains not less than 95.0% of $C_{72}H_{100}CoN_{18}O_{17}P$, calculated on the dried basis.

Description Dark red crystals or a amorphous powder; hygroscopic; decomposed easily on exposure to light. Sparingly soluble in water; practically insoluble in ethanol, insoluble in acetone, ether or chloroform.

Identification Protect from light in the procedure.

(1) The light absorption of a solution of 50 µg per ml in potassium chloride solution [mix 125 ml of 0.2 mol/L potassium chloride solution with 53 ml of 0.2 mol/L hydrochloric acid solution, add water to 1000 ml] (Appendix IV A), exhibits four maxima at 264 nm, 285 nm, 305 nm and 460 nm.

(2) The light absorption of a solution of 50 µg per ml in phosphate BS (pH 7.0) (Appendix IV A), exhibits two maxima at 261 nm and 525 nm.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cobamamide (Appendix XVI).

Hydroxycobamine Protect from light in the procedure. The ratio of the absorption of the solution measured in the test (1) for Identification at 460 nm to that at 352 nm (Appendix IV A) is not less than 0.90.

Related substances Protect from light in the procedure. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed an octadecylsilane bonded silica gel and a mixture of acetonitrile-0.05 mol/L potassium dihydrogen phosphate TS (17 : 83), adjusted pH to 3.2 with 85% phosphoric acid as the mobile phase. Detection wavelength is 260 nm and the number of theoretical plates of the column is not less than 800, calculated with reference to the peak of cobamamide.

Dissolve a quantity of the substance being examined in water

to produce two solutions containing (1) 1.0 mg per ml and (2) 20 µg per ml, inject 10 µl of solution (2) into the column and adjust the attenuation of the detector so that the height of principle peak is about 20% of the full scale of the chart. Inject 10 µl each of solution (1) and (2), record the chromatogram for twice the retention time of the principle peak. The sum of the areas of the peaks other than principal peak in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C (under 0.66 kPa), loses not more than 12.0% of its weight (Appendix VIII L).

Assay Protect from light in the procedure. Dissolve an accurately weighed quantity in water to produce a solution of 500 µg per ml. Transfer 5 ml of the solution, accurately measured, to each of two 50 ml volumetric flasks, dilute with the above mentioned potassium chloride solution or the phosphate BS (pH 7.0) to volume respectively. Measure the absorbances of the resulting solutions at maximum wavelength in vicinity of 304.5 nm at an interval of 0.2 nm with dilute potassium chloride solution, using respectively above mentioned diluent solution as each blank. Calculate the content of $C_{72}H_{100}CoN_{18}O_{17}P$ by using the difference between the two of absorbances, taking 58.0 as the value of ΔA (1%, 1 cm).

Category Vitamin.

Storage Preserve in tightly closed container, protected from light.

Preparation Cobamamide Tablets

Cobamamide Tablets

Cobamamide Tablets contains not less than 90.0% and not more than 110.0% of the labelled amount of cobamamide ($C_{72}H_{100}CoN_{18}O_{17}P$).

Description Sugar coated tablets with pink cores.

Identification Protect from light in the procedure. Dissolve a quantity of finely pulverized tablets with coating removed in phosphate BS (pH 7.0) to produce a solution of 50 µg per ml, filter with membrane (0.45 µm). The filtrate complies with the test (2) for Identification described under Cobamamide.

Hydroxycobamamide Protect from light in the procedure.

Powder 10 tablets with coating removed and titurate with potassium chloride solution [mix 250 ml of 0.2 mol/L potassium chloride solution with 53 ml of 0.2 mol/L hydrochloric acid solution, add water to 1000 ml] in portions and transfer to a 50 ml volumetric flask, shake thoroughly to dissolve cobamamide and add potassium chloride solution to volume, mix well, filter with membrane (0.45 µm). Measure the absorbance of the filtrate (Appendix IV A), the ratio of the absorbance at 460 nm to that at 352 nm is not more than 0.80.

Content uniformity Protect from light in the procedure.

Carry out the test for content uniformity (Appendix X E). Shake 1 tablet with coating removed in a 10 ml volumetric flask with phosphate BS (pH 7.0) and dilute to volume with phosphate BS (pH 7.0), and dilute to volume, mix well, filter with membrane (0.45 µm). Measure the absorbance of the successive filtrate at 261 nm (Appendix IV A). The limit is not greater than 20%.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay *Reference preparation* Dissolve about 20 mg of vitamin B₁₂ CRS, accurately weighed, in a 500 ml volumetric flask with water and dilute to volume, mix well.

Test preparation Powder 100 tablets with coating removed, triturate with water for several times and transfer to a 500 ml volumetric flask, shake thoroughly, filter with membrane (0.45 µm), collect the successive filtrate.

Procedure Transfer 10 ml of each of the reference and preparations, accurately measured, to 25 ml test tube with stopper respectively, add 15 ml of 0.65% potassium cyanide solution respectively, accurately measured, tightly close stopper, mix well, exposure under two 100 W lamp at a distance of 200 mm from both sides of the tubes for 1 hr. Measure the absorbances of the resulting solutions at 368 nm (Appendix IV A). Calculated the content of cobamamide by multiplying 1.1654.

Category As described under Cobamamide.

Strength 0.25 mg

Storage Preserve in tightly closed containers, protected from light.

Cocaine Hydrochloride

C₁₇H₂₁NO₄ · HCl 339.82 [53-21-4]

Cocaine Hydrochloride is [1R-(exo, exo)]-3-(benzoyloxy)-8-methyl-8-azabicyclo[3.2.1]octane-2-carboxylic acid methylester hydrochloride. It contains not less than 98.5% of C₁₇H₂₁NO₄ · HCl, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless.

Very soluble in water; freely soluble in ethanol; soluble in chloroform; insoluble in ether.

Specific optical rotation -71° to -73°, in a solution of 20 mg per ml in water (Appendix VI E).

Identification (1) Heat about 0.1 g in a test tube with 1 ml of sulfuric acid in a water bath for 5 minutes and add carefully along the test tube wall 2 ml of water; the odour of methyl benzoate is perceptible. Benzoic acid crystallizes out gradually on cooling.

(2) To 5 ml of a water solution (1→50) add 5 drops of chromium trioxide solution (1→20), a yellow precipitate is produced which is redissolved on shaking; a persistent orangish-yellow precipitate is produced on further addition of 1 ml of hydrochloric acid.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cocaine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 10 ml of water, add 1 drop of methyl red IS. If the solution becomes pink, it changes to yellow on the addition of 0.50 ml of sodium hydroxide (0.02 mol/L) VS.

Cinnamylcocaine and other oxidizable substances Dissolve 0.10 g in 5 ml of water, add 0.3 ml of 5% sulfuric acid solution and 0.10 ml of potassium permanganate (0.02 mol/L) VS. Stopper the flask and allow to stand at 15-20°C in a dark place for 30 minutes, the purple colour is not completely discharged.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes pure blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 33.98 mg of C₁₇H₂₁NO₄ · HCl.

Category Local anesthetic agent.

Storage Preserve in tightly closed containers, protected from light.

Cod Liver Oil

Cod Liver Oil is a fatty oil obtained from the liver of non-toxic marine fish. It is processed by partial destearinating at about 0°C and adjusting the vitamin content as required by addition of refined vegetable oil, concentrated cod liver oil or vitamin A and vitamin D₃. A suitable stabilizer may be added. Cod Liver Oil contains not less than 90.0% of the labelled amount of vitamin A; not less than 85.0% of the labelled amount of vitamin D.

Description A yellow to orange-red clear liquid; odour, slight and fishy, but not rancid.

Identification (1) Dilute a quantity with chloroform to produce a solution containing 10-20 Units of Vitamin A per ml. To 1 ml of the solution add 2 ml of a solution of antimony trichloride in chloroform (1→4), a blue to bluish-violet colour is produced immediately, and disappears gradually on standing.

(2) Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-acetonitrile (3 : 97) as the mobile phase. Detection wavelength is 254 nm. Inject a mixture of equal fraction of vitamin D₂ and D₃ equivalent to 5-10 Units each into the column, adjust the composition of mobile phase to that the resolution factor is greater than 1.0. Dry the test solution B described under the Assay of Vitamin D (Appendix VII K) with a stream of oxygen free nitrogen, add a few quantity of mobile phase to dissolve the residue, and inject this solution into the column, the retention time of principal peak of the substance being examined in the chromatogram is identical with that the principal peak of vitamin D₂ or D₃ in the chromatogram of the reference solution.

Acid value Transfer 15 ml each of ethanol and ether to a conical flask, add 5 drops of phenolphthalein IS and sodium hydroxide (0.1 mol/L) VS dropwise until a pink colour is produced. Add 2.0 g of the oil and boil under a reflux condenser for 10 minutes. Cool and titrate with sodium

hydroxide (0.1 mol/L) VS. The acid value (Appendix VII H) is not greater than 2.8.

Assay Vitamin A Carry out the method for Assay of Vitamin A (Appendix VII J).

Vitamin D Carry out the method for Assay of Vitamin D (Appendix VII K).

Category Vitamin.

Strength (1) 1500 Units of vitamin A and 150 Units of vitamin D in each g.
(2) 3000 Units of vitamin A and 300 Units of vitamin D in each g.

Storage Preserve in tightly closed containers, fully filled and protected from light, stored in a cool and dry place.

Codeine Phosphate

$C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$ 424.39 [41444-62-6]

Codeine Phosphate is 7,8-didehydro-4,5 α -epoxy-3-methoxy-17-methylmorphinan-6 α -ol phosphate (1 : 1) (salt) sesquihydrate. It contains not less than 98.5% of $C_{18}H_{21}NO_3 \cdot H_3PO_4$, calculated on the dried basis.

Description A fine, white, needle-shaped crystalline powder; odourless; efflorescent. The aqueous solution exhibits acid reaction.

Freely solution in water; slightly soluble in ethanol; very slightly soluble in chloroform or ether.

Identification (1) Dissolve 0.2 g in 4 ml of water, add with constant stirring 20% sodium hydroxide solution dropwise until a white precipitate is produced. Scratch the inner walls of the vessel with a glass rod to complete the precipitation and filter. Wash the precipitate with water and dry at 105°C for 1 hour. The residue melts at 154-158°C (Appendix VI C).

(2) Dissolve about 0.1 g in 5 ml of water and alkalinify the solution with ammonia TS dropwise; no precipitate is formed.

(3) To about 1 mg on a porcelain plate, add 0.5 ml of sulfuric acid containing 2.5 mg of selenous acid; a green colour is immediately produced and then turns to blue.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Codeine Phosphate (Appendix XVI).

(5) Yields the reactions characteristic of phosphates (Appendix III).

Acidity Dissolve 0.4 g in 10 ml of water, pH 4.0-5.0 (Appendix VI H).

Clarity and Colour of solution A solution of 0.4 g in 10 ml of cold water is clear and colourless; any opalescence produced is not more pronounced than that of the reference suspension 1 (Appendix IX B), and its colour is not more intense than that of the reference solution Y₂ (Appendix IX A, method 1).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.10 g. Any opalescence produced is not more pronounced than that of a reference using 5.0 ml of sodium chloride standard solution (0.05%).

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 0.20 g. Any opalescence produced is not more pronounced than that of a reference using 2.0 ml of potassium sulfate standard solution (0.1%).

Morphine Dissolve 0.10 g in sufficient hydrochloric acid solution (9→1000) to produce 5 ml, add 2 ml of sodium nitrite TS, allow to stand for 15 minutes and add 3 ml of ammonia TS. Any colour produced is not more intense than that of a reference using 5.0 ml of morphine standard solution [dissolve 2.0 mg of anhydrous morphine in hydrochloric acid solution (9→1000) to produce 100 ml] (0.1%).

Loss on drying When dried to constant weight at 105°C, loses 5.0%-7.5% of its weight (Appendix VIII L).

Assay Dissolve about 0.25 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.74 mg of $C_{18}H_{21}NO_3 \cdot H_3PO_4$.

Category Analgesic and antitussive.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Codeine Phosphate Injection
(2) Codeine Phosphate Syrup
(3) Codeine Phosphate Tablets

Codeine Phosphate Injection

Codeine Phosphate Injection is a sterile solution of Codeine Phosphate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$).

Description A clear, colourless liquid.

Identification Evaporate 10 ml to dryness on a water bath. The residue complies with the tests (1), (2), (3), (5) for Identification described under Codeine Phosphate.

pH value 4.0-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a volume equivalent to 0.3 g of codeine phosphate, evaporate to dryness on a water bath and dry at 105°C for 1 hour. Cool, dissolve the residue in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 42.44 mg of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$.

Category As described under Codeine Phosphate.

Strength (1) 1 ml : 15 mg (2) 1 ml : 30 mg

Storage Preserve in well closed containers, protected from light.

Codeine Phosphate Syrup

Codeine Phosphate Syrup contains not less than 0.47% and not more than 0.54% (g/ml) of the labelled amount of Codeine Phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$).

Formula	Codeine Phosphate	5 g
	Sucrose	650 g
	Preservative	a quantity
	Water	a quantity
	To make	1000 ml

Description A colourless to pale yellow viscous liquid; taste, sweet then bitter.

Identification Alkalize 1 ml with sodium hydroxide TS, add 1 ml of chloroform, shake vigorously, allow to stand. Transfer a few drops of chloroform extract to a porcelain plate, add 0.5 ml of sulfuric acid containing 2.5 mg of selenous acid, a green colour is produced immediately and then changes to blue.

Relative density Not lower than 1.200 (Appendix VI A).

Other requirements complies with the general requirements for syrup (Appendix I K).

Assay Measure accurately 10 ml with a "to contain" pipet to a separator. Wash the inner wall of the pipet with a quantity of water. Carry out the Assay as described under Codeine Phosphate Tablets beginning at the words "make alkaline with ammonia TS...". Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 8.488 mg of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$.

Category As described under Codeine Phosphate.

Strength (1) 10 ml (2) 100 ml

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Codeine Phosphate Tablets

Codeine Phosphate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$).

Description White tablets or coated tablets.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to 0.2 g of codeine phosphate, in 5 ml of water filter, add 20% sodium hydroxide solution dropwise with frequently stirring until a white precipitate is produced then complete the precipitation by rubbing the vessel wall with a glass rod. Filter, wash the precipitate with water. Dry a portion of the residue at 105°C for 1 hour. It melts at 154-158°C (Appendix VI C). The residue complies with test (3) for Identification described under Codeine Phosphate. (2) Shake the powdered tablets with water and filter; the filtrate yields the reaction characteristic of phosphates (Appendix III).

Content uniformity Comply with the requirements

(Appendix X E). To 1 tablet in 200 ml volumetric flask add a quantity of water, shake 1 hour to dissolve codeine phosphate, dilute with water to volume, mix well and filter. Measure the absorbance of the successive filtrate at 280 nm (Appendix IV A).

Dissolution Comply with the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution after exactly 20 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of 10 µg per ml. Measure the absorbance of the resulting solution at 212 nm (Appendix IV A). Calculate the dissolution of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$ from each tablet, taking 601 as the value of A (1%, 1 cm); not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 15 tablets (30 mg) or 25 tablets (15 mg). Weigh accurately a quantity of the powder equivalent to 0.15 g of codeine phosphate into a 100 ml volumetric flask, add water to make a suspension and add 20 ml of 0.25 mol/L sulfuric acid solution, shake for about 30 minutes until codeine phosphate is dissolved. Dilute with water to volume, shake thoroughly, filter. Measure accurately 50 ml of the successive filtrate to a separator, make alkaline with ammonia TS and extract with successive quantities of chloroform (25 ml, 15 ml, 15 ml, 15 ml) until extraction of the alkaloid is complete. Wash each chloroform extract with the same 10 ml portion of water and shake the aqueous layer with 5 ml of chloroform. Combine the chloroform extracts, evaporate to dryness on a water bath. To the residue add accurately 25 ml of sulfuric acid (0.01 mol/L) VS, heat to dissolve. Cool, add 2 drops of methyl red IS and titrate with sodium hydroxide (0.02 mol/L) VS. Each ml of sulfuric acid (0.01 mol/L) VS is equivalent to 8.488 mg of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$.

Category As described under Codeine Phosphate.

Strength (1) 15 mg (2) 30 mg

Storage Preserve in tightly closed containers, protected from light.

Codeine Phosphate and Platycodon Tablets

Codeine Phosphate and Platycodon Tablets contain not less than 10.8 mg and not more than 13.2 mg of codeine phosphate ($C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$), and not less than 9 mg of total platycodon saponins in each tablet.

Formula	Liquid Extract of Platycodon Root	50 g
	Codeine Phosphate	
	$(C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O)$	12 g
	Excipient	a quantity
	to make	1000 tablets

Description Pale brown tablets or film coated tablets with pale brown core.

Identification Dissolve about 1 g of the powdered tablets in 10 ml of water and filter, the filtrate is used in test (1) and (2) for identification.

(1) Dilute 1 ml of the filtrate with water to 10 ml and shake, a persistent tiny foam is produced.

(2) Add 5 drops of the filtrate into 2 ml of glacial acetic acid and add slowly 0.5 ml of sulfuric acid, the interface shows a red to reddish-brown colour.

(3) To about 0.5 g of the powdered tablets, add 5 ml of water, shake thoroughly, add 1 ml of ammonia TS, extract with 10 ml of chloroform, wash the chloroform layer with 2 ml of water, evaporate the chloroform layer on a water bath to dryness. To the residue add 0.5 ml of sulfuric acid solution containing 2.5 mg of selenic acid, a green colour is produced immediately and changes to blue gradually.

(4) Dissolve about 1 g of the powdered tablets in 10 ml water, shake thoroughly and filter, transfer the filtrate to a separator. Extract with two 20 ml portions of ethyl acetate, evaporate the combined ethyl acetate layers to dryness, dissolve the residue in 2 ml dehydrate ethanol as the test solution. To 2 g of reference crude drug of radix platycodi add 10 ml of ethanol, soak for 24 hours and filter. Repeat the operation, using filtrate to produce the reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-water (14 : 3 : 3) as the mobile phase. Apply separately to the plate 2 μ l of each of the above two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light (365 nm). The fluorescence spots in the chromatogram obtained with the test solution correspond in position and colour to the fluorescence spots obtained with the reference drug solution.

Content uniformity Codeine Phosphate Comply with the requirements for content uniformity (Appendix X E). To 1 tablet, carry out the method in the Assay. Calculate the content of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 500 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution after exactly 30 minutes and filter through a membrane filter. The successive filtrate is used as the test solution. Measure accurately the reference solution as described under the Assay of Codeine Phosphate, dilute with water to produce a solution of 0.03 mg of codeine phosphate per ml as the reference solution. Measure accurately 10 μ l each of the test solution and the reference solution, carry out the method in the Assay of Codeine Phosphate. Calculate the dissolution of $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Codeine Phosphate Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution (adjust to pH 3.0 with phosphoric acid) - acetonitrile (3.5 : 1) as the mobile phase. Detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of codeine phosphate.

Procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets, be equivalent to about 12 mg of codeine phosphate, into a 50 ml volumetric flask, add 2.5 ml of water and sonicate to make

disintegrated. Add a quantity of methanol, ultrasonic for 10 minutes to dissolve codeine phosphate, cool, dilute with methanol to volume, shake thoroughly and filter through a membrane filter. Measure accurately 2 ml of the successive filtrate into a 10 ml volumetric flask, dilute with the mobile phase to volume and mix well as the test solution. Inject 10 μ l of the test solution into the column, record the chromatogram. Dissolve an accurately weighed quantity of codeine phosphate CRS with the mobile phase to produce a solution of about 48 μ g per ml as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{18}H_{21}NO_3 \cdot$

$H_3PO_4 \cdot 1\frac{1}{2}H_2O$ with respect to the peak area obtained in the chromatogram by the external standard method. The coefficient 1.068 is used in the calculation of the content of codeine phosphate.

Total Platycodon saponins Weigh accurately and powder 20 tablets. Dissolve an accurately weighed quantity of the powdered tablets, be equivalent to about 10 tablets, in a conical flask with stopper, add accurately 20 ml of water, tightly stoppered, ultrasonic for 15 minutes and filter. Transfer 4.0 ml of the successive filtrate into a separator, add 1 drop of concentrated ammonia solution, mix well, extract with two portions of chloroform, each of 15 ml. Discard the chloroform layer, extract the water layer with five portions of n-butanol saturated with water, each of 15 ml, combine the n-butanol layers and stand for 20 minutes. Filter the n-butanol layer into a stoppered conical flask, previously dried to constant weight, using a glass funnel with a wad of cotton wool. Evaporate the filtrate in vacuum to dryness in 90°C water bath, and dry in vacuum at 100°C for 2 hours, weigh and calculate the content of total platycodon saponins. It contains not less than 9 mg per tablet.

Category Antitussive expectorant.

Storage Preserve in tightly closed containers, stored in room temperature.

Coenzyme Q₁₀

$C_{59}H_{90}O_4$ 863.36

Coenzyme Q₁₀ is 2-(3,7,11,15,19,23,27,31,35,39-decamethyl-2,6,10,14,18,22,26,30,34,38-tetracontenyl)-5,6-dimethoxy-3-methyl-para-quinone. It contains not less than 98.0% of $C_{59}H_{90}O_4$, calculated on the anhydrous basis.

Description A yellow or orange-yellow crystalline powder; odourless; tasteless; decomposed easily on exposure to light.

Soluble in chloroform, benzene, acetone, ether and petroleum ether, very slightly soluble in ethanol, insoluble in water.

Melting range 48-52°C (Appendix VI C).

Identification (1) To the test solution obtained in the Assay, add 50 mg of sodium borohydride, the yellow colour of the solution disappears.

(2) The retention time of principal peak of the test solution in the chromatogram obtained in the Assay is identical with that of the principal peak of coenzyme Q₁₀ CRS in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of coenzyme Q₁₀ (Appendix XVI).

Related substances Protect from light throughout the procedure. Carry out the method as described under the Assay. Take the test solution obtained in the Assay as the test solution. Measure accurately 1.0 ml of the test solution obtained in the Assay to a 100 ml volumetric flask, dilute with dehydrated ethanol to volume as the reference solution. Inject 20 µl of the reference solution into the column. Adjust the attenuation so that the height of principal peak in the chromatogram is 25% full scale of the chart. Inject 20 µl each of the test solution and reference solution into the column, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak are not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Water Not more than 0.2% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using column packed with octadecylsilane bonded silica gel and a mixture of methanol-dehydrated ethanol (1 : 1) as the mobile phase. Column temperature is 35°C, detection wavelength is 275 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peak of coenzyme Q₁₀.

Procedure Dissolve 20 mg, accurately weighed, in about 40 ml of dehydrated ethanol by shaking in a 50°C water bath, cool, transfer to a 100 ml volumetric flask, dilute with dehydrated ethanol to volume, mix well, as the test solution. Inject 20 µl into the column. Repeat the operation, using coenzyme Q₁₀ CRS instead of the substance being examined. Calculate the content of C₅₉H₉₀O₄ with reference to the peak area obtained in the chromatogram by the external standard method.

Category Coenzyme.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation (1) Coenzyme Q₁₀ Capsules
(2) Coenzyme Q₁₀ Injection
(3) Coenzyme Q₁₀ Soft Capsules
(4) Coenzyme Q₁₀ Tablets

Coenzyme Q₁₀ Capsules

Coenzyme Q₁₀ Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of C₅₉H₉₀O₄.

Description Capsules containing yellow to orange-yellow powder or granules.

Identification Comply with the tests (1) and (2) for

Identification described under Coenzyme Q₁₀.

Content uniformity Protect from light throughout the procedure. Comply with the requirements for content uniformity except the limit is ±20% (Appendix X E). To the content of 1 capsule add a quantity of dehydrated ethanol, heat in a 50°C water bath with shaking to dissolve coenzyme Q₁₀, add dehydrated ethanol to produce a solution of about 0.2 mg of coenzyme Q₁₀ per ml. Transfer a quantity of the solution to a centrifuge tube with stopper, centrifuge at 300 rpm for 5 minutes. Carry out the method described under Assay using an accurately measured quantity of supernatant.

Related substances Comply with the test for related substance described under Coenzyme Q₁₀.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Protect from light throughout the procedure. To a quantity of the mixed contents in the test for weight variation of contents equivalent to about 20 mg of coenzyme Q₁₀ in a 100 ml volumetric flask, add a quantity of dehydrated ethanol, heat in a 50°C water bath with shaking to dissolve coenzyme Q₁₀, cool. Dilute with dehydrated ethanol to volume, mix well. Transfer a quantity of the solution to a centrifuge tube with stopper, centrifuge at 3000 rpm for 5 minutes. Measure accurately a quantity of supernatant and carry out the Assay described under coenzyme Q₁₀.

Category As described under Coenzyme Q₁₀.

Strength (1) 5 mg (2) 10 mg (3) 15 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Coenzyme Q₁₀ Injection

Coenzyme Q₁₀ Injection is a sterile aqueous solution of coenzyme Q₁₀. It contains not less than 90.0% and not more than 110.0% of the labelled amount of C₅₉H₉₀O₄.

Description A clear yellow liquid.

Identification Complies with the tests (1) and (2) for Identification described under Coenzyme Q₁₀.

pH value 3.2 to 5.5 (Appendix VI H).

Related substances Complies with the test for related substances described under Coenzyme Q₁₀.

Other requirements Complies with the general requirements for Injections (Appendix I B).

Assay Measure accurately 2 ml to a 25 ml volumetric flask, dilute with dehydrated ethanol to volume. Carry out the Assay described under Coenzyme Q₁₀.

Category As described under Coenzyme Q₁₀.

Strength 2 ml : 5 mg

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Coenzyme Q₁₀ Soft Capsules

Coenzyme Q₁₀ soft capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of C₅₉H₉₀O₄.

Description Soft capsules containing orange yellow oily liquid.

Identification Comply with the tests (1) and (2) for Identification described under coenzyme Q_{10} .

Related substances Carry out the test for Related substances described under coenzyme Q_{10} , using the solution prepared under the Assay as the test solution.

Other requirements Comply with the general requirements for Capsules (Appendix I E).

Assay Protect from light throughout the procedure. The quantity of the mixed contents obtained under the test for weight variation, add a quantity of anhydrous ethanol rapidly, heat in a 50°C water bath with shaking to dissolve coenzyme Q_{10} , cool, dilute with anhydrous ethanol to produce a solution of 0.2 mg per ml, mix well. Carry out the Assay as described under Coenzyme Q_{10} .

Category As described under Coenzyme Q_{10} .

Strength (1) 5 mg (2) 10 mg (3) 15 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Coenzyme Q_{10} Tablets

Coenzyme Q_{10} Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of $C_{59}H_{90}O_4$.

Description Yellow tablets.

Identification Comply with the tests (1) and (2) for Identification described under Coenzyme Q_{10} .

Content uniformity Protect from light throughout the procedure. Comply with the requirements for Content Uniformity except the limit is $\pm 20\%$ (Appendix X E). Triturate 1 tablet with dehydrated ethanol in a mortar and transfer with dehydrated ethanol in portions to a amber coloured volumetric flask, heat in a 50°C water bath with shaking to dissolve coenzyme Q_{10} , cool, add dehydrated to volume. Transfer a quantity of the solution to a centrifuge tube with stopper, centrifuge at 3000 rpm for 5 minutes. Measure accurately a quantity of the supernatant liquid and carry out the method described under Assay.

Related substances Carry out the test for Related substances described under Coenzyme Q_{10} , using the solution prepared under the Assay as the test solution.

Other requirements Comply with the general requirements for Tablets (Appendix I A).

Assay Protect from light throughout the procedure. Weigh and powder 20 tablets. To an accurately weighed quantity equivalent to about 20 mg of coenzyme Q_{10} , in a 100 ml volumetric flask, add a quantity of dehydrated ethanol, heat in a 50°C water bath with shaking to dissolve coenzyme Q_{10} , cool, dilute with dehydrated ethanol to volume. Transfer a quantity of the solution to a centrifuge tube with stopper. Centrifuge at 3000 rpm for 5 minutes. Measure accurately a quantity of the supernatant and carry out the Assay described under Coenzyme Q_{10} .

Category As described under Coenzyme Q_{10} .

Strength (1) 5 mg (2) 10 mg (3) 15 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Colchicine

$C_{22}H_{25}NO_6$ 399.44

[64-86-8]

Colchicine is an alkaloid isolated from the corm of *Iphigenia indica* Kunth et Benth. (Liliaceae). It contains not less than 97.0% and not more than 103.0% of $C_{22}H_{25}NO_6$, calculated on the dried, solvent-free basis.

Description A pale yellow crystalline powder; odourless; darkens on exposure to light.

Freely soluble in ethanol or chloroform; soluble in water, but moderately concentrated solutions may deposit crystals of a hemihydrate; very slightly soluble in ether.

Melting range 148-153°C, with decomposition (Appendix VI C).

Specific optical rotation -425° to -450° , in a solution of 10 mg per ml in water (Appendix VI E), calculated on the dried, solvent-free basis.

Identification (1) Measure the light absorptions of the solution obtained in the Assay at 243 nm and 350 nm (Appendix IV A), the ratio of the absorbance at 243 nm to that at 350 nm is 1.70-2.00.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of colchicine (Appendix XVI).

Chloroform and ethyl acetate Reference preparation To 1 ml, accurately measured, of ethanol-free chloroform in a 1000 ml volumetric flask, add 20 ml of internal standard solution (1.0% ethanol); to 1 ml, accurately measured, of ethanol-free ethyl acetate in another 1000 ml volumetric flask, add 100 ml of the internal standard solution. Dilute each with water to volume and mix well.

Test preparation Weigh accurately 3 separate portions of about 0.25 g each, in three 10 ml volumetric flasks, add accurately 0 ml, 0.2 ml or 1 ml of internal standard solution, dilute with water to volume, mix well.

Procedure Carry out the method for gas chromatography (Appendix V E), using a 2 m long column packed with 10% (g/g) polyethylene glycol 1000. Maintain the column temperature at 75°C. The sum of the contents of chloroform, ethyl acetate and the percentage loss on drying determined in the test below is not more than 10.0%.

Loss on drying When dried in vacuum over phosphorus pentoxide for 24 hours, loses not more than 3.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve a quantity, accurately weighed, in water to produce a solution of 10 μ g per ml, measure the absorbance at 350 nm (Appendix IV A). Calculate the content of $C_{22}H_{25}NO_6$, taking 425 as the value of A (1%, 1 cm).

Category Anti-gout and antineoplastic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Colchicine Tablets

Colchicine Tablets

Colchicine Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of colchicine ($C_{22}H_{25}NO_6$).

Description White tablets.

Identification Mix a quantity of the powdered tablets containing 1 mg of colchicine with 0.2 ml of sulphuric acid in a white dish; a lemon colour is produced. Add 0.05 ml of nitric acid; the colour changes to greenish blue and then rapidly becomes reddish and finally yellow or almost colourless. Add an excess of 5 mol/L sodium hydroxide, the colour changes to red.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with water and transfer to a 50 ml (for strength 0.5 mg) or 100 ml (for strength 1 mg) volumetric flask, add 40 ml or 80 ml of water, dilute with water to volume, shake thoroughly and filter. Measure the absorbance of the filtrate at 350 nm (Appendix IV A), calculate the content of $C_{22}H_{25}NO_6$, taking 425 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and finely powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 1.0 mg of colchicine to a 100 ml volumetric flask, add about 50 ml of water, shake for 1 hour to dissolve colchicine, add water to volume and mix well. Filter and measure the absorbance of the successive filtrate at 350 nm (Appendix IV A). Calculate the content of $C_{22}H_{25}NO_6$, taking 425 as the value of A (1%, 1 cm).

Category As described under Colchicine.

Strength (1) 0.5 mg (2) 1 mg

Storage Preserve in tightly closed containers, protected from light.

Colistin Sulfate

[1264-72-8]

Colistin Sulfate is an antibiotic mixture of polymyxins. It has a potency of not less than 17000 Colistin Units per mg, calculated on the dried basis.

Description A white to pale-yellow powder; odourless or almost odourless; hygroscopic. Freely soluble in water; slightly soluble in ethanol; practically insoluble in acetone, chloroform or ether.

Identification (1) To about 20 mg add 2 ml of phosphate buffer solution (pH 7.0), 0.2 ml of 0.5% ninhydrin solution and heat to boil; a violet colour is produced.

(2) Dissolve about 2 mg in 5 ml of water, add 5 ml of 10% sodium hydroxide solution and 5 drops of 1% copper sulfate solution and shake thoroughly after each drop; a reddish-violet colour is produced.

(3) The aqueous solution yields the reactions characteristic

of sulfates (Appendix III).

Acidity An aqueous solution of 10 mg per ml, pH 4.0-6.5 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 6.0% of its weight (Appendix VIII L), using 0.2-0.3 g.

Assay Weigh accurately a quantity and add sterile water to produce a solution of about 10000 units per ml, carry out the microbiological assay of antibiotics (Appendix XI A).

Category Antifungal.

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Preparation Colistin Sulfate Tablets

Colistin Sulfate Tablets

Colistin Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of colistin.

Description White to pale yellow tablets.

Identification Triturate 1 tablet with a quantity of water to dissolve colistin sulfate and filter, the filtrate complies with the tests for Identification described under Colistin Sulfate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder equivalent to about 250000 colistin units, carry out the Assay described under Colistin Sulfate.

Category As described under Colistin Sulfate.

Strength (1) 500000 units (2) 1000000 units
(3) 3000000 units

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Colloidal Bismuth Pectin

Colloidal Bismuth Pectin is a complex of uncertain composition of pectin and Bismuth. It contains not less than 14.0% and not more than 16.0% of bismuth pectin, calculated on the bismuth.

Description Yellow powder; odourless; flavourless. Practically insoluble in ethanol or organic solvents; agglomerate in water, uniformly disperse in water when shaking.

Identification (1) To 5 mg add 10 ml of water, stir, acidify with dilute sulfuric acid, add drops of 10% thiourea solution, a dark yellow colour is produced.

(2) To 10 mg add 25 ml of water, stir, acidify with dilute sulfuric acid, add drops of potassium iodate TS, a brownish-red or brownish-black precipitate is produced; separate the precipitate and dissolve in an excess of potassium iodate TS to produce an orange yellow solution, dilute with water to produce an orange precipitate.

(3) To 0.1 g add 10 ml of hot water, stir, cool, add 10 ml of ethanol to produce a gelatification.

Alkalinity Dissolve 50 mg of the dried substance in 50 ml of

water, shake well, pH 8.5-10.5 (Appendix VI H).

Colloid stability To 0.25 g in a 100 ml measuring cylinder with stopper add water to volume, shake thoroughly for 1 minute to a gelatinoid solution, allow to stand for 1 hour, the colloid is not less than 97 ml.

Sulfate Wet 2.0 g with 6 ml of hydrochloric acid, add water to 100 ml and filter. Dispart 50 ml of the successive filtrate into two portions. To the portion add 5 ml of 25% barium chloride solution, allow to stand for 10 minutes, filter again and again until the filtrate is clear; add 4.0 ml of potassium sulfate standard solution, shake well, allow to stand for 10 minutes as the reference solution. To another portion add 5 ml of 25% barium chloride solution, allow to stand for 10 minutes. Carry out the limit test for sulfates (Appendix VIII B), any opalescence produced is not more pronounced than that of the reference solution (0.08%).

Nitrate To 50 mg add 100 ml of water, stir and filter. To 20 ml of the successive filtrate add 2 ml of sulfanilic acid- α -naphthylamine TS and 10 mg of zinc powder, allow to stand for 15 minutes. Any colour produced is not more intense than that of the potassium nitrate standard solution, using 0.6 ml produced by same method (dissolve 81.5 mg of potassium nitrate previously, measured accurately and dried to constant weight at 105°C, in a quantity of water in 50 ml volumetric flask, dilute with water to volume, shake well; measure accurately 5 ml to 100 ml volumetric flask, dilute with water to volume, shake well. Each ml of the solution is equivalent to 0.05 mg of NO_3^-) (0.3%).

Lead Ignite andante 1.0 g in a crucible until the carbonization is complete, cool; add 0.5-1 ml of sulfuric acid, evaporate by heating until the vapor of sulfuric acid is removed; ignite the residue in a crucible at 600°C until the incineration is complete, cool; add 0.5 ml of nitric acid dropwise to dissolve the residue, heat on a water bath to dryness, cool, add 5 ml of potassium hydroxide solution (1→6), stir, heat to boil for 2 minutes, supply a quantity of water to the former volume and filter. Wash the residue with water, combine the filtrate and washings, adjust to pH7 with acetic acid, add 2 ml of acetate BS, dilute with water to 25 ml, add 2 ml of thioacetamide TS, shake well and allow to stand for 2 minutes. Any colour produced is not more intense than that of a reference lead standard solution operated in the same manner using 2.0 ml (0.002%).

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid, add 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.5 g, accurately weighed, in 5 ml of nitric acid solution (1→2) by heating, add 150 ml of water and two drops of xylenol orange IS, titrate with disodium edetate (0.05 mol/L) VS to yellow colour. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 10.45 mg of Bi.

Category Anti-ulcerative.

Storage Preserve in tightly closed containers, protected from light.

Preparation Colloidal Bismuth Pectin Capsules

Colloidal Bismuth Pectin Capsules

Colloidal Bismuth Pectin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Bi.

Description Hard capsules with yellow powders or

granules.

Identification The contents of capsules comply with the tests for Identification described under Colloidal Bismuth Pectin.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Mix a quantity of the contents in the test for weight variation, Weigh accurately a quantity equivalent to about 75 mg of Bi. Carry out the test for Assay described under Colloidal Bismuth Pectin.

Category As described under Colloidal Bismuth Pectin.

Strength (1) 40 mg (2) 50 mg (calculated on Bi)

Storage Preserve in tightly closed containers and protected from light.

Colloidal Chromium Phosphate [^{32}P] Injection

Colloidal Chromium Phosphate [^{32}P] Injection is a sterile colloidal dispersion of chromium phosphate [^{32}P]. It contains not less than 90.0% and not more than 110.0% of the labelled amount of radioactive concentration of phosphorus [-32] at the date and hour stated on the label.

Description A green colloidal liquid.

Identification (1) Complies with the test (1) for Identification described under Sodium Phosphate [^{32}P] Oral Solution.

(2) The principal spot obtained in the determination of Radiochemical purity has a prominent radioactive peak with R_f value of 0-0.1.

pH value 6.0-8.0 (Appendix VI H).

Colloidal particles size When viewed under an electron microscope, not less than 60% of the colloidal particles are 20-50 nm in diameter.

Bacterial endotoxin Dilute a quantity with Water BET for at least 15 times of its original volume; less than 15 EU/ml (Appendix XI E).

Sterility Carry out the test for sterility (Appendix XI H), the result complies with the requirements.

Radiochemical purity Carry out the determination of radiochemical activity (purity) (Appendix XIII, method 1), using acetic acid-water (0.5 : 100) as the mobile phase. Not less than 98% of the total radioactivity is found in the spot corresponding to chromium phosphate [^{32}P].

Radioactive concentration Not less than 37 MBq per ml (Appendix XIII).

Category Radiopharmaceutical.

Strength (1) 185 MBq (2) 370 MBq

Storage Preserve in well closed lead containers, stored in a cool place. The intensity of radiation on the surface of the container complies with relevant regulation.

Compound Almitrine Tablets

Compound almitrine tablets contain not less than

90.0% and not more than 110.0% of the labelled amount of almitrine bismesylate ($C_{26}H_{29}F_2N_7 \cdot 2CH_3SO_3H$) and raubasine ($C_{21}H_{24}N_2O_3$) respectively.

Formula	Almitrine bismesylate	30 g
	Raubasine	10 g

To make 1000 tablets

Description Film coated tablets with white or almost white core.

Identification The retention time of principal peaks of almitrine bismesylate and raubasine in the substance being examined in the chromatogram obtained in the Assay are identical with that of the principal peaks of almitrine bismesylate CRS and raubasine CRS in the chromatogram of the reference solution correspondingly.

Related substance Remove the film coating of tablets, the core contains bilayer, separate the external layer containing raubasine from the internal layer containing almitrine bismesylate. Dissolve a quantity of finely powdered external layer in chloroform to produce a solution of 10 mg of raubasine per ml, filter and use the successive filtrate as the test solution. Measure accurately a quantity of the test solution to produce three solutions in chloroform containing (1) 0.05 mg per ml, (2) 0.10 mg per ml, (3) 0.20 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B). Using silica gel GF₂₅₄ and a mixture of chloroform-methanol (40 : 0.1) as the mobile phase. Apply separately to the plate 10 μ l each of above four solutions, after developing and removal of the plate, dry it in air, examine under ultraviolet light at 254 nm. The intensity of any secondary spot in the chromatogram obtained with the test solution, is compared with that of the principal spots obtained with solution (1), (2), (3), the total impurity is not more than 4%.

Dissolve a quantity of finely powdered internal layer in methanol to produce a solution of 20 mg of almitrine bismesylate per ml, filter, use the successive filtrate as the test solution. Measure accurately a quantity of the test solution to produce three solutions in methanol containing (1) 0.10 mg per ml, (2) 0.20 mg per ml (3) 0.40 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B). Using silica gel GF₂₅₄ and the supernatant liquid of n-hexane-dichloromethane-ether-concentrated ammonia water (38 : 25 : 12 : 1.0) as the mobile phase. Apply separately to the plate 5 μ l each of above four solutions, after developing and removal of the plate, dry it in air, expose the plate to iodine vapor until the colour of spot changes and examine immediately. The intensity of any secondary spot, in the chromatogram obtained with the test solution, is compared with that of the principal spots obtained with Solution (1), (2), (3), the total impurity is not more than 2.5%.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer 1 tablet to a 100 ml volumetric flask, add a quantity of the mobile phase in the Assay, ultrasonicate for 30 minutes, cool and dilute with the mobile phase to the volume, mix well, filter, use the successive filtrate as the test solution. Carry out the method described under the Assay and calculate the content.

Dissolution Carry out the dissolution test (Appendix X C, method 2). Using hydrochloride acid solution (0.5→1000) 1000 ml as dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution as test solution after exactly 45 minutes and filter. Dilute a portion of the successive filtrate with 20 volumes of

the mobile phase described under the Assay as the test solution. Weigh accurately a quantity of almitrine bismesylate CRS and raubasine CRS to the same volumetric flask, add the dissolution medium to produce a solution of 30 μ g of almitrine bismesylate CRS per ml and 10 μ g of raubasine CRS per ml, then dilute a portion of the solution with 20 volumes of the mobile phase as reference solution. Inject separately 20 μ l each of the two solutions into the column, carry out the method described under the Assay, calculate the dissolutions of $C_{26}H_{29}F_2N_7 \cdot 2CH_3SO_3H$ and $C_{21}H_{24}N_2O_3$ form each tablet, not less than 70% of the labelled amount is dissolved respectively.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D). Using a column packed with octadecylsilate bonded silica gel and a mixture of methanol-water (85 : 15) (add 5 μ l of diethylamine in 1000 ml) as the mobile phase. Detection wavelength is 222 nm. The number of theoretical plates of the column is not less than 900, calculated with reference to the peaks of almitrine bismesylate and raubasine respectively. The resolution factor between the peaks of almitrine bismesylate and raubasine complies with the related requirements.

Procedure weigh accurately and powder finely 10 tablets, dissolve a quantity of the powdered tablets equivalent to about 30 mg of almitrine bismesylate and 10 mg of raubasine in a quantity of the mobile phase in a 100 ml volumetric flask, ultrasonicate for 30 minutes, cool and dilute with the mobile phase to volume, mix well, filter. Inject 20 μ l of the successive filtrate into the column and record the chromatogram. Weigh accurately a quantity of almitrine bismesylate CRS and raubasine CRS respectively, dilute with the mobile phase to produce two solutions of 0.3 mg of almitrine bismesylate CRS per ml and 0.1 mg of raubasine CRS per ml. Measure in the same manner. Calculate the contents of $C_{26}H_{29}F_2N_7 \cdot 2CH_3SO_3H$ and $C_{21}H_{24}N_2O_3$ respectively.

Category Nootropic.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Compound Aspartate, Vitamin B₆ and Dipotassium Glycyrhetate Eye Drops

Compound Aspartate, Vitamin B₆ and Dipotassium Glycyrhetate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of Naphazoline Hydrochloride ($C_{14}H_{14}N_2 \cdot HCl$), Aspartic Acid ($C_4H_7NO_4$), Vitamin B₆ ($C_8H_{11}NO_3 \cdot HCl$), Dipotassium Glycyrhetate ($C_{42}H_{60}K_2O_{16}$) and Neostigmine Methylsulfate ($C_{13}H_{22}N_2O_6S$) respectively; not less than 85.0% and not more than 115.0% of the labelled amount of Chlorphenamine Maleate ($C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$).

Formula	Aspartic Acid	7.8 g
	Vitamin B ₆	0.5 g
	Dipotassium Glycyrhetate	1.0 g
	Naphazoline Hydrochloride	0.03 g
	Neostigmine Methylsulfate	0.05 g
	Chlorphenamine Maleate	0.1 g
	Excipient	a sufficient quantity

Water for Injection a sufficient quantity

To make 1000 ml

Description A clear, faintly yellow liquid.

Identification The retention time of the principal peaks of the substances being examined in the chromatogram of the Assay corresponds to those of the reference substances.

pH value 4.5-6.5 (Appendix VI H).

Colour The absorbance at 430 nm is not more than 0.06 (Appendix IV A).

Osmolality 0.9-1.1 (Appendix IX G).

Other requirements Comply with the general requirements for eye preparations (Appendix I G).

Assay *Vitamin B₆, neostigmine methylsulfate, naphazoline hydrochloride, chlorphenamine maleate, and dipotassium glycyrrhetate* Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a solution of sodium heptanesulphonate (dissolve 4.04 g of sodium heptanesulphonate and 2.72 g of potassium dihydrogen phosphate in 1000 ml of water, adjust pH to 3.0 with phosphoric acid) as mobile phase A, acetonitrile as mobile phase B, perform a gradient elution program as following table. The flow rate is 1.0 ml/min and detection wavelength is 260 nm, changed to 220 nm in 10 minutes. The retention time of the principal peaks of the substance being examined in the chromatogram is as follows; vitamin B₆: 6-9 minutes; neostigmine methylsulfate: 16-18 minutes; naphazoline hydrochloride: 23-26 minutes; chlorphenamine maleate: 27-30 minutes; dipotassium glycyrrhetate: 31-34 minutes. The number of the theoretical plates of the column is not less than 5000, calculated with reference to the peak of vitamin B₆. The resolution factor among the peaks of each component complies with the related requirements.

Time(min)	Mobile phase A(%)	Mobile phase B(%)
0	85	15
6	85	15
15	73	27
25	65	35
35	55	45
40	55	45
42	85	15
45	85	15

Procedure Measure accurately 10 ml of the eye drops to a 25 ml volumetric flask, dilute with water to volume, mix well. Inject 20 μ l of the resulting solution into the column, record the peak area correspondingly obtained in the chromatogram. Dissolve an accurately weighed quantity of vitamin B₆ CRS, neostigmine methylsulfate CRS, naphazoline hydrochloride CRS, chlorphenamine maleate CRS and dipotassium glycyrrhetate CRS with water to produce a solution of 0.2 mg of vitamin B₆, 0.02 mg of neostigmine methylsulfate, 0.012 mg of naphazoline hydrochloride, 0.04 mg of chlorphenamine maleate, and 0.4 mg of dipotassium glycyrrhetate per ml. Inject 20 μ l of the resulting solution into the column, calculate the content of C₈H₁₁NO₃ · HCl, C₁₃H₂₂N₂O₆S, C₁₄H₁₄N₂ · HCl, C₁₆H₁₉ClN₂ · C₄H₄O₄, C₄₂H₆₀K₂O₁₆.

Aspartic acid Carry out the method for high performance liquid chromatography (Appendix V D), using a column

packed with aminosilane bonded silica gel and a mixture of solution of potassium dihydrogen phosphate (dissolve 5.44 g of potassium dihydrogen phosphate in water, dilute to 1000 ml)-acetonitrile (58 : 42) as mobile phase. Detection wavelength is 220 nm. Dissolve a quantity of aspartic acid CRS and dipotassium glycyrrhetate CRS with water to produce a solution of 1.56 mg of aspartic acid and 0.2 mg of dipotassium glycyrrhetate per ml. Inject 20 μ l of the resulting solution into the column and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of aspartic acid. The resolution factor between the peaks of dipotassium glycyrrhetate and aspartic acid complies with the related requirements.

Procedure Measure accurately 2 ml of the eye drops to a 10 ml volumetric flask, dilute with water to volume, mix well. Inject 20 μ l of the resulting solution into the column, record the peak area correspondingly obtained in the chromatogram. Accurately weigh about 78 mg of aspartic acid in 50 ml volumetric flask, dissolve with water and dilute to the volume, mix well. Inject 20 μ l of the resulting solution into the column, calculate the content of C₄H₇NO₄.

Category Ophthalmics.

Strength (1) 13 ml (2) 15 ml

Storage Preserve in well closed containers.

Compound Glycyrrhiza Oral Solution

Compound Glycyrrhiza Oral Solution contains not less than 0.0765 mg and not more than 0.104 mg of anhydrous morphine (C₁₇H₁₉NO₃) per ml; and contains not less than 4.50 mg and not more than 5.50 mg of guaifenesin (C₁₀H₁₄O₄) per ml.

Formula	Liquid Extract of Liquorice Root	120 ml
	Compound Camphor Tincture	180 ml
	Glycerin	120 ml
	Guaifenesin	5 g
	Concentrated Ammonia Solution	a quantity
	Water	a quantity
	To make	1000 ml

Production Mix well the liquid extract of liquorice root and glycerin, add water 500 ml to the mixture, add cautiously a quantity of concentrated ammonia solution and adjust to pH 8-9, add the solution of guaifenesin (dissolve the guaifenesin in a quantity of hot water) with constant stirring, add compound camphor tincture, add water to produce 1000 ml and mix well. A quantity of stabilizing agent must be added.

Description A brown or brown-black liquid; odour, fragrance; taste, sweet; a little of precipitate may be produced during the storage period.

Identification (1) Mix a quantity well, transfer 10 ml into a separator. Adjust to pH about 2 with hydrochloride acid and mix well, extract with two 20 ml portions of chloroform and combine the extracts. Wash the extracts with 10 ml of water and filter the chloroform layer through anhydrous sodium sulfate, evaporate the filtrate in vacuum to dryness. Add 2 drops of formaldehyde TS and 0.5 ml of sulfuric acid to the residue, intense purple-red colour is produced immediately.

(2) Adjust the acid aqueous solution obtained under the Identification test (1) to pH value 9-10 with ammonia TS. Extract with a mixture of chloroform-isopropanol (3 : 1)

two times, each of 20 ml, and combine the extracts. Filter the extracts through anhydrous sodium sulfate, evaporate the filtrate in vacuum to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of morphine CRS in methanol and dilute to produce a solution of 1.0 mg per ml as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-acetone-anhydrous ethanol-concentrated ammonia TS (20 : 20 : 5 : 0.6) as the mobile phase. Apply separately to the plate 10 μ l each of above two solutions, after developing and removal of the plate, dry it in air, spray with Potassium Iodobismuthate, Dilute TS. The colour and position of the principal spots in the chromatogram obtained with the test solution correspond to the principal spots in the chromatogram obtained with reference solution.

(3) Mix a quantity well, to 3 ml add 5 ml of hydrochloride acid and 30 ml of chloroform, heat under reflux for 1.5 hours at 85°C, cool and filter the chloroform layer through anhydrous sodium sulfate, evaporate the filtrate to dryness. Dissolve the residue in 1 ml of methanol as the test solution. Dissolve a quantity of glycyrrhetic acid CRS in methanol and dilute to produce a solution of 0.5 mg per ml as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of petroleum ether (bp 60-90°C)-benzene-ethyl acetate-glacial acetic acid (10 : 20 : 7 : 1) as the mobile phase. Apply separately to the plate 10 μ l each of above two solutions, after developing and removal of the plate, dry it in air. Then spray with 10% phosphomolybdic acid solution of ethanol, heat at 105°C till the spots appear clearly. The colour and position of the principal spots in the chromatogram obtained with the test solution correspond to the principal spots in the chromatogram obtained with reference solution.

pH value 6.0-9.0 (Appendix VI H).

Other requirements Except clarity, complies with the general requirements for oral solution (Appendix I O).

Assay Morphine Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-0.0025 mol/L sodium heptanesulfonate solution-acetomitrile (5 : 5 : 2) as the mobile phase. Detection wavelength is 220 nm. The number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

System suitability test for solid phase extraction column Using a column packed with octadecylsilane bonded silica gel, carry out the test as described under the Procedure. Transfer 0.5 ml of a 5% acetic acid solution containing 0.1 mg morphine CRS per ml, accurately measured, to the column pretreated. Collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate and the reference solution as described under the Procedure into the column respectively, record the peak areas correspondingly obtained in the chromatogram. The ratio of the peak areas of morphine obtained in the chromatogram of the eluate to the peak areas of morphine obtained in the chromatogram of reference solution is not less than 0.97 and not more than 1.03.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH value about 9 (add drops of ammonia TS to a quantity of water until the pH value of the solution is about 9), until the pH value of the eluate is about 9. Sonicate a quantity for 10 minutes and mix well. Measure accurately 0.5 ml to the

above washed column, drop a quantity ammonia TS to adjust pH value of the solution in the column to about 9 (define the quantity of ammonia TS using another same volume of the successive filtrate previously), mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution, and collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 20 μ l of the eluate into the column and record the chromatogram. Repeat the operation, using a 5% acetic acid solution containing morphine CRS 0.01 mg per ml instead of the eluate. Calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Guaifenesin Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-0.0025 mol/L sodium heptanesulfonate solution-acetomitrile (18 : 18 : 10) as the mobile phase. Detection wavelength is 220 nm. The number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of guaifenesin.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml water in sequence, then wash the column with the ammonia solution of pH value about 9 until the pH value of the eluate is about 9. Sonicate a quantity for 10 minutes and mix well, measure accurately 1.0 ml into a 50 ml volumetric flask, dilute with water to volume and mix well. Measure accurately 0.5 ml to the above washed column, and collect the eluate to a 5 ml volumetric flask. Elute with 5% acetic acid solution containing 30% methanol after no solvent drips. Collect the eluate into the 5 ml of volumetric flask to volume and mix well. Inject 20 μ l of the eluate into the column and record the chromatogram. Dissolve a quantity of guaifenesin CRS, accurately weighed, in 5% acetic acid solution containing 30% methanol to produce a solution of 0.01 mg per ml as reference solution. Repeat the operation, using the reference solution instead of the eluate. Calculate the content of $C_{10}H_{14}O_4$ with respect to the peak areas obtained in chromatogram by the external standard method.

Category Antitussive expectorant

Strength (1) 10 ml (2) 100 ml (3) 120 ml
(4) 180 ml (5) 500 ml (6) 2000 ml
(7) 2500 ml

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Compound Liquorice Tablets

Compound Liquorice Tablets contain not less than 0.36 mg and not more than 0.44 mg of anhydrous morphine ($C_{17}H_{19}NO_3$) in each tablet.

Formula Extract of liquorice (medium powder) 112.5 g

Opium powder or powdered	
poppy capsule extractive	4 g
Camphor	2 g
Anise oil	2 g
Sodium benzoate (medium powder)	2 g

To make 1000 tablets

Processing Dry and pulverize the extract of liquorice, add sodium benzoate and opium powder, mix well and make granules. Add camphor, previously dissolved in a small

quantity of ethanol and anise oil, mix well and compress into tablets.

Description Brown or dark brown tablets; odour, characteristic; taste, sweet; hygroscopic.

Identification (1) Shake thoroughly 2 powdered tablets with 7 ml of water and adjust the mixture to about pH 9 with 10% anhydrous sodium carbonate solution. Extract twice with 20 ml each of a mixture of chloroform-isopropanol (3 : 1). Wash the combined extracts with a small quantity of ammonia TS and water in sequence, evaporate the extracts to dryness, dissolve the residue in 0.3 ml of methanol as the test solution; dissolve a quantity of morphine CRS in methanol to produce a solution of 2 mg per ml as the reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (35 : 10 : 5) as the mobile phase. Apply separately to the same plate 10 µl each of the solutions, after developing and removal of the plate, dry it in air, spray with potassium iodobismuthate TS. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) Dissolve a quantity of powdered tablets in water, filter. To a small quantity of the filtrate add 1-2 drops of diluted sulfuric acid, a faint brown precipitate is produced immediately, which is very soluble in concentrated ammonia solution.

Other requirements Comply with the general requirements for tablets except the disintegration test (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.05 mol/L potassium dihydrogen phosphate solution-0.0025 mol/L Sodium heptanesulfonate solution-acetonitrile (5 : 5 : 2) as the mobile phase. The detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

System suitability test for solid phase extraction column

Using a column packed with octadecylsilane bonded silica gel, carry out the test as described under the Procedure. Transfer 1 ml of a solution containing 0.05 mg morphine CRS per ml, accurately measured, to the column pretreated. Collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 µl of the eluate and the reference solution described under the Procedure into the column respectively, record the peak areas correspondingly obtained in the chromatogram. The ratio of the peak areas of morphine obtained in the chromatogram of the eluate to the peak areas of morphine obtained in the chromatogram of reference solution is not less than 0.97 and not more than 1.03.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH about 9 (add drops ammonia TS to a quantity of water until the pH of the solution is about 9), until the pH of the eluate is about 9. Weigh accurately and powder 20 tablets. Triturate a quantity of the powder, accurately weighed, equivalent to about 10 tablets in a conical flask, accurately add 90 ml of water, treated by ultrasonic for 5 minutes, accurately add 10 ml of dilute hydrochloride solution (6 → 10), shake well, dissolve morphine by ultrasonic treatment, cool to room temperature and filter. Measure accurately 1.0 ml of successive filtrate to the above washed column, drop a quantity of ammonia TS to adjust pH of the solution in the

column to about 9 (define the quantity of ammonia TS using another same volume of the successive filtrate previously), mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution contains 2% methanol, and collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 20 µl of the eluate into the column and record the chromatogram. Dissolve and dilute a quantity of morphine CRS with the 5% acetic acid solution contains 2% methanol to produce a solution of 0.01 mg per ml. Repeat the operation, calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Category Antitussive expectorant.

Storage Preserve in tightly closed containers, stored in a dry place.

Compound Miconazole Nitrate Cream

Compound miconazole nitrate cream contains not less than 90.0% and not more than 110.0% of the labelled amount of miconazole nitrate ($C_{18}H_{14}Cl_4N_2O \cdot HNO_3$) and clobetasol propionate ($C_{25}H_{32}ClFO_5$) respectively.

Formula	Miconazole Nitrate	20 g
	Clobetasol Propionate	0.5 g
	Creamy Base	a quantity
	To make	1000 g

Description A creamy white cream.

Identification (1) Dissolve about 2 g in 20 ml of anhydrous ethanol by gentle heating, evaporate filtrate to dryness on the water bath, cool and filter, drop a quantity of diphenylamine IS, a blue colour is produced.

(2) The retention time of principal peaks of clobetasol propionate and miconazole nitrate in the substance being examined in the chromatogram obtained in the Assay are identical with that of the principal peaks of clobetasol propionate CRS and miconazole nitrate CRS in the chromatogram obtained of the reference solution correspondingly.

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D). Using a column packed with octadecylsilane bonded silica gel and a mixture of 0.5% ammonium acetate solution-acetonitrile-methanol (24 : 38 : 38) as the mobile phase. Detection wavelength is 240 nm, column temperature is 35°C. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of miconazole nitrate. The resolution factor among the peaks of clobetasol propionate, miconazole nitrate and internal standard substance complies with the related requirements.

Internal standard solution Measure accurately 0.4 mg of dibutyl phthalate into a 100 ml volumetric flask, dilute with methanol to volume, mix well.

Procedure Weighed accurately about 2.5 g in a beaker, add accurately measured 1 ml of internal standard solution. Add 20 ml of methanol, heat in water bath at 80°C with intermittent stirring until the cream is completely dissolved, cool on ice-water bath until the base is completely freed, filter and repeat the extraction with 15 ml and 10 ml of methanol separately, combine the filtrate and washings to a 50 ml volumetric flask, add methanol to the volume, mix

well. Freezing for 2 hours and filter quickly. Inject 20 μ l of the successive filtrate into the column. Dissolve 12.5 mg of clobetasol propionate CRS, accurately weighed, in methanol in a 25 ml volumetric flask, dilute to volume, mix well. Weigh accurately 50 mg of miconazole nitrate CRS in a 50 ml volumetric flask, transfer 2 ml of the clobetasol propionate solution and 1 ml of the internal standard solution, both measured accurately, into the same volumetric flask, dilute with methanol to the volume, mix well. Measure in the same manner, Calculate the contents of $C_{18}H_{14}Cl_4N_2O \cdot HNO_3$ and $C_{25}H_{32}ClFO_5$ respectively.

Category Dermics.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Compound Platycodon Tablets

Compound Platycodon Tablets contain not less than 2.7 mg and not more than 3.3 mg of anhydrous morphine ($C_{17}H_{19}NO_3$) in each tablet.

Formula	Powdered Opium	30 g
	Powdered Platycodon Root	90 g
	Potassium Sulfate	180 g
	Excipient	a quantity
	To make	1000 tablets

Description Pale brown tablets.

Identification Comply with tests for Identification described under Opium, using a quantity of the powdered tablets equivalent to about 0.1 g of powdered opium.

Other requirements Comply with the general requirements for tablets (Appendix I A), but the disintegration time is 20 minutes.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octylsilane bonded silica gel and a mixture of 0.05 mol/L dihydrogen phosphate solution-0.0025 mol/L sodium heptanesulfonate solution-acetonitrile (2 : 2 : 1) as the mobile phase. The detection wavelength is 220 nm and the number of the theoretical plates of the column is not less than 1000, calculated with reference to the peak of morphine.

System suitability test for solid phase extraction column Using a column packed with octadecylsilane bonded silica gel, carry out the test as described under the Procedure. Transfer 1 ml of a solution of 0.3 mg morphine CRS per ml, accurately measured, to the column pretreated. Collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate and the reference solution described under the Procedure into the column respectively, record the peak areas correspondingly obtained in the chromatogram. The ratio of the peak areas of morphine obtained in the chromatogram of the eluate to the peak areas of morphine obtained in the chromatogram of reference solution is not less than 0.97 and not more than 1.03.

Procedure Wash a solid phase extraction column with 15 ml of a mixture of methanol-water (3 : 1) and 5 ml of water in sequence, then wash the column with the ammonia solution of pH about 9 (add drops ammonia TS to a quantity of water until the pH of the solution is about 9), until the pH of the eluate is about 9. Weigh accurately and powder 20 tablets. Triturate a quantity of the powder, accurately weighed, equivalent to about 1 tablet in a conical flask, accurately add

10 ml of 5% acetic acid solution, dissolve morphine with ultrasonic treatment, cool to room temperature and filter. Measure accurately 1 ml of successive filtrate to the above washed column, drop a quantity of ammonia TS to adjust pH of the solution in the column to about 9 (define the quantity of ammonia TS using another same volume of the successive filtrate previously), mix well, rinse with 20 ml of water after no solvent drips. Elute with 5% acetic acid solution contains 2% methanol, and collect the eluate into a 5 ml of volumetric flask to volume and mix well. Inject 10 μ l of the eluate into the column and record the chromatogram. Dissolve and dilute a quantity of morphine CRS with the 5% acetic acid solution contains 2% methanol to produce a solution of 0.06 mg per ml. Repeat the operation, calculate the content of $C_{17}H_{19}NO_3$ with respect to the peak areas obtained in the chromatogram by the external standard method.

Category Antitussive expectorant.

Storage Preserve in tightly closed containers, and protected from light.

Compound Sodium Chloride Eye Drops

Compound sodium chloride eye drops contain 0.50%-0.61% (g/ml) of total chlorides (Cl).

Formula	Sodium chloride	9.0
	Potassium chloride	0.14 g
	Sodium bicarbonate	0.20 g
	Hydroxypropyl methyl cellulose	5.0 g
	Preservation	a quantity
	Water for injection	a quantity
	To make	1000 ml

Description A clear, colourless, slightly viscous liquid.

Identification (1) Yields the reactions characteristic of sodium, potassium, bicarbonate salts and chlorides (Appendix III).

(2) Heat 2 ml of eye drops, a white precipitate is produced immediately, which disappears after cooling.

pH Value 6.5-8.5 (Appendix VI H).

Viscosity Kinematic viscosity 4.5-8.5 mm²/s at 25°C (Appendix VI G, method 1, using a capillary tube; 0.8 mm in internal diameter).

Other requirements Comply with the general requirements for the eye drops (Appendix VI H).

Assay Measure accurately 10 ml with a "to contain" pipette into a conical flask, wash the interior of pipette with 50 ml of water in portions, combine the washings to the same conical flask, add 10 drops of potassium chromate IS, titrate with silver nitrate (0.1 mol/L) VS until the colour turns to light red, Each ml silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of Cl.

Category Used for ophthalmic disorder.

Strength 0.55 g/ml (calculated as chloride)

Storage Preserve in tightly closed containers, stored in room temperature and protected from light.

Compound Zedoary Turmeric Oil

Suppositories

It contains not less than 90.0% and not more than 110.0% of the labelled amount of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$).

Formula	Econazole nitrate	50 g
	Z d y i i	21
	Excipients	a quantity

to make 1000 suppositories

Description Creamy yellow to pale yellowish-brown suppositories, special odour.

Identification To one suppository, add 30 ml of ethylene glycol, slightly warm on a water bath to dissolve zedoary turmeric, allow to cool until the matrix precipitate completely and filter. The filtrate complies with the follow tests;

- (1) To 1 ml, add a few drops of trinitrophenol TS, a yellowish-white precipitate is formed.
- (2) Vaporize the ethylene glycol of 2 ml of filtrate under the infrared light. To the residue add 2 drops of sulfuric acid and 1 drop of diphenylamine TS, a deep blue is produced.

Zedoary turmeric oil Transfer one suppository in a conical flask with stopper, accurately add 25 ml of anhydrous ethanol, slightly warm on a water bath to dissolve the matrix, allow to cool, place on an ice bath until the matrix precipitate, filter, taking the filtrate as test solution. Weigh accurately a quantity of Curcumenol CRS, dissolve in anhydrous ethanol to produce a solution of 1 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B). Apply 10 μ l each of above two solutions to the same high performance silica gel G plate separately, using the upper layer of a mixture of benzene-methanol-acetic acid (7.9 : 1.4 : 0.7) as the mobile phase, after developing and removal of the plate, dry it in air, stand in the iodine vapour. The position of the principal spot obtained with the test solution corresponds to the principal spot obtained with the reference solution, and the colour of the principal spot obtained with the test solution is equal to or more intense than that of the principal spot obtained with the reference solution.

Other requirements Comply with the general requirements for Suppositories (Appendix I D).

Assay Weigh accurately 10 suppositories, cut in chips, and mix well. Weigh accurately a quantity of the chips, equivalent to about 40 mg of econazole nitrate, in an iodine flask. Add 40 ml of trichloromethane with shaking, add 20 ml of water, 5 ml of dilute sulfuric acid and 1 ml of dimethyl yellow-solvent blue 19 IS, titrate with dioctyl sodium sulfosuccinate TS with continuously shaking until the colour of the layer of trichloromethane changes from green to reddish-grey. Repeat the operation, using about 40 mg of econazole nitrate CRS instead of the substance being examined, calculate the content with respect to the ratio of volume of dioctyl sodium sulfosuccinate TS consumed.

Category Medicine for gynecology.

Strength 50 mg

Storage Preserve in well closed containers, stored in a cool place.

Cortisone Acetate

$C_{23}H_{30}O_6$ 402.49

[50-04-4]

Cortisone Acetate is 17α , 21-dihydroxypregn-4-ene-3,11,20-trione-21-acetate. It contains not less than 97.0% and not more than 103.0% of $C_{23}H_{30}O_6$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; tasteless at first but a bitter taste persists subsequently.

Freely soluble in chloroform; sparingly soluble in acetone or dioxane; slightly soluble in ethanol or ether; insoluble in water.

Specific optical rotation $+210^\circ$ to $+217^\circ$, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 μ g per ml, in dehydrated ethanol at 238 nm (Appendix IV A), the value of A (1%, 1 cm) is 375-405.

Identification (1) Dissolve 0.1 mg in 1 ml of methanol, add 8 ml of freshly prepared phenylhydrazine sulfate TS, heat at 70°C for 15 minutes; a yellow colour is produced.

(2) Dissolve about 2 mg in 2 ml of sulfuric acid, allow to stand for 5 minutes; a yellow or slightly orange colour is produced, which fades on diluting with 10 ml of water and the solution is clear.

(3) The retention time of principal peak in the chromatogram of the substance being examined, obtained in the Assay, is identical with that of principal peak in the chromatogram of the reference solution.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cortisone acetate (Appendix XVI).

Related substances Carry out the method as described under the Assay. Dissolve a quantity of the substance being examined in acetonitrile to produce a solution of about 1 mg per ml (1). Measure accurately 1 ml of solution (1) into a 100 ml volumetric flask and dilute with acetonitrile to the volume, shake well as solution (2). Inject 20 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 50% of full scale of the chart. Then inject separately 20 μ l of solution (1) and (2) into the column, and record the chromatogram for 2.5 times of the retention time of the principal peak. If there are any other peaks than the principal peak in the chromatogram of solution (1), the area of any one is not greater than 1/2 of area of the principal peak of solution (2), the sum of the areas of all peaks other than the principal peak is not greater than 1.5 times of area of the principal peak area of solution (2).

Loss on drying When dried to constant weight at 105°C , loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of

acetonitrile-water (36 : 64) as the mobile phase. Detective Wavelength is 254 nm. Dissolve a quantity of cortisone acetate CRS and hydrocortisone acetate CRS in acetonitrile to produce a solution including cortisone acetate and hydrocortisone acetate each 10 µg per ml and test. The resolution factor between the peaks of cortisone acetate and hydrocortisone acetate is not less than 4.0.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in acetonitrile to produce a solution of about 0.5 mg per ml, inject 10 µl into the column and record the chromatogram. Repeat the operations using cortisone acetate CRS instead of the substance being examined, calculate the content of $C_{22}H_{29}FO_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Cortisone Acetate Eye Ointment
(2) Cortisone Acetate Injection
(3) Cortisone Acetate Tablets

Cortisone Acetate Eye Ointment

Cortisone Acetate Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of Cortisone Acetate ($C_{23}H_{30}O_6$).

Description A pale yellow eye ointment.

Identification To 1 g add 20 ml of petroleum ether in a conical flask with stopper, shake thoroughly to dissolve the ointment base and filter. Wash the residue with petroleum ether for several times. Dissolve the residue of cortisone acetate in 10 ml of dehydrated ethanol by heating and stirring. Allow to cool in ice bath, filter, evaporate the filtrate to dryness on water bath. Dissolve the residue in 2 ml of sulfuric acid, allow to stand for a few minutes; no fluorescence is produced under sun light, but yellow fluorescence is produced under ultraviolet light.

Other requirements Complies with the general requirements of Eye preparations (Appendix I G).

Assay Reference preparation Dissolve with 25 mg of Cortisone acetate CRS in a 100 ml volumetric flask with dehydrated ethanol and dilute to volume, mix well.

Test preparation Dissolve a quantity equivalent to 25 mg of cortisone acetate in a beaker with about 30 ml of dehydrated ethanol, heat in a water bath, shake thoroughly. Allow to cool in ice bath, and filter. Repeat the extraction for 3 times, combine the filtrates into a 100 ml volumetric flask, dilute to volume with dehydrated ethanol and mix well.

Procedure Measure accurately 1 ml each of the above two solutions into two separate test tubes with stopper, add 9 ml of dehydrated ethanol, 1 ml of triphenyltetrazolium chloride TS and 1 ml of tetramethylammonium hydroxide TS to each tube and mix well. Allow to stand at 25°C in the dark for 40 minutes, measure the absorbances (Appendix IV A) at 485 nm and calculate the content of $C_{23}H_{30}O_6$.

Category As described under cortisone acetate.

Strength (1) 0.25% (2) 0.5% (3) 1%

Storage Preserve in tightly closed containers, stored in dry and cool place.

Cortisone Acetate Injection

Cortisone Acetate Injection is a sterile aqueous suspension of cortisone acetate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of Cortisone Acetate ($C_{23}H_{30}O_6$).

Description A suspension of minute granules which deposit on standing, a homogeneous creamy white suspension is obtained on shaking.

Identification (1) Extract 3 ml twice with 10 ml each of chloroform, separate the chloroform layer, filter, evaporate the filtrate to dryness on a water bath; the residue complies with the test (1), (2) for Identification described under Cortisone Acetate.

(2) The retention time of principal peak in the chromatogram of the substance being examined, obtained in the Assay, is identical with that of principal peak in the chromatogram of the reference solution.

pH value 4.5-7.0 (Appendix VI H).

Other requirements Complies with the requirements of injections (Appendix I B).

Assay Carry out the method described under the Assay of Cortisone Acetate. Measure accurately a quantity of the substance being examined which is equivalent to about 50 mg cortisone acetate, dilute with proper quantities of acetonitrile in a 50 ml volumetric flask, shake for 1 hour until cortisone is dissolved and dilute with acetonitrile to volume, mix well and filter. Measure accurately the succeeding filtrate 5 ml and put in a 50 ml volumetric flask, dilute with acetonitrile to volume, shake well. Inject accurately 20 µl into the column and record the chromatogram; Dissolve a quantity of cortisone acetate CRS in acetonitrile to produce a solution of 0.1 mg per ml. Repeat the above operations using cortisone acetate CRS instead of the substance being examined, calculate the content of $C_{22}H_{29}FO_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Cortisone Acetate.

Strength (1) 2 ml : 50 mg (2) 5 ml : 125 mg
(3) 10 ml : 250 mg

Storage Preserve in well closed containers, protected from light.

Cortisone Acetate Tablets

Cortisone Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of cortisone acetate ($C_{23}H_{30}O_6$).

Description White tablets.

Identification To a quantity of powdered tablet equivalent to 60 mg of cortisone acetate add 25 ml of chloroform and allow to stand for 15 minutes with stirring. Filter and evaporate the filtrate to dryness on a water bath, the residue complies with tests (1) and (2) for Identification described under Cortisone Acetate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer a quantity of the powder equivalent to 20 mg of cortisone acetate into a 100 ml volumetric flask, add 75 ml of

dehydrated ethanol, shake constantly for 1 hour until cortisone acetate is dissolved, dilute with dehydrated ethanol to volume and mix well. Filter, transfer 5 ml of the successive filtrate, accurately measured, into another 100 ml volumetric flask, add dehydrated ethanol to volume and mix well, measure the absorbance of the resulting solution at 238 nm (Appendix IV A). Calculate the content of $C_{23}H_{30}O_6$, taking 390 as the value of A (1%, 1 cm).

Category As described under Cortisone Acetate.

Strength (1) 5 mg (2) 25 mg

Storage Preserve in tightly closed containers, protected from light.

Cresol

C_7H_8O 108.14

[1319-77-3]

Cresol is a mixture of isomeric cresols obtained by fractional distillation from coal tar.

Description An almost colourless or faintly violetish-red or pale brownish-yellow clear liquid; odour, resembling that of phenol but more tarry. Darken with age or on exposure to light. Saturated water solution exhibits neutral or slightly acid reaction.

Miscible with ethanol, chloroform, ether, glycerin, fatty oils or volatile oils; sparingly soluble in water usually forming a cloudy solution; soluble in alkali hydroxide.

Relative density 1.030-1.050 (Appendix VI A).

Boiling range Carry out the method for determination of boiling range (Appendix VI B); Not less than 85% (ml/ml) distils between 190-205°C.

Identification (1) To the saturated aqueous solution add ferric chloride TS; a transient bluish-violet colour is produced.

(2) To the saturated aqueous solution add bromine TS, a pale yellow flocculent precipitate is formed.

Hydrocarbons Dissolve 1.0 ml in 60 ml of water. Any opalescence produced is not more pronounced than that of a reference suspension [mix 57 ml of water with 1.5 ml of sulfuric acid (0.01 mol/L) VS and 2 ml of barium chloride TS, allow to stand for 5 minutes].

Non-volatile substances Evaporate on a water bath to dryness, then dry to constant weight at 105°C, the residue is not more than 0.1%.

Water Not more than 0.8% (Appendix VIII M, method 2 A).

Category Antiseptic, Disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Saponated Cresol Solution

Crotamiton

$C_{13}H_{17}NO$ 203.28

[483-63-6]

Crotamiton is a mixture of Z and E isomers of N-ethyl-o-crotonotoluidide. It contains not less than 97.0% of $C_{13}H_{17}NO$.

Description A colourless to pale yellow oily liquid; almost odourless; partly or completely solidifies at low temperatures.

Very soluble in ethanol or ether; slightly soluble in water.

Relative density 1.008-1.011 (Appendix VI A).

Refractive index 1.540-1.542 (Appendix IV F).

Identification (1) To about 10 ml of a saturated solution in water add a few drops of potassium permanganate TS; a brown colour is produced and a brown precipitate is formed on standing.

(2) The light absorption of a solution of 10 µg per ml in cyclohexane exhibits a maximum at 242 nm (Appendix IV A).

Z-isomer Dissolve a quantity of crotamiton in chloroform to produce a solution of 1 mg per ml as the test solution and a solution of 50 µg per ml as the reference solution. Carry out the method for gas chromatography (Appendix V E), using a capillary column 30 m long coated with a 0.25 µm film of polyethylene glycol 20 M (PEG-20M) as the stationary phase and maintain the column temperature at 180°C. Inject 2 µl of the reference solution into the column, adjust the sensitivity of the system so that the height of the E-isomer peak obtained in the chromatogram is 5% of the full scale of the recorder. Inject accurately measured 2 ml each of the test solution and the reference solution into the column and record the chromatogram. The elution order is Z-and E-isomer. The area of Z-isomer is not more than 15% of the sum of peak areas of Z-and E-isomer.

Chloride To 1.0 g add 25 ml of ethanol and 5 ml of 20% sodium hydroxide solution, heat under a reflux condenser for 1 hour. Cool, transfer to a separator, shake with 25 ml of ether and 10 ml of water. Allow to stand. Separate the aqueous layer and transfer to a 50 ml Nessler cylinder. Dilute to 25 ml with water, add 5 ml of nitric acid and a quantity of water to produce 50 ml. Add 1.0 ml of silver nitrate TS, mix well. Prepare the reference solution in the same manner using 10 ml of sodium chloride standard solution, adding 5 ml of 20% sodium hydroxide and diluting to 25 ml with water, add 5 ml of nitric acid and a quantity of water to produce 50 ml, add 1.0 ml of silver nitrate TS, mix well. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution (0.010%).

Free amines Dissolve 5.0 g in 70 ml of ether, shake and extract with two 10 ml portions of dilute hydrochloride acid. Wash the combined extracts with two 50 ml portions of ether. Evaporate acid extracts on a water bath to dryness and dry the residue at 105°C. The residue weighs not more than 2.5 mg.

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the determination of nitrogen (Appendix VII D, method 1), using about 0.4 g, accurately weighed. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 20.33 mg of $C_{13}H_{17}NO$.

Category antiscabietic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Crotamiton Cream

Crotamiton Cream

Crotamiton cream contains not less than 90.0% and not more than 110.0% of the labelled amount of $C_{13}H_{17}NO$.

Description A white creamy.

Identification (1) Shake vigorously 0.2 g with 10 ml of hot water to dissolve crotamiton and filter. To the filtrate add a few drops of potassium permanganate TS; a brown colour is produced and a brown precipitate is formed on standing.

(2) To a quantity of the cream equivalent to about 50 mg of crotamiton, add 50 ml of cyclohexane and shake to disperse as test solution (heat on a water bath if necessary). Prepare a reference solution of 1 mg of crotamiton CRS per ml. Carry out the thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and methanol as the mobile phase. Apply separately to the plate 10 μ l each of above two solutions, after developing and removal of the plate, dry it in air and examine under ultra-violet light at 254 nm. The position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot obtained with reference solution.

(3) The light absorption of the solution obtained in Assay exhibits a maximum at 242 nm (Appendix IV A).

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay Transfer an accurately weighed quantity equivalent to about 25 mg of crotamiton to a 50 ml volumetric flask, add a quantity of cyclohexane, heat in a hot water bath, shake to dissolve crotamiton. Allow it to cool to room temperature, dilute with cyclohexane to volume, mix well and allow to stand for 1 hour. Measure accurately 2 ml of the supernatant liquid into a 50 ml volumetric flask, dilute with cyclohexane to volume and mix well. Measure the absorbance of the resulting solution at 242 nm (Appendix IV A). Dissolve an accurately weighed quantity of crotamiton CRS in cyclohexane to produce a solution of 20 μ g per ml, measure the absorbance in the same manner. Calculate the content of $C_{13}H_{17}NO$.

Category As described under Crotamiton.

Strength (1) 10 g : 1 g (2) 30 g : 3 g

Storage Preserve in tightly closed containers, stored in a cool place.

Cyclandelate

$C_{17}H_{24}O_3$ 276.37

[456-59-7]

Cyclandelate is 3,3,5-trimethylcyclohexanol α -phenyl- α -hydroxyacetate. It contains not less than 99.0% of $C_{17}H_{24}O_3$, calculated on the dried basis.

Description A white or almost white amorphous powder; odour, characteristic; taste, bitter. Very soluble in ethanol or acetone; practically insoluble in

water.

Melting range 50-62°C, the melting range is within 7°C (Appendix VI C).

Identification (1) Dissolve about 0.5 g in 5 ml of sodium hydroxide TS and boil for 2 minutes, a camphor-like odour is produced, cool and filter. To 2 ml of filtrate, adjust the pH value with dilute sulfuric acid to pH 4, add 1 ml of potassium permanganate TS and shake, a benzaldehyde odour is produced.

(2) Add 1 drop of cupric sulfate TS to the filtrate obtained in test (1) for Identification and shake, the solution changes to blue colour, gradually turns to deep blue colour on standing.

(3) The light absorption of a solution of 0.5 mg per ml in ethanol, exhibits maxima at 252 nm, 258 nm and 264 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cyclandelate (Appendix XVI).

Acidity Dissolve 1.0 g in 20 ml of neutralized ethanol (neutral to phenolphthalein IS), add a few drops of phenolphthalein IS; not more than 0.35 ml of sodium hydroxide (0.1 mol/L) VS is consumed to change the colour of the solution.

Clarity in ethanol A solution of 1.0 g in 10 ml of ethanol is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Ketone ester Measure the absorbances of the solution obtained in the test (3) for Identification at 254 nm and 264 nm. The ratio of the two absorbances is 1.00-1.17.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Assay To about 1.5 g, accurately weighed, in a conical flask add an accurately measured 25 ml of ethanolic potassium hydroxide (0.5 mol/L) VS, heat on water bath to reflux for 30 minutes. Cool, rinse the reflux condenser with freshly boiled and cooled water, combine the washings into the conical flask. Add a few drops of phenolphthalein IS, titrate with sulfuric acid (0.25 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ethanolic potassium hydroxide (0.5 mol/L) VS is equivalent to 138.2 mg of $C_{17}H_{24}O_3$.

Category Peripheral vasodilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation Cyclandelate Capsules

Cyclandelate Capsules

Cyclandelate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of cyclandelate ($C_{17}H_{24}O_3$).

Identification (1) To a quantity of the contents equivalent to about 0.1 g of cyclandelate add 10 ml of ether, stir to dissolve the cyclandelate and filter. Evaporate the filtrate on water bath to dryness, add 1 ml of sodium hydroxide TS, a camphor-like odour is produced. Cool, add 3 ml of dilute sulfuric acid and 1 ml of 3% potassium permanganate solution, heat to boil, a benzaldehyde odour is produced.

(2) To a quantity of the content equivalent to about 25 mg of

cyclandelate add ethanol to produce a solution of 0.5 mg per ml. filter. The light absorption of the filtrate exhibits three maxima at 252 nm, 258 nm and 264 nm (Appendix IV A).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Stir thoroughly an accurately weighed quantity of the mixed contents obtained in the test for Weight variation equivalent to about 1 g of cyclandelate with ether. Filter, wash the residue with ether in portions, filter, evaporate the combined filtrate and washings on a water bath to dryness. Add an accurately measured 20 ml of ethanolic potassium hydroxide (0.5 mol/L) VS, reflux on a water bath for 1 hour. Cool and rinse the reflux condenser with freshly boiled and cooled water, add a few drops of phenolphthalein IS, titrate with sulfuric acid (0.25 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of ethanolic potassium hydroxide (0.5 mol/L) VS is equivalent to 138.2 mg of $C_{17}H_{24}O_3$.

Category, Storage As described under Cyclandelate.

Strength 0.1 g

Cyclophosphamide

$C_7H_{15}Cl_2N_2O_2P \cdot H_2O$ 279.10 [6055-19-2]
Cyclophosphamide is *N, N*-Bis (2-chloroethyl) tetrahydro-2*H*-1,3,2-oxaza-phosphorin-2-amine-2-oxide, monohydrate. It contains not less than 98.0% of $C_7H_{15}Cl_2N_2O_2P$, calculated on the anhydrous basis.

Description White crystals or a crystalline powder. It liquifies upon loss of its water of crystallization. Freely soluble in ethanol; soluble in water or acetone.

Melting point 48.5-52°C, determined without previous drying (Appendix VI C).

Identification (1) Mix about 0.1 g with 1 g of anhydrous sodium carbonate in a crucible, heat until melted, cool, add 20 ml of water to dissolve, filter. The filtrate, after acidified with nitric acid, yields the reactions characteristic of chlorides and phosphates (Appendix III).

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cyclophosphamide CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cyclophosphamide (Appendix XVI).

Acidity Dissolve 0.20 g in 10 ml of water, pH 4.5-6.5 (Appendix VI H).

Chloride Carry out the limit test for chlorides (Appendix VIII A), using 0.40 g. Any opalescence produced is not more pronounced than that of a reference using 7.2 ml of sodium chloride standard solution (0.018%), perform the comparison immediately.

Water 6.0%-7.0% (Appendix VIII M, method 1 A).

Sterility Dissolve each portion in 10 ml of sterile water, the resulting solutions comply with the test for sterility (Appendix XI H).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (36 : 65) as the mobile phase. Detection wavelength is 195 nm and the number of theoretical plates of the column is not less than 2000, calculate with reference to the peak area of cyclophosphamide. The resolution factor between the peaks of cyclophosphamide and internal standard complies with the related requirements.

Internal standard solution Dissolve 36 mg of ethyl parahydroxybenzoate in 2 ml of ethanol in a 200 ml volumetric flask, dilute with the mobile phase to volume, mix well.

Procedure Weigh accurately about 25 mg into a 50 ml volumetric flask, add 5 ml of the internal standard solution and dilute with the mobile phase to volume, shake well. Inject 20 μ l of the test solution into the column; Repeat the operation using cyclophosphamide CRS instead of the substance being examined, calculate the content of $C_7H_{15}Cl_2N_2O_2P$.

Category Antineoplastic.

Storage Preserve in tightly closed containers (for oral use) or in hermetically sealed containers (for injection), stored at a temperature below 30°C and protected from light.

Preparation (1) Cyclophosphamide for Injection
(2) Cyclophosphamide Tablets

Cyclophosphamide for Injection

Cyclophosphamide for Injection is a sterile preparation of crystalline cyclophosphamide. It contains not less than 95.0% and not more than 105.0% of the labelled amount of cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P \cdot H_2O$), calculated on the basis of the average content.

Description White crystals or a crystalline powder.

Identification Complies with the tests for Identification described under Cyclophosphamide.

Chloride Dissolve the contents of one container in water to produce 10 ml, shake immediately with 10 ml of dilute nitric acid and 1 ml of silver nitrate TS. Perform the comparison immediately, any opalescence produced is not more pronounced than that of a reference using 1.8 ml (for strength 0.1 g) or 3.6 ml (for strength 0.2 g) for sodium chloride standard solution (dilute with water to produce 10 ml, add 10 ml of dilute nitric acid and 1 ml of silver nitrate TS, mix well, allow to stand in dark place for 5 minutes) (0.018%).

Acidity, Water Complies with the corresponding tests described under Cyclophosphamide.

Sterility Dissolve each portion in sterile water separately to produce solutions of 20 mg per ml. The solutions comply with the test for sterility (Appendix XI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cyclophosphamide, using the mixed contents obtained in the test for Weight variation of contents.

Category As described under Cyclophosphamide.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in well closed containers, protected from

light and stored at a temperature below 30°C.

Cyclophosphamide Tablets

Cyclophosphamide Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of cyclophosphamide ($C_7H_{15}Cl_2N_2O_2P \cdot H_2O$).

Description Sugar-coated tablets with white core.

Identification Powder some tablets, with sugar coating removed. Extract a quantity of the powdered tablets equivalent to about 0.2 g of cyclophosphamide with ether, filter, evaporate the filtrate to dryness. The residue complies with the test (1) and (3) for Identification described under Cyclophosphamide.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of cyclophosphamide CRS.

Acidity Shake a quantity of the powdered tablets equivalent to about 0.25 g of cyclophosphamide, with 20 ml of freshly boiled and cooled water, filter. To the filtrate add a few drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS, not more than 0.25 ml of sodium hydroxide (0.1 mol/L) VS is required.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets, with sugar coating removed. To an accurately weighed quantity of the powder equivalent to about 0.1 g of cyclophosphamide in a 100 ml volumetric flask add 50 ml of water with ultrasonic treatment for 10 minutes, dilute with water to volume, shake well and filter. Transfer 25 ml of the successive filtrate into a 50 ml volumetric flask, add 5 ml of the internal standard solution, dilute with the mobile phase to volume, mix well. Carry out the Assay as described under Cyclophosphamide.

Category As described under Cyclophosphamide.

Strength 50 mg

Storage Preserve in tightly closed containers, protected from light and stored at a temperature below 30°C.

Cyclosporin

$C_{62}H_{111}N_{11}O_{12}$ 1202.63

[59865-13-3]

Cyclosporin is *cyclo* [[(E)-(2S,3R,4R)-3-hydroxy-4-methyl-2-(methylamino)oct-6-enoyl]-L-2-amino-butyl-L-N-methylglycyl-L-N-methyl-L-leucyl-L-valyl-L-N-methyl-L-leucyl-L-alanyl-D-alanyl-L-N-methyl-L-leucyl-L-N-methyl-L-leucyl-L-N-methyl-L-valyl]. It contains not less than 98.5% of $C_{62}H_{111}N_{11}O_{12}$, calculated on the dried basis.

Description A white or almost white powder; odourless.

Very soluble in methanol, ethanol or acetonitrile; freely soluble in ethyl acetate; soluble in acetone or ether; practically insoluble in water.

Specific optical rotation -182° to -192° , in a solution of 10 mg per ml in methanol (Appendix V E).

Identification (1) Dissolve about 5 mg in 5 ml of methanol, add a drop of potassium permanganate TS, the purplish-red colour disappears gradually on standing.

(2) The retention time of principal peak of cyclosporin in the substance being examined in the chromatogram obtained in the Assay is identical with that of principal peak of cyclosporin CRS in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cyclosporin (Appendix XVI).

Related substances Dissolve an accurately weighed quantity in a mixture of acetonitrile-water (1 : 1) to produce a test solution of about 1.25 mg per ml. Dissolve an accurately weighed quantity of cyclosporin CRS in above solvent to produce a reference solution of about 12.5 µg per ml. Carry out the method described under Assay. Inject 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of full scale of the chart. Inject separately 20 µl each of the test solution and the reference solution and record the chromatogram for two times of the retention time of principal peak. Calculate the content of each impurity with respect to the peak area obtained in the chromatogram by the external standard method. Any individual impurity is not more than 0.7% and the sum of all such impurities, disregarding the impurities less than 0.05%, is not greater than 1.5%.

Loss on drying When dried in vacuum over phosphorous pentoxide at 60°C for 3 hours, loses not more than 2.0% of its weight (Appendix VIII L), using 0.5 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 0.5 g: not more than 0.002%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel (a 0.25 mm × 1000 mm stainless steel capillary tube is connected to the column head) and a mixture of acetonitrile-water-*tert*-butyl methyl ether-phosphoric acid (430 : 520 : 50 : 1) as the mobile phase. Detection wavelength is 210 nm. The stainless steel capillary tube and the column are maintained at 70°C. The number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of cyclosporin.

Procedure Dissolve an accurately weighed quantity in a mixture of acetonitrile-water (1 : 1) to produce a solution of 1.25 mg per ml. Inject 20 µl into the column, and record the chromatogram. Repeat the operation, using cyclosporin CRS instead of the substance being examined. Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Immunosuppressant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Cyclosporin Oral Solution

Cyclosporin Oral Solution

Cyclosporin Oral Solution contains not less than 90.0% and not more than 110.0% of the labelled amount of cyclosporin ($C_{62}H_{111}N_{11}O_{12}$).

Description A clear, pale yellow or yellow oily liquid.

Identification (1) Carry out the thin-layer chromatography (Appendix V B), using silica gel G as the coating substance. Apply separately to the plate 10 μ l of each of two solutions containing (1) 1 mg of the substance being examined, (2) 1 mg of cyclosporin CRS per ml in a mixture of methanol-chloroform (4 : 1) respectively, develop with ether as the mobile phase first, remove the plate, dry it in air, transfer the plate to another developing chamber and develop with a mixture of ethyl acetate-butanone-water-methanol (60 : 40 : 2 : 1) as the mobile phase, dry it in air, spray with potassium iodobismuthate TS and then with hydrogen peroxide TS. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to that of the principal spot obtained with solution (2).

(2) The retention time of principal peak of cyclosporin in the solution being examined in the chromatogram obtained in the Assay is identical with that of principal peak of cyclosporin CRS in the chromatogram of the reference solution.

Test (1) and (2) are alternative.

Alcohol content Not less than 10% and not more than 15% (Appendix VII E), using butyl alcohol as solvent for the preparation of reference solution and test solution.

Other requirements Complies with the general requirements for oral solution (Appendix I O).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water-phosphoric acid (740 : 260 : 0.25) as the mobile phase. Detection wavelength is 210 nm, and the column is maintained at 70°C. The resolution between the peak of cyclosporin and neighboring peak complies with the requirements. The number of theoretical plates of the column is not less than 600, calculated with reference to the peak of cyclosporin.

Procedure Dissolve an accurately weighed quantity in a mixture of methanol-chloroform (4 : 1) to produce a solution of 1 mg per ml. Inject 20 μ l into the column and record the chromatogram. Repeat the operation, using cyclosporin CRS instead of the substance being examined. Calculate the content of $C_{62}H_{111}N_{11}O_{12}$ with respect to the peak area obtained in the chromatogram by the external standard method, converted by relative density.

Category As described under Cyclosporin.

Strength 50 ml : 5 g

Storage Preserve in tightly closed containers, store in a cool and dark place, protected from light.

Cydiodine Buccal Tablets

Cydiodine Buccal Tablets are tablets of iodine encapsulated with β -cyclodextrin. It contains not less than 85.0% and not more than 115.0% of the labelled amount of iodine (I).

Description Pale brown-yellow tablets.

Identification (1) Powder finely 2 tablets, in a conical flask. Dissolve iodine with 10 ml of water. Add 2 ml of starch IS, a blue colour is produced. The colour disappears when the solution is boiled and reappears on cooling, but does not reappear when boiled for a long time.

(2) Powder finely 2 tablets, in a test tube with stopper. Add 3 ml of ethanol, heat in warm water bath for about 5 minutes. Add 3 ml of water and 1 ml of chloroform. Close and shake, a purple colour is produced in chloroform layer.

Content uniformity Comply with the requirements for content uniformity (Appendix X E) except the limit is $\pm 20\%$. Place 1 tablet in a conical flask with stopper. Add 0.3 g of potassium iodide, 100 ml of water and 6 ml of 10% acetic acid solution. Carry out the procedure as described under the Assay beginning at the words "shake to dissolve I". Calculate the content of I.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of powder equivalent to about 10 mg of I, into a conical flask with stopper. Add 0.3 g of potassium iodide, 150 ml of water and 10 ml of 10% acetic acid solution, shake to dissolve I. Add accurately 10 ml of sodium thioacetamide (0.01 mol/L) VS, mix well. Stand for 10 minutes closely in dark. Adding 2 ml of starch IS, titrate with iodine (0.005 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of sodium thioacetamide (0.01 mol/L) VS is equivalent to 1.269 mg of I.

Category Antiseptics.

Strength 1.5 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Cyproheptadine Hydrochloride

$C_{21}H_{21}N \cdot HCl \cdot 1\frac{1}{2}H_2O$ 350.89 [41354-29-4]

Cyproheptadine Hydrochloride is 4-(5H-dibenzo [a, d] cyclohept-5-ylidene)-1 methyl-piperidine hydrochloride sesquihydrate. It contains not less than 98.5% of $C_{21}H_{21}N \cdot HCl$, calculated on the dried basis.

Description A white to slightly yellow crystalline powder; almost odourless; taste, slightly bitter.

Freely soluble in methanol; soluble in chloroform; sparingly soluble in ethanol; slightly soluble in water; practically insoluble in ether.

Identification (1) The light absorption of a 16 μ g per ml solution in dehydrated ethanol exhibits a maximum at 286 nm and a minimum at 264 nm (Appendix IV A). The ratio of

the absorbance at 286 nm to that at 264 nm is 1.6-1.8.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cyproheptadine hydrochloride (Appendix XVI).

(3) The saturated aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Shake thoroughly 1.0 g in 25 ml of water, add 1 drop of methyl red IS, titrate with sodium hydroxide (0.1 mol/L) VS, until the solution changes to yellow. The volume of sodium hydroxide (0.1 mol/L) VS consumed is not more than 0.15 ml.

Loss on drying When dried to constant weight at 100°C under a pressure not exceeding 0.7 kPa over phosphorous pentoxide, loses not less than 7.0% and not more than 9.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.3 g, dried previously and accurately weighed, in 10 ml of glacial acetic acid by warming gently and cool. Add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the solution changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 32.39 mg of $C_{21}H_{21}N \cdot HCl$.

Category Antihistamine.

Storage Preserve in tightly closed containers, protected from light.

Preparation Cyproheptadine Hydrochloride Tablets

Cyproheptadine Hydrochloride Tablets

Cyproheptadine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of cyproheptadine hydrochloride ($C_{21}H_{21}N \cdot HCl$).

Description White tablets.

Identification (1) The solution obtained in the Assay complies with test (1) for Identification described under Cyproheptadine Hydrochloride.

(2) Dissolve a quantity of the powdered tablets equivalent to about 20 mg of anhydrous cyproheptadine hydrochloride in 7 ml of water, shake thoroughly and filter. The filtrate yields the reactions characteristic of chlorides (Appendix III).

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Shake 1 tablet with 20 ml of hydrochloric acid solution (9 → 50) in a 100 ml volumetric flask and allow to disintegrate. Proceed as described under Assay, beginning at the words "add about 50 ml of dehydrated ethanol...".

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 150 ml of 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw the solution after exactly 45 minutes and filter, take the successive filtrate as the test solution. Dissolve about 13 mg of cyproheptadine

hydrochloride CRS, accurately weighed, with ethanol in a 100 ml volumetric flask and shake until cyproheptadine hydrochloride CRS is dissolved, then dilute with ethanol to volume, mix well. Measure accurately 5 ml of the solution in a 50 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well as the reference solution. Measure the absorbance of the test and the reference solution at 285 nm, calculate the dissolution of $C_{22}H_{29}FO_5$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Transfer an accurately weighed quantity equivalent to about 1.5 mg of anhydrous cyproheptadine hydrochloride to a 100 ml volumetric flask. Add 2.0 ml of hydrochloric acid solution (9 → 50), shake for 2-3 minutes, then add about 50 ml of dehydrate ethanol and shake for 10 minutes to dissolve cyproheptadine hydrochloride. Dilute with dehydrated ethanol to volume, mix well and centrifuge. Measure the absorbance of the supernatant solution at 286 nm (Appendix IV A). Calculate the content of $C_{21}H_{21}N \cdot HCl$, taking 353 as the value of A (1%, 1 cm).

Category As described under Cyproheptadine Hydrochloride.

Strength 2 mg (calculated as $C_{21}H_{21}N \cdot HCl$)

Storage Preserve in tightly closed containers, protected from light.

Cystine

$C_6H_{12}N_2O_4S_2$ 240.30

Cystine is (R, R)-3,3'-dithiobis (2-amino-propanoic acid). It contains not less than 98.5% of $C_6H_{12}N_2O_4S_2$, calculated on the dried basis.

Description White crystals or crystalline powder.

Practically insoluble in water and in ethanol, soluble in dilute hydrochloric acid or in sodium hydroxide TS.

Specific optical rotation -215° to -230° , in a solution of 20 mg per ml in 1 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cystine (Appendix XVI).

Acidity To 1.0 g add 100 ml of water, shake thoroughly, pH is 5.0-6.5 (Appendix VI H).

Transmittance of solution Dissolve 1.0 g in 20 ml of 1 mol/L hydrochloric acid solution, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chloride Dissolve 0.25 g in 5 ml of dilute nitric acid, add sufficient water to produce 25 ml. Carry out the limit test for chloride (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Dissolve 0.70 g in 5 ml of dilute hydrochloric acid by shaking, add sufficient water to produce 40 ml. Carry

out the limit test for sulfate (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference solution using 1.4 ml of potassium sulfate standard solution and 5 ml of dilute hydrochloric acid (0.02%).

Other amino acids Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-water-glacial acetic acid (5 : 2 : 1) as the mobile phase. Apply separately to the plate 2 μ l of a solution of 10 mg per ml in 1 mol/L hydrochloric acid solution. After developing and removal of the plate, dry it in air and spray with ninhydrin solution (dissolve 1 g ninhydrin in 50 ml of acetone) and heat at 80°C until the colour is produced and examine immediately. No spot other than the principal spot in the chromatogram is observed.

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.2% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron To the residue obtained in the test for Residue on ignition add 1 ml of nitric acid, evaporate to dryness on a water bath, add 4 ml of dilute hydrochloric acid, warm to effect dissolution, transfer the solution to a 50 ml of Nessler cylinders. Carry out the limit test for iron (Appendix VIII G). Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g; not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Assay Weigh accurately about 15 mg. Carry out the method for determination of nitrogen (Appendix VII D, method 2). Each ml of sulfuric acid (0.005 mol/L) VS is equivalent to 1.2015 mg of $C_3H_7NO_2S$.

Category Amino acid.

Storage Preserve in tightly closed containers, protected from light.

Cysteine Hydrochloride

$C_3H_7NO_2S \cdot HCl \cdot H_2O$ 175.64

Cysteine Hydrochloride is (L)-2-amino-3-mercaptopropanoic acid hydrochloride monohydrate. It contains not less than 98.5% of $C_3H_7NO_2S \cdot HCl$, calculated on the dried basis.

Description White crystals or crystalline powder; odorous; taste, sour. Freely soluble in water; sparingly soluble in ethanol; practically insoluble in acetone.

Specific optical rotation +5.5° to +7.0°, in a solution of 80 mg per ml in 1 mol/L hydrochloric acid solution (Appendix VI E).

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Cysteine hydrochloride (Appendix XVI).

Acidity Dissolve 0.20 g in 20 ml of water, pH 1.5-2.0 (Appendix VI H).

Transmittance of solution Dissolve 0.5 g in 10 ml of water, the transmittance at 430 nm is not less than 98.0% (Appendix IV A).

Chlorine content Dissolve about 0.25 g, accurately weighed, in 10 ml of water and 10 ml of nitric acid solution (1→2), add accurately 25 ml of silver nitrate VS (0.1 mol/L) and 50 ml of a 1% solution of potassium permanganate measured, heat in a water bath for 30 minutes, cool, add 30% solution of hydrogen peroxide until the colour of solution disappear. Add 8 ml of ammonium ferric sulfate IS and 1 ml of nitro-benzene, titrate with ammonium thiocyanate (0.1 mol/L) VS, perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 3.545 mg of chlorine. It contains not less than 19.8% and not more than 20.8% of chlorine.

Sulfate Carry out the limit test for sulfate (Appendix VIII B), using 0.7 g. Any opalescence produced is not more pronounced than that of a reference solution using 1.4 ml of potassium sulfate standard solution (0.02%).

Other amino acids Dissolve an accurately weighed quantity of substance being examined in 2% *N*-ethylmaleimide solution to produce a solution of 4 mg per ml as a test solution. Dissolve 10 mg of cystine CRS, accurately weighed, in 3 ml of 0.1 mol/L hydrochloric acid solution, ultrasonicate, add a quantity of water to dissolve, and dilute with water to 100 ml, mix well. To an accurately measured 1.0 ml of the solution add 4 ml of 2% *N*-ethylmaleimide solution, mix well, as a reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and *n*-butanol-glacial acetic acid-water (5 : 1 : 2) as the mobile phase. Apply separately to the plate 5 μ l of each of above two solutions. After developing and removal of the plate, dry it in air and spray with ninhydrin solution (dissolve 1 g ninhydrin in 50 ml of acetone) and heat at 80°C until the colour is produced and examine immediately. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the principal spot obtained with the reference solution (0.5%).

Loss on drying When dried in vacuum over phosphorous pentoxide for 24 hours, loses not less than 8.0% and not more than 12.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron Carry out the limit test for iron (Appendix VIII G), using 1.0 g. Any colour produced is not more intense than that of a reference solution using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 1), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Arsenic Dissolve 2.0 g in 23 ml of water, add 5 ml of hydrochloric acid, carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0001%.

Pyrogens Complies with the test for pyrogens (Appendix XI D), using 10 ml of a solution of 15 mg per ml in Sodium Chloride Injection per kg of the rabbit's weight.

Assay Weigh accurately about 0.25 g in an iodine flask. Add 20 ml of water and 4 g of potassium iodide to dissolve by shaking, add 5 ml of dilute hydrochloric acid solution and 25.0 ml of iodine (0.05 mol/L) VS, allow to stand in the dark for 15 minutes, cool the solution in an ice bath for 5

minutes. Titrate with sodium thiosulfate (0.1 mol/L) VS, using 2 ml of starch IS added toward the end of titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 15.76 mg of $C_9H_7NO_2S \cdot HCl$.

Category Amino acid.

Storage Preserve in tightly closed containers, stored in a cool and dry place and protected from light.

Cytarabine Hydrochloride

$C_9H_{13}N_3O_5 \cdot HCl$ 279.68

[69-74-9]

Cytarabine Hydrochloride is 4-amino-1- β -D-arabinofuranosyl-2 (1H)-pyrimidinone monohydrochloride. It contains not less than 97.0% and not more than 103.0% of $C_9H_{13}N_3O_5 \cdot HCl$, calculated on the dried basis.

Description White, fine needle crystals or crystalline powder.

Very soluble in water; sparingly soluble in ethanol; practically insoluble in ether.

Melting range 189-195°C, with decomposition (Appendix VI C).

Specific optical rotation +127° to +133°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The light absorption of the solution obtained in the Assay exhibits a maximum at 280 nm and a minimum at 241 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of cytarabine hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reaction characteristic of chlorides (Appendix III).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Dissolve a quantity, accurately weighed, in hydrochloric acid solution (9→1000) to produce a solution of 10 μ g per ml, measure the absorbance at 280 nm (Appendix IV A). Calculate the content of $C_9H_{13}N_3O_5 \cdot HCl$, taking 484 as the value of A (1%, 1 cm).

Category Antineoplastic.

Storage Preserve in tightly closed containers, protected from light and stored in a cold place.

Preparation Cytarabine Hydrochloride for Injection

Cytarabine Hydrochloride for Injection

Cytarabine Hydrochloride for Injection is a

lyophilized sterile powder. It contains not less than 93.0% and not more than 107.0% of the labelled amount of cytarabine hydrochloride ($C_9H_{13}N_3O_5 \cdot HCl$).

Description A white, lyophilized mass or powder.

Identification Complies with the tests (1) and (3) for Identification described under Cytarabine Hydrochloride.

Acidity An aqueous solution of 10 mg per ml, pH 4.0-6.0 (Appendix VI H).

Loss on drying When dried to constant weight in vacuum over phosphorous pentoxide, loses not more than 3.0% of its weight (Appendix VIII L).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dissolve the contents of 10 vials, separately, in hydrochloric acid solution (9→1000) to produce a solution of 10 μ g per ml. Measure the absorbance of each solution at 280 nm (Appendix IV A). Calculate the content of $C_9H_{13}N_3O_5 \cdot HCl$ in each vial, taking 484 as the value of A (1%, 1 cm), and calculate the average content of 10 vials.

Category As described under Cytarabine Hydrochloride.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in well closed containers, protected from light and stored in a cold place.

Cytochrome C for Injection

Cytochrome C for Injection is a sterile lyophilized product of cytochrome C with the addition of suitable excipient and antioxidant. It contains not less than 90.0% and not more than 115.0% of the labelled amount of cytochrome C.

Description A pink, lyophilized mass. Freely soluble in water.

Identification (1) Dissolve the contents of one container in 5 ml of water. Complies with test (1) for Identification described under Cytochrome C Solution, using 1 ml.

(2) Complies with test (2) for Identification described under Cytochrome C solution, using the remaining solution obtained in the Assay.

Acidity or Alkalinity Dissolve a quantity in Water for Injection to produce a solution of 3 mg per ml, pH 6.0-7.5 (Appendix VI H).

Sterility Complies with the test for sterility (Appendix XI H), using 2 containers. Dissolve the contents of each container in Sodium Chloride Injection to produce a solution of 1.5 mg per ml.

Bacterial endotoxin and allergen Complies with the tests for pyrogens and allergen described under Cytochrome C Solution.

Activity Carry out the Determination of Cytochrome C Activity (Appendix XIII B), not less than 90.0%.

Other requirements Complies with the general requirements for injections (Appendix I B) except the test for weight variation of contents.

Assay Dissolve the contents of three containers separately in a quantity of phosphate BS described under Cytochrome C Solution, transfer to three 100 ml volumetric flasks

respectively, and dilute to volume with the same solvent. Complete the Assay described under the Cytochrome C Solution beginning at the words "add 15 mg of sodium hydrosulfite". Repeat the assay if the content of one container fails to comply with the requirement.

Category As described under Cytochrome C Solution.

Strength 15 mg

Storage Preserve in well closed containers, stored in a cool place, protected from light.

Cytochrome C Injection

Cytochrome C Injection is a sterile solution of cytochrome C in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of cytochrome C.

An equal quantity of glycyl glycine is added as stabilizer and a quantity of sodium bisulfite and sodium sulfite as antioxidant.

Description A clear, orange-red liquid.

Identification (1) Complies with test (1) for Identification described under Cytochrome C solution, using 1 ml.

(2) Complies with test (2) for Identification described under Cytochrome C solution, using the remaining solution obtained in the Assay.

pH value 6.0-7.5 (Appendix VI H).

Bacterial endotoxin and allergen Complies with the tests for pyrogens and allergen described under Cytochrome C solution.

Activity Carry out the Determination of Cytochrome C Activity (Appendix XIII B), not less than 90.0%

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Cytochrome C solution, beginning at the words "in a 50 ml volumetric flask...", using 1 ml, accurately measured.

Category As described under Cytochrome C solution.

Strength 2 ml : 15 mg

Storage Preserve in well closed containers, protected from light and stored in a cool place.

Cytochrome C Solution

Cytochrome C solution is the solution of cytochrome C extracted from pig or bovine hearts. It contains not less than 15 mg of cytochrome C per ml. A quantity of antimicrobial preservative may be added.

Description A clear, deep red liquid.

Identification (1) To 1 ml of the test preparation obtained under the test for iron content add dropwise 20% trichloroacetic acid solution, a brown or brownish-red flocculent precipitate is produced and the red colour of the solution disappears. The precipitate can be dissolved in water, and the solution exhibits a brownish-red colour.

(2) Dilute 1 ml of the test preparation obtained under the

test for iron content in a 50 ml volumetric flask with phosphate BS (Dissolve 1.38 g of sodium dihydrogen phosphate and 31.2 g of disodium hydrogen phosphate in water to produce 1000 ml, adjust the pH value to 7.3) to volume, add about 15 mg of sodium hydrosulfite, shake thoroughly. The light absorption of the solution exhibits maxima at 520 nm and 550 nm, and a minimum at 535 nm (Appendix IV A).

Iron content *Standard iron preparation* Dissolve 50 g of ammonium ferric sulfate in a mixture of 300 ml of water and 6 ml of sulfuric acid, add a quantity of water to produce 1000 ml, mix well. Measure accurately 25 ml to an iodine flask, add 5 ml of hydrochloric acid, mix well, add 12 ml of potassium iodide TS, stopper the flask, allow to stand for 10 minutes. Titrate the iodine with sodium thiosulfate (0.1 mol/L) VS, add 1 ml of starch IS towards the end of titration, continue the titration until the blue colour disappears. Each ml of sodium thiosulfate (0.1 mol/L) VS is equivalent to 5.585 mg of iron. Calculate the iron content (mg) per ml according to the consumed volume of sodium thiosulfate (0.1 mol/L) VS. Mix an accurately measured quantity with dilute sulfuric acid solution (dilute 2 ml of dilute sulfuric acid TS with water to produce 500 ml), to produce a solution of 23 µg of Fe per ml.

Test preparation Dilute a quantity, accurately measured, equivalent to about 100 mg of cytochrome C in a 10 ml volumetric flask to volume with water.

Procedure Evaporate 5 ml of test preparation, accurately measured, in a crucible previously ignited to constant weight, to dryness, dry to constant weight at 105°C and weigh accurately as W_1 . Ignited gently to carbonize completely, continue the ignition at 500 to 600°C until incineration is complete, weigh accurately as W_2 . Transfer 1 ml of test preparation, accurately measured, to a 25 ml volumetric flask, add 0.7 ml of 30% hydrogen peroxide solution and 0.5 ml of dilute sulfuric acid TS, heat in a water bath for 30 minutes, allow to cool. Add accurately 2 ml of 2,2'-dipyridyl TS, allow to stand in a cool water bath, add 5 ml of sodium sulfite TS slowly with shaking, then heat in a water bath at 60-70°C for 30 minutes, cool to room temperature, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 522 nm (Appendix IV A) as A_1 ; measure accurately 2 ml of standard iron solution to a 25 ml volumetric flask and proceed in the same manner beginning at the words "add 0.7 ml of 30% hydrogen peroxide solution", measure the absorbance as A_2 . It contains not less than 0.40% and not more than 0.46% of iron calculated with the following expression:

$$\text{Content of Iron} = \frac{A_1 \times 23}{A_2 (W_1 - W_2)} \%$$

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E): Less than 5 EU per mg of cytochrome C.

Allergen Dilute a quantity with sterile Water for Injection to produce a solution of 7.5 mg of cytochrome C per ml. Inject 0.5 ml of the diluted solution into abdominal cavity of each of 6 health guinea pigs weighing 250-350 g for 3 times successively, once every other day; and 1 ml of test preparation into femoral (auricular) vein after two weeks. None of the guinea pigs shows two or more than two types of allergic reactions within 15 minutes, such as hair pricking, short of breathing, sneezing, retching or continuous cough for three times; or one of the following allergic reactions: raleing, twitching, collapsing or dying.

Activity Carry out the Determination of Cytochrome C Activity (Appendix XIII B), not less than 95.0%.

Assay Dilute 1 ml of the test preparation, accurately measured, obtained in the test for Iron content in a 50 ml volumetric flask to volume with phosphate BS described in Identification test (2), add 15 mg of sodium hydrosulfite, shake thoroughly. Measure the absorbance at the maximum wave length found at intervals of 10 nm in the vicinity of 550 nm (Appendix IV A), calculate the content of cytochrome C, taking 23.0 as the value of A (1%, 1 cm).

Category Cell respiration activator.

Storage Preserve in tightly closed containers, stored at a temperature below 4°C.

Preparation (1) Cytochrome C for Injection
(2) Cytochrome C Injection

Dactinomycin

$C_{62}H_{86}N_{12}O_{16}$ 1255.44

[50-76-0]

Dactinomycin contains not less than 95.0% of $C_{62}H_{86}N_{12}O_{16}$, calculated on the dried basis.

Description Bright red or deep red crystals, or an orang-red crystalline powder; odourless; hygroscopic; very unstable on exposure to light. The solution in ethanol is levorotatory. Freely soluble in acetone, chloroform or isopropanol; sparingly soluble in methanol; slightly soluble in ethanol; practically insoluble in water, but soluble in water at 10°C.

Specific optical rotation -292° to -317° , in a solution of 1 mg per ml in methanol.

Identification (1) The light absorption of the solution obtained in the Assay (Appendix IV A) exhibits two maxima at $241\text{ nm} \pm 2\text{ nm}$ and $442\text{ nm} \pm 2\text{ nm}$. The ratio of the absorbance at 241 nm to that at 442 nm is 1.3-1.5.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dactinomycin (Appendix XVI).

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 5.0% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E). It contains less than 100 EU per mg.

Sterility Complies with the test for sterility (Appendix XI H, membrane filtration method), using no less than 500 ml of 0.9% sterile sodium chloride solution.

Assay Dissolve an accurately weighed quantity in methanol to produce a solution of 20 μg per ml, measure the absorbance at $442\text{ nm} \pm 2\text{ nm}$ (Appendix IV A). Calculate the content of $C_{62}H_{86}N_{12}O_{16}$, taking 202 as the value of A (1%, 1 cm).

Category Antineoplastic antibiotic.

Storage Preserve in hermetically sealed containers, protected from light and stored in a dry place.

Preparation Dactinomycin for Injection

Dactinomycin for Injection

Dactinomycin for Injection is a sterile mixture of dactinomycin and sucrose. It contains not less than 93.0% and not more than 107.0% of the labelled amount of dactinomycin ($C_{62}H_{86}N_{12}O_{16}$), calculated on the basis of the average content in each

container.

Description A pale orang-red crystalline powder; unstable on exposure to light.

Identification Complies with the test (1) for Identification described under Dactinomycin in a solution of 0.03 mg per ml in methanol.

Acidity or alkalinity Dissolve the contents of one container in 5 ml of water, pH 5.5-7.5 (Appendix VI H).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 1.0% of its weight (Appendix VIII L).

Content uniformity Complies with the requirements for content uniformity, using the content of each container obtained under Assay (Appendix X E).

Bacterial endotoxin Complies with the requirements described under Dactinomycin.

Sterility Complies with the test for sterility described under Dactinomycin, using six containers.

Other requirements Complies with the general requirements for injections (Appendix I B), except the test for weight variation of contents.

Assay Dissolve the contents of ten containers separately in methanol, transfer to 10 ml volumetric flasks and dilute with methanol to volume, shake thoroughly and allow to stand. Measure the absorbance of the supernatant liquid at $442\text{ nm} \pm 2\text{ nm}$ (Appendix IV A), calculate the content of $\text{C}_{62}\text{H}_{86}\text{N}_{12}\text{O}_{16}$ in each container, taking 202 as the value of A (1%, 1 cm), and calculate the average content of ten containers.

Category As described under Dactinomycin.

Strength 0.2 mg (calculated as $\text{C}_{62}\text{H}_{86}\text{N}_{12}\text{O}_{16}$)

Storage Preserve in well closed containers and protected from light.

Danazol

$\text{C}_{22}\text{H}_{27}\text{NO}_2$ 337.46

[17230-88-5]

Danazol is 17 α -pregna-2,4-dien-20-yno [2,3-*d*] isoxazol-17 β -ol. It contains not less than 97.0% and not more than 103.0% of $\text{C}_{22}\text{H}_{27}\text{NO}_2$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder.

Freely soluble in chloroform; soluble in acetone; sparingly soluble in ethanol; insoluble in water.

Melting range 223-230°C, with decomposition (Appendix VI C).

Specific optical rotation +21° to +27°, in a solution of about 10 mg per ml in chloroform (Appendix VI E).

Identification (1) Dissolve about 2 mg in 5 ml of ethanol, add 2 drops of silver nitrate TS, a white precipitate is produced.

(2) The retention time of principal peak in the chromatogram of the substance being examined, obtained in the Assay, is identical with that of principal peak in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of danazol (Appendix VI).

Loss on drying When dried to constant weight in vacuum at 60°C, loses not more than 1.0% of its weight (Appendix VIII L).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of cyclohexane-ethyl acetate (7:3) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in chloroform-methanol (9:1) containing (1) 10 mg, (2) 0.20 mg of the substance being examined per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light at 254 nm. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsiane bonded silica gel and a mixture of acetonitrile-methanol-water (4:4:3) as the mobile phase. Detection wavelength is 270 nm, and the number of theoretical plates of the column is not less than 2500, calculated with reference of the peak of danazol.

Procedure Dissolve a quantity, accurately weighed, in the mobile phase to produce a solution of 0.2 mg per ml, inject accurately 10 μ l of the solution into the column and record the chromatogram. Repeat the operation using the danazol CRS instead of the substance being examined, calculate the content of $\text{C}_{22}\text{H}_{27}\text{NO}_2$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Gonadotrophin inhibitor.

Storage Preserve in tightly closed containers, protected from light.

Preparation Danazol Capsules

Danazol Capsules

Danazol Capsules contain not less than 90.0% and not more than 110.0% of anhydrous danazol ($\text{C}_{22}\text{H}_{27}\text{NO}_2$).

Identification (1) Extract a quantity of the contents of the capsules with chloroform, filter and evaporate the filtrate to dryness. The residue complies with the tests for Identification described under Danazol.

(2) The light absorption of the solution of the substance being examined exhibits a maximum at 285 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 1000 ml of hydrochloric acid (0.1 mol/L)-isopropanol (3:2) as the dissolution medium, the rotational speed of the paddle is adjusted to 80 rpm. Withdraw 25 ml of the solution after exactly 30 minutes and filter. Discard the initial filtrate, accurately measure a quantity of the successive filtrate, dilute with dissolution medium to produce a solution of 20 μ g per ml. Measure the absorbance at 286 nm (Appendix IV A), using a 20 μ g per ml solution of danazol CRS in the same solvent as reference. Calculate the dissolution of $\text{C}_{22}\text{H}_{27}\text{NO}_2$ from each capsule.

not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Mix the contents obtained in the test for weight variation. Transfer an accurately weighed quantity equivalent to about 30 mg of danazol to a 100 ml volumetric flask, add 50 ml of dehydrated ethanol, heat in a warm water bath for 10 minutes with shaking. Cool to room temperature, dilute with dehydrated ethanol to volume and mix well. Filter, transfer 5 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask and dilute with dehydrated ethanol to volume, shake well as the test solution. Dissolve a quantity of danazol CRS, accurately weighed, in anhydrous ethanol to produce a solution of about 15 µg per ml as the reference solution. Measure the absorbance of the two solutions above at 285 nm (Appendix IV A) and calculate the content of $C_{22}H_{27}NO_2$.

Category As described under Danazol.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Dapsone

$C_{12}H_{12}N_2O_2S$ 248.31

[80-08-0]

Dapsone is 4,4'-sulfonylbisbenzenamine. It contains not less than 99.0% of $C_{12}H_{12}N_2O_2S$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; taste, slightly bitter. Freely soluble in acetone; soluble in methanol; sparingly soluble in ethanol; practically insoluble in water; but soluble in dilute hydrochloric acid.

Melting range 176-181°C (Appendix VI C).

Identification (1) The light absorption of a solution of 5 µg per ml in methanol exhibits maxima at 261 nm and 296 nm; the absorbance is about 0.35-0.38 and 0.59-0.62, respectively (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dapsone (Appendix XVI).

(3) Yields the reactions characteristic of primary aromatic amines (Appendix III).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-acetone (2:1) as the mobile phase. Apply separately to the plate 10 µl each of three solutions in methanol containing (1) 10 mg, (2) 100 µg and (3) 20 µg of the substance being examined per ml. After developing and removal of the plate, dry it in air and spray with 0.5% sodium nitrite in hydrochloric acid solution (0.1 mol/L), allow to stand for a few minutes, spray with 0.1% N-(1-naphthyl)-ethylenediamine dihydrochloride solution. No spots other than the principal spot in the chromatogram obtained with solution (1) are more intense than the principal spot obtained with solution (2), and not more than two of such spots are more intense than the

principal spot obtained with solution (3).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay To about 0.25 g, accurately weighed, add 30 ml of water and 20 ml of hydrochloric acid solution (1→2). Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 12.42 mg of $C_{12}H_{12}N_2O_2S$.

Category Antileprosy drug.

Storage Preserve in tightly closed containers.

Preparation Dapsone Tablets

Dapsone Tablets

Dapsone Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of dapsone ($C_{12}H_{12}N_2O_2S$).

Description White or almost white tablets.

Identification (1) Dissolve a quantity of the substance being examined in methanol to produce a solution of 5 µg per ml and filter. The succeeding filtrate complies with the test (1) for Identification described under Dapsone.

(2) Stir a quantity of powdered tablets equivalent to 0.1 g of dapsone with 20 ml of acetone, filter and evaporate the filtrate to dryness. The residue complies with test (3) for Identification described under Dapsone.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 20 ml of hydrochloric acid diluted with water to 1000 ml as the dissolution medium. Adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 60 minutes and filter, discard the initial filtrate, use the successive filtrate as the test preparation. Weigh accurately a quantity of dapsone CRS, previously dried to constant weight at 105°C, dissolve it in the dissolution medium to produce a solution of 50 µg per ml and use it as the reference preparation. Transfer accurately 2 ml each of the two preparations separately to two 25 ml volumetric flasks, to each add 5 ml of sodium hydroxide TS, dilute with water to volume and mix well. Measure the absorbances at 290 nm (Appendix IV A) and calculate the dissolution of $C_{12}H_{12}N_2O_2S$ from each tablet, not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to 0.25 g of dapsone. Carry out the Assay described under Dapsone. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 12.42 mg of $C_{12}H_{12}N_2O_2S$.

Category As described under Dapsone.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers.

Daunorubicin Hydrochloride

$C_{27}H_{29}NO_{10} \cdot HCl$ 563.98

[23541-50-6]

Daunorubicin hydrochloride is (1*S*, 3*S*)-3-Acetyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-10-methoxy-6,11-dioxo-1-naphthacenyl-3-amino-2,3,6-trideoxy- α -L-lyxo-hexopyranoside hydrochloride.

It contains not less than 88.9% of Daunorubicin ($C_{27}H_{29}NO_{10}$), calculated on the anhydrous and residual solvent-free basis.

Description An orange-red crystalline powder, hygroscopic. Freely soluble in water or methanol, slightly soluble in ethanol, practically insoluble in acetone.

Identification (1) The retention time of the principal peak of Daunorubicin in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of Daunorubicin CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Daunorubicin (Appendix VI).

(3) Dissolve about 10 mg in 0.5 ml of nitric acid, add 0.5 ml of water and heat over a flame for 2 minutes. Allow to cool and add silver nitrate solution TS. A white precipitate is formed.

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity An aqueous solution of 5 mg per ml, pH 4.5-6.5. (Appendix VI H).

Related substances Carry out the method and use the solution as described under Assay. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of chart. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 1.0 mg per ml as the test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well as the reference solution. Inject separately 10 μ l each of the test solution and the reference solution into the column and record the chromatogram for four times the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution are not greater than 1.5 times and 3 times of the area of the principal peak in the chromatogram obtained with the reference solution.

Residual solvent *chloroform, acetone, methanol, ethanol and 1-butanol*

Dissolve about 0.2 g, accurately weighed, in 5 ml of water in a head-sampling bottle. Encapsulate the bottle. Used as the test solution. Weigh accurately, a quantity of

chloroform, methanol, acetone, ethanol and 1-butanol, separately, dissolve with Dimethyl Sulphoxide to produce stock solutions individually. Measure accurately a quantity of each stock solution, dilute with water to obtain a mixed solution containing 6 μ g of chloroform, 20 μ g of acetone, 10 μ g each of methanol and ethanol, 0.2 mg of 1-butanol per ml. Measure 5 ml accurately in a head-sampling bottle. Encapsulate the bottle. Used as the reference solution.

Carry out the method for Residual solvent (Appendix VIII P). The gas chromatograph is equipped with a flame-ionization detector and a fused-silica capillary column coated with a layer of 6% cyanopropylphenyl/94% dimethylsiloxane or equivalent phase column. Maintain the temperature of the column at 50°C. The injection port is maintained at a temperature of 140°C. The detector is maintained at a temperature of 250°C. Nitrogen or Helium is used as the carrier gas, the flow rate is 5.0 ml per minute. Head-sampling method is used. The head-sampling condition is 80°C for 45 minutes. The injection volume is 1.0 ml. Inject the reference solution into the column and record the chromatogram. The resolution factor between main peaks complies with the related requirements. Inject separately each of the test solution and the reference solution into the column and record the chromatogram. Calculate the content of chloroform, methanol, acetone, ethanol and 1-butanol with respect to the peak area of chloroform, methanol, acetone, ethanol and 1-butanol obtained in the chromatogram by the external standard method respectively. The content of methanol and ethanol are not more than 0.2% individual. The content of 1-butanol is not more than 1.0%. The content of chloroform and acetone comply with the related requirements.

Water Not more than 3.0% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for Bacterial endotoxin (Appendix XI E); less than 4.3 EU per mg.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-acetonitrile (adjust the pH to 2.2 ± 0.2 with phosphoric acid) (62 : 38) as the mobile phase. The detection wavelength is 254 nm. Dissolve a quantity of daunorubicin CRS and doxorubicin hydrochloride CRS in mobile phase to produce a mixed solution containing 0.1 mg each of the two substances per ml. Inject 10 μ l of the solution into the column and record the chromatogram. The resolution factor between doxorubicin and daunorubicin is more than 2.0.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, with mobile phase to produce a solution containing 0.1 mg per ml. Inject 10 μ l into the column and record the chromatogram. Repeat the operation, using daunorubicin CRS instead of the substance being examined, calculate the content of daunorubicin ($C_{27}H_{29}NO_{10}$) with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antitumour.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Daunorubicin Hydrochloride for Injection

Daunorubicin Hydrochloride for Injection

Daunorubicin Hydrochloride for Injection is a

sterile mixture of Daunorubicin Hydrochloride and suitable amount of Mannitol or other excipient. It contains not less than 90.0% and not more than 115% of the labelled amount of Daunorubicin ($C_{27}H_{29}NO_{10}$).

Description A red loosen mass or powder.

Identification Complies with the tests (1) and (3) for Identification described under Daunorubicin Hydrochloride.

Related substances Carry out the method and use the solution as described under Daunorubicin Hydrochloride. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 1.0 mg per ml as the test solution. Measure accurately 1 ml to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well as the reference solution. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution are not greater than 2 times and 4 times of the area of the principal peak in the chromatogram obtained with the reference solution.

Content uniformity Complies with the test for content uniformity (Appendix X E), the content of daunorubicin in each bottle is calculated by Assay.

Acidity Carry out the method for Acidity described under Daunorubicin Hydrochloride.

Water Carry out the method for Water described under Daunorubicin Hydrochloride.

Bacterial endotoxin Carry out the method for Bacterial endotoxin described under Daunorubicin Hydrochloride.

Sterility Dissolve a quantity of the substance being examined in suitable amount of solvent, transfer to at least 500 ml of sterile 0.9% of sodium chloride solution. Complies with the test for sterility (Appendix XI H, membrane filtration method).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Take 10 packages. Dissolve the substance being examined in each original bottle with mobile phase and dilute to produce a solution of 0.1 mg per ml. Carry out the Assay described under Daunorubicin Hydrochloride. Calculate the content of daunorubicin in each bottle. The average value of these 10 contents is the final result.

Category As described under Daunorubicin Hydrochloride.

Strength 20 mg (Calculated on $C_{27}H_{29}NO_{10}$)

Storage Preserve in well closed containers, stored in a cool place and protected from light.

Decloxizine Hydrochloride

$C_{21}H_{28}N_2O_2 \cdot 2HCl$ 413.39

[3733-63-9]

Decloxizine Hydrochloride is 2-[2-[4-(Diphenylmethyl)-1-piperazinyl] ethoxy] ethanol dihydro-

chloride. It contains not less than 98.5% of $C_{21}H_{28}N_2O_2 \cdot 2HCl$, calculated on the dried basis.

Description A white to pale yellowish white powder; odourless; taste, bitter; hygroscopic.

Very soluble in water; freely soluble in ethanol; sparingly soluble in chloroform; very slightly soluble in acetone; insoluble in ether.

Melting range 201-207°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 0.1 g in 15 ml of ethanol, add 15 ml of trinitrophenol TS, allow to stand for 15 minutes and filter. Wash the residue with ethanol in portions, dry in vacuum for 2 hours. It melts at about 200°C with decomposition (Appendix VI C).

(2) The light absorption of a solution of 10 µg per ml in 0.1 mol/L sulfuric acid solution exhibits a maximum at 225 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Decloxizine Hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Loss on drying When dried to constant weight at 105°C, loses not more than 3.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.15% (Appendix VIII N).

Heavy metals Dissolve 0.5 g in a small quantity of water, add 2 ml of dilute acetic acid and sufficient water to produce 25 ml. Carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 15 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.67 mg of $C_{21}H_{28}N_2O_2 \cdot 2HCl$.

Category Antihistaminic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Decloxizine Hydrochloride Tablets

Decloxizine Hydrochloride Tablets

Decloxizine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of decloxizine hydrochloride ($C_{21}H_{28}N_2O_2 \cdot 2HCl$).

Description Sugar-coated tablets with white core; hygroscopic.

Identification (1) The light absorption of the solution obtained in the Assay exhibits a maximum at 224 nm (Appendix IV A).

(2) Shake a quantity of powdered tablets with water and filter, the filtrate yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 0.1 g of decloxizine hydrochloride in a 100 ml volumetric

flask add 0.1 mol/L hydrochloric acid solution to dissolve decloxizine hydrochloride and dilute to volume, mix well and filter. Discard the initial filtrate, transfer 2 ml of the successive filtrate, accurately measured, to another 100 ml volumetric flask, dilute with 0.1 mol/L hydrochloric acid solution to volume and mix well. Measure the absorbance of the resulting solution at 224 nm (Appendix IV A). Repeat the operation using a solution containing 20 µg per ml of decloxizine hydrochloride CRS in 0.1 mol/L hydrochloric acid solution in the same manner. Calculate the content of decloxizine hydrochloride ($C_{21}H_{23}N_2O_2 \cdot 2HCl$).

Category As described under Decloxizine Hydrochloride.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers, protected from light.

Dehydrocholic Acid

$C_{24}H_{34}O_5$ 402.53

[81-23-2]

Dehydrocholic Acid is 3,7,12-trioxo-5β-cholan-24-oic acid. It contains not less than 98.5% of $C_{24}H_{34}O_5$, calculated on the dried basis.

Description A white friable powder; odourless; taste, bitter.

Sparingly soluble in chloroform; slightly soluble in ethanol; practically insoluble in water; soluble in sodium hydroxide TS.

Specific optical rotation +29.0° to +32.5°, in a solution of 20 mg per ml in dioxane (Appendix VI E).

Identification (1) Dissolve about 5 mg in 1 ml of sulfuric acid and 1 drop of formaldehyde solution, allow to stand for 5 minutes, add 5 ml of water, a yellow colour with bluish green fluorescence is produced.

(2) To about 20 mg add 1 ml of ethanol, shake thoroughly, add 5 drops of dinitrobenzene solution (dissolve 1 g of dinitrobenzene in 100 ml of ethanol; freshly prepared,) and 0.5 ml of sodium hydroxide solution (1→8), allow to stand, a purple or purplish red is produced, changing to dark brown on standing.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dehydrocholic acid (Appendix XVI).

Odours To 2.0 g add 100 ml of water, boil for 2 minutes, no odour is produced.

Clarity and colour of ethanol solution To 0.10 g add 30 ml of ethanol, shake thoroughly to dissolve dehydrocholic acid, the solution is clear and colourless.

Chloride To 1.0 g add 100 ml of water, shake for 5 minutes, filter. Carry out the limit test for chloride (Appendix VIII A), using 25 ml of successive filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.02%).

Sulfate Carry out the limit test for sulfate (Appendix VIII

B), using 10 ml of the successive filtrate obtained in the test for chloride. Any opalescence produced is not more intense than that of a reference solution using 5.0 ml of potassium sulfate standard solution (0.05%).

Barium To 2.0 g add 100 ml of water and 2 ml of hydrochloric acid, boil for 2 minutes, allow to cool and filter, wash the filter paper with water, combine the washing and filtrate, dilute with water to 100 ml, mix well; to 10 ml of the solution add 1 ml of dilute sulfuric acid, no turbidity is produced.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Microbial limit test Salmonella species is absent (Appendix XI J).

Assay Weigh accurately about 0.5 g, add 60 ml of neutralized ethanol (neutral to phenolphthalein IS), heating on water bath to dissolve dehydrocholic acid, cool, add a few drops of phenolphthalein IS and 20 ml of freshly boiled and cooled water, titrate with sodium hydroxide (0.1 mol/L) VS, add 100 ml of freshly boiled and cooled water toward the end of titration, continue the titration to end point. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 40.25 mg of $C_{24}H_{34}O_5$.

Category Cholecystagogue.

Storage Preserve in tightly closed containers, protected from light.

Preparation Dehydrocholic Acid Tablets

Dehydrocholic Acid Tablets

Dehydrocholic Acid Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of dehydrocholic acid ($C_{24}H_{34}O_5$).

Description White tablets.

Identification Triturate 1 tablet with 10 ml of sodium carbonate TS to dissolve dehydrocholic acid, add diazotized sulfanilic acid TS, a red colour is produced gradually.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity equivalent to about 0.5 g of dehydrocholic acid, accurately weighed, add 40 ml of neutralized ethanol (neutral to phenolphthalein IS) and 20 ml of water, heating on water bath for 10 minutes, shake thoroughly to dissolve dehydrocholic acid. Add 3 drops of phenolphthalein IS, titrate with sodium hydroxide (0.1 mol/L) VS, add 100 ml of freshly boiled water toward the end of titration, continue the titration to end point. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 40.25 mg of $C_{24}H_{34}O_5$.

Category As described under Dehydrocholic Acid.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Deslanoside

$C_{47}H_{74}O_{19}$ 943.09

[17598-65-1]

Deslanoside is 3-[(*O*-β-*D*-glucopyranosyl)-(1→4)-*O*-2,6-dideoxy-β-*D*-ribo-hexopyranosyl)-(1→4)-*O*-2,6-dideoxy-β-*D*-ribo-hexopyranosyl)-(1→4)-*O*-2,6-dideoxy-β-*D*-ribo-hexopyranosyl)oxy]-12,14-dihydroxy-3β,5β,12β-card-20(22)-enolide. It contains not less than 96.0% and not more than 104.0% of $C_{47}H_{74}O_{19}$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter; hygroscopic.

Slightly soluble in methanol; very slightly soluble in ethanol; practically insoluble in water or chloroform.

Specific optical rotation +7° to +9°, in a solution of 20 mg per ml in anhydrous pyridine (Appendix VI E).

Identification (1) Dissolve about 2 mg in 2 ml of glacial acetic acid in a test tube, add 1 drop of ferric chloride TS, mix, and add slowly, along the wall, 2 ml of sulfuric acid to form a sub-layer; a brown ring is formed at the junction of the liquids and a greenish-blue colour is produced in the glacial acetic acid layer.

(2) Dissolve 2 mg in 2 ml of ethanol, add 10 drops each of 3,5-dinitrobenzoic acid TS and ethanolic potassium hydroxide TS, and mix; a violet colour is produced.

(3) Carry out the method for thin-layer chromatography (Appendix V B), using kieselguhr G as the coating substance, and a mixture of chloroform-tetrahydrofuran-formamide (50:50:6) as the mobile phase, the plate being impregnated with a mixture of formamide-acetone (1:9). Apply separately to the plate 2 μl each of two solutions in a mixture of chloroform and methanol (1:1) containing (1) 10 mg per ml of the substance being examined and (2) 10 mg per ml of deslanoside CRS. After developing and removal of the plate, dry at 120°C for 15 minutes, spray with a mixture of sulfuric acid-ethanol (1:9) and heat at 120°C for 20 minutes. Examine under ultra-violet light (365 nm), the fluorescence and position of the principal spots in the chromatogram obtained with these solutions should be identical.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of dichloromethane-methanol-water (75:23:2) as the mobile phase. Apply

separately to the plate 2 μl each of four solutions in a mixture of chloroform-methanol (1:1) containing (1) 10 mg, (2) 0.10 mg, (3) 0.20 mg and (4) 0.50 mg of the substance being examined per ml. After developing and removal of the plate, dry it in air and spray with sulfuric acid-ethanol (1:9), heat at 120°C for 2 minutes and examine under ultraviolet light (365 nm). Compare the intensity of each secondary spot in the chromatogram obtained with solution (1) with those of the principal spots obtained with the other solutions. The total amount of impurities assessed does not exceed 10%.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Transfer separately 10 mg of the substance being examined and deslanoside CRS into separate 50 ml volumetric flask, add a quantity of 70% ethanol to dissolve, dilute with 70% ethanol to volume and mix well. Measure accurately 5 ml to separate 25 ml volumetric flask, dilute with 70% ethanol to volume and mix well, as the test solution and the reference solution. Measure accurately 10 ml each of the two solutions. To each solution add 6 ml of alkaline trinitrophenol TS, accurately measured, mix well and allow to stand for 30 minutes at 20-25°C. Measure the absorbances (Appendix IV B) at 485 nm. Calculate the content of $C_{47}H_{74}O_{19}$.

Category Cardiac glycoside.

Storage Preserve in tightly closed containers, protected from light.

Preparation Deslanoside Injection

Deslanoside Injection

Deslanoside Injection is a sterile solution of deslanoside in 10% ethanol. It contains not less than 90.0% and not more than 110.0% of the labelled amount of deslanoside ($C_{47}H_{74}O_{19}$).

Description A colourless, clear liquid.

Identification Complies with the test (1) and (2) for Identification described under Deslanoside, using 4 ml of deslanoside injection.

pH value 5.0-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute 5 ml, accurately measured, with 70% ethanol and dilute to volume in a 25 ml volumetric flask, mix well, as the test solution. Dissolve an accurately weighed quantity of deslanoside CRS with 70% ethanol to produce a solution of 40 μg per ml as the reference solution. Carry out the Assay described under Deslanoside, beginning at the words "Measure accurately 10 ml each of the two solutions...". Calculate the content of $C_{47}H_{74}O_{19}$.

Category As described under Deslanoside.

Strength 2 ml:0.4 mg

Storage Preserve in well closed containers, protected from light.

Desoxycortone Acetate

$C_{23}H_{32}O_4$ 372.51

[152-58-9]

Desoxycortone Acetate is 21-(acetyloxy)-pregna-4-ene-3,20-dione. It contains not less than 96.0% and not more than 104.0% of $C_{23}H_{32}O_4$, calculate _____ r b _____.

Description A white or almost white crystalline powder; odourless.

Sparingly soluble in ethanol or acetone; slightly soluble in vegetable oil; practically insoluble in water.

Melting range 155-161°C (Appendix VI C).

Specific optical rotation +175° to +185°, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in ethanol at 240 nm (Appendix IV A), the value of A (1%, 1cm) is 430-460.

Identification (1) Dissolve about 5 mg in 0.5 ml of ethanol, add 0.5 ml of ammoniated silver nitrate TS, a black precipitation is produced.

(2) To about 50 mg add 2 ml of ethanolic potassium hydroxide solution, heat on water bath for 5 minutes and cool, add 2 ml of sulfuric acid (1→2), boil for 1 minute, the odour of ethyl acetate is perceptible.

Related substance Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of dichloromethane-ether-methanol-water (77 : 15 : 8 : 1.2) as the mobile phase. Apply separately to the plate 5 µl each of the solutions of substance being examined in chloroform-methanol (9 : 1) containing (1) 10 mg, (2) 0.1 mg and (3) 0.2 mg of the substance being examined per ml. After developing and removal of the plate, dry it in air, and examine under ultraviolet light at 254 nm. Any spot other than the principal spot in the chromatogram obtained with the solution (1) is not more intense than the principal spot in the chromatogram obtained with the solution (3). If one secondary spot in the chromatogram obtained with the solution (1) is more intense than the principal spot in the chromatogram obtained with the solution (2), it is not more intense than the principal spot in the chromatogram obtained with solution (3).

Loss on drying When dried to constant weight at 105°C, losses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve an accurately weighed quantity in aldehyde free ethanol to produce a solution of 35 µg per ml. To 10 ml, accurately measured, in 25 ml volumetric flask add 2 ml of vitastain TS rapidly under a current of nitrogen, stoppered, place in 30°C water bath for 1 hour, cool rapidly and dilute with aldehyde free ethanol to volume, shake well. Measure the absorbance (Appendix IV A) at 485 nm.

Repeat the operation using a quantity of Desoxycortone Acetate CRS and measure the absorbance correspondingly. Calculate the content of $C_{23}H_{32}O_4$.

Category Corticosteroids.

Storage Preserve in tightly close containers, protected from light.

Dexamethasone

$C_{22}H_{29}FO_5$ 392.47

Dexamethasone is 9-fluoro-11β,17,21-trihydroxy-16α-methyl-21-pregna-1,4-diene-3,20-dione. It contains not less than 97.0% and not more than 102.0% of $C_{22}H_{29}FO_5$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Sparingly soluble in acetone, ethanol methanol and dioxane; slightly soluble in chloroform; very slightly soluble in ether; insoluble or practically insoluble in water.

Melting range 254-264°C (melting range is not more than 4°C), with decomposition (Appendix VI C).

Specific optical rotation +72° to +82°, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of about 10 µg per ml in ethanol at 240 nm (Appendix IV A), the value of A (1%, 1 cm) is 380-410.

Identification (1) Dissolve 2 mg in 2 ml of sulfuric acid by shaking, a reddish-brown colour is produced within 5 minutes; add 10 ml of water and mix well, the colour disappears.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dexamethasone (Appendix XVI).

(3) It yields the reaction characteristic of organic fluorine compounds (Appendix III).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column (4.6 mm × 250 mm, 5 µm) packed with phenylsilane bonded silica gel and a mixture of 0.02 mol/L ammonium formate solution (Adjust the pH to 3.6 by aminic acid)-acetonitrile (78 : 22) as the mobile phase. Detection Wavelength is 254 nm. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce the test solution (1) of about 0.5 mg per ml. Measure accurately 1 ml the test solution into a 100 ml volumetric flask and dilute to volume with mobile phase, mix well as the reference solution (2); Dissolve a quantity of Methylprednisolone CRS in the test solution (1) to make a pre-test solution (3) of each 5 µg per ml. Inject proper quantities of the solution (3) into the column. The resolution factor between the peaks of methylprednisolone and dexamethasone is not less than 5.7 and the peak of methylprednisolone followed by the peak of dexamethasone. Inject 10 µl of the solution (2) into the column. Adjust the

attenuation so that the principal peak height in the chromatogram is about 40% of full scale of the chart. Inject separately accurately 10 μ l each of the solution (1) and (2) into the column, and record the chromatogram for triple the retention time of the principal peak. If there are any other impurity peaks in the chromatogram of solution (1), any peak area is not greater than the principal peak area of solution (2) and the sum of the areas of all peaks other than the principal peak is not greater than twice of area of the principal peak of solution (2).

Loss on drying When dried at 105°C for 3 hours, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (4 : 6) as the mobile phase. Detection wavelength is 240 nm, the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of dexamethasone. The resolution factor complies with related requirements.

Procedure Dissolve 15 mg of dexamethasone CRS, accurately weighed, in 2 ml of methanol in 50 ml volumetric flask, dilute with the mobile phase to volume, shake well. Inject 20 μ l of the resulting solution into the column. Repeat the operation using 15 mg of the substance being examined instead of dexamethasone CRS, calculate the content of $C_{22}H_{29}FO_5$.

Category Corticosteroid.

Storage Preserve in tightly closed containers and protected from light.

Preparation (1) Compound Dexamethasone Cream
(2) Dexamethasone Tablets

Compound Dexamethasone Acetate Cream

Compound dexamethasone acetate cream contains not less than 90.0% and not more than 110.0% of the labelled amount of dexamethasone acetate ($C_{24}H_{31}FO_6$).

Formula

Dexamethasone acetate	0.75 g
Camphor	10 g
Menthanol	10 g
Nipagin	1 g
Base	a quantity
Purified water	a quantity
To make	1000 g

Description A white cream; characteristic flavour of camphor.

Identification (1) Dissolve a quantity of camphor CRS and menthanol CRS in the anhydrous ethanol to produce a solution of 0.4 mg per ml respectively, use the solution as the reference solution. Carry out the method for gas chromatography (Appendix V E). Using a column packed with 10% polyglycol 20 M, maintain the column temperature at 150°C. The number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of camphor. The resolution factor between the peaks of camphor and menthanol is more than 2.0. Inject separately 2

μ l each of above two solutions in the Assay into the column and record the chromatogram, the chromatogram obtained with the solution shows two peaks with the same retention time as the peaks of camphor CRS and menthanol CRS in the chromatogram obtained with the reference solution corresponding.

(2) The retention time of the principal peak of dexamethasone acetate in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of dexamethasone acetate CRS in the chromatogram of the reference solution.

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay Carry out the method for high performance liquid chromatography (Appendix V D). Using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of dexamethasone acetate. The resolution factor among the peaks of dexamethasone acetate, internal standard substance and neighbour impurities complies with the related requirements.

Internal standard solution Dissolve a quantity of methyltestosterone CRS in methanol to produce a solution of about 0.20 mg per ml.

Procedure Weigh accurately a quantity of cream, equivalent to about 1.35 mg of dexamethasone acetate, into a beaker, add accurately measured 5 ml of internal standard solution, then add 20 ml of methanol, heat on water bath at 80°C with stirring, cool on ice bath until base freezes, filter, wash the base with two 10 ml portions of methanol, combine the filtrate and washings to a 50 ml volumetric flask, dilute with methanol to the volume, mix well, cool in ice bath for 2 hours, filter quickly and inject 20 μ l of the successive filtrate into the column and record the chromatogram. Dissolve about 13 mg of dexamethasone acetate CRS, weighed accurately, in a 50 ml volumetric flask, dilute with methanol to the volume, mix well. Measure accurately 5 ml of the solution and internal standard solution respectively in a 50 ml volumetric flask, dilute with methanol to the volume, mix well. Measure in the same manner, calculate the content of $C_{24}H_{31}FO_6$.

Category Corticosteroid.

Strength (1) 10 g : 7.5 mg (2) 20 g : 15 mg

Storage Preserve in tightly closed containers and stored in the cool place.

Dexamethasone Acetate

$C_{24}H_{31}FO_6$ 434.50

[1177-87-3]

Dexamethasone Acetate is 9 α -fluoro-11 β , 17 α , 21-trihydroxy - 16 α - methyl - pregna - 1,4 - diene - 3,20-dione-21-acetate. It contains not less than

97.0% and not more than 102.0% of $C_{24}H_{31}FO_6$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; taste, slightly bitter. Freely soluble in acetone; soluble in methanol or dehydrated ethanol; sparingly soluble in ethanol or chloroform; very slightly soluble in ether; insoluble in water.

Melting range 223-233°C, with decomposition (Appendix VI C).

Specific optical rotation +82° to +88°, in a solution of about 10 mg per ml in dioxane (Appendix VI E).

Specific absorbance Measure the absorbance of a solution of 15 µg per ml in ethanol at 240 nm (Appendix IV A), the value of *A* (1%, 1 cm) is 343-371.

Identification (1) Dissolve about 10 mg in 1 ml of methanol by warming, add 1 ml of hot alkaline cupric tartrate TS; a red precipitate is produced.

(2) To 50 mg add 2 ml of ethanolic potassium hydroxide TS, heat in a water bath for 5 minutes, cool, add 2 ml of sulfuric acid solution (1→2) and boil gently for 1 minute; the odour of ethyl acetate is perceived.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dexamethasone acetate (Appendix XVI).

(4) It yields the reaction characteristic of organic fluorine compounds (Appendix III).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-tetrahydrofuran-sodium acetate solution (Dissolve 12.0 g of sodium acetate in water and dilute to 1000 ml, mix well, adjust the pH to 4.5 ± 0.05 by glacial acetic acid) (30 : 10 : 60) as the mobile phase. Detect wavelength is 242 nm. The resolution factor between the peaks of dexamethasone acetate and hydrocortisone acetate is not less than 11.0. Dissolve about 25 mg of the substance being examined with 17 ml methanol in 25 ml volumetric flask, dilute with sodium acetate solution (pH 4.5) to volume, mix well as the test solution (1). Dissolve about 10 mg of hydrocortisone acetate with 7 ml of methanol in a 10 ml volumetric flask and dilute with sodium acetate solution (pH 4.5) to volume, mix well as the solution (2). Measure accurately each 1 ml of solution (1) and solution (2) into a 100 ml volumetric flask, dilute with mobile phase to the volume, mix well as the reference solution (3). Inject 20 µl of the solution (3) into the column, adjust the attenuation so that the peak height of dexamethasone acetate in the chromatogram is 35%-40% of full scale of the chart. Inject separately accurately 20 µl each of the solution (1) and (3) into the column, and record the chromatogram for twice the retention time of the principal peak. If there are any impurity peaks in the chromatogram of solution (1), any peak area is not greater than half of the peak area of dexamethasone acetate in solution (3) and the sum of the area of all peaks other than the principal peak is not greater than the area of dexamethasone acetate in solution (3).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Selenium Carry out the limit test for selenium (Appendix VIII D), using 0.10 g of the substance being examined; not more than 0.0050%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed

with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm, and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of dexamethasone acetate. The resolution factor between the peaks of dexamethasone acetate and internal standard complies with the related requirements.

Internal standard solution Dissolve methyltestosterone in the mobile phase to produce a solution of about 0.2 mg per ml.

Procedure Dissolve about 13 mg of dexamethasone acetate CRS, accurately weighed, in methanol in a 50 ml volumetric flask, and dilute with water to volume, mix well, as the reference solution. Transfer 5 ml each of the reference solution and the internal standard solution, accurately measured, in a 25 ml volumetric flask, dilute with the mobile phase to volume, mix well, inject 20 µl of the resulting solution into the column. Repeat the operation, using the substance being examined instead of dexamethasone acetate CRS, calculate the content of $C_{24}H_{31}FO_6$.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Dexamethasone Acetate Cream
(2) Dexamethasone Acetate Injection
(3) Dexamethasone Acetate Tablets

Dexamethasone Acetate Cream

Dexamethasone Acetate cream contains not less than 90.0% and not more than 110.0% of the labelled amount of dexamethasone acetate ($C_{24}H_{31}FO_6$).

Description A white cream.

Identification (1) To about 14 g of the ointment in a beaker add 50 ml of dehydrated ethanol, warm by heating on a water bath, cool in an ice bath, filter and evaporate the filtrate to dryness. The residue complies with test (1) for Identification described under Dexamethasone Acetate.

(2) To about 5 g of the ointment, add 30 ml of dehydrated ethanol, warm on a water bath, cool in an ice bath for 30 minutes and filter. To the filtrate add dehydrated ethanol to 20 ml, used as the solution (1). Dissolve 12.5 mg of dexamethasone acetate CRS in dehydrated ethanol to make up to 100 ml, used as the solution (2). Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-acetone (4:1) as the mobile phase. Apply separately to the plate 4 µl each of the two solutions. After developing and removal of the plate, dry it in air, spray with a mixture of sulfuric acid-dehydrated ethanol (4:1), heat at 105°C until the spot in the chromatogram obtained with the solution (2) is visualized. The principal spot in the chromatogram obtained with the solution (1) corresponds in colour and position to that in the chromatogram obtained with the solution (2).

(3) The retention time of principal peak in the chromatogram of the substance being examined, obtained in the Assay, is identical with that of principal peak in the chromatogram of the reference solution.

Tests (1), (3) and (1), (2) are alternative.

Other requirements Complies with the general requirements for creams (Appendix I F).

Assay Carry out the method for high performance liquid

chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (66 : 34) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column, calculated with the peak of dexamethasone acetate, is not less than 3500.

Procedure Dissolve a quantity of the cream, be equivalent to about 0.5 mg dexamethasone acetate, accurately weighed, with accurately 50 ml methanol and stir 30 second at 9500 rpm by homogenizer, then put in the ice water bath for 1 hour, filter with organic membrane (0.45 μ m), drop the first 5 ml and take the succeeding filtrate as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of dexamethasone acetate CRS, accurately weighed, and dilute with methanol to produce a solution of about 10 μ g per ml, repeat the operation, calculate the content of $C_{24}H_{31}FO_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Dexamethasone Acetate.

Strength (1) 4 g:2 mg (2) 5 g:2.5 mg
(3) 10 g:5 mg

Storage Preserve in tightly closed containers, stored at a cool place.

Dexamethasone Acetate Injection

Dexamethasone Acetate Injection is a sterile suspension of dexamethasone acetate. It contains not less than 90.0% and not more than 110.0% of the labelled amount of $C_{24}H_{31}FO_6$.

Description A suspension of minute granules which deposit on standing, a homogeneous creamy white suspension is obtained on shaking.

Identification (1) Evaporate 12 ml of suspension on water bath to dryness. The residue complies with the tests for Identification (1), (2) described under Dexamethasone Acetate.

(2) To 1 ml of suspension add 2 ml of sulfuric acid along with the tube wall, heat on water bath, a brownish-red ring is produced in the lower layer. Add carefully 5 ml of water and the brownish-red colour disappears.

Acidity pH 4.5-6.5 (Appendix VI H).

Other requirements Complies with the requirements for the injection (Appendix I B).

Assay *Reference preparation* Dissolve an accurately weighed quantity in dehydrated ethanol to produce a solution of 0.25 mg per ml.

Test preparation Measure accurately a quantity, shake well, equivalent to 20 mg of triamcinolon actonide acetate into a 100 ml volumetric flask, dilute with dehydrated ethanol to volume, and mix well. Filter with the dry filter paper, discard the initial filtrates and use the successive filtrate.

Procedure To 1 ml each of the two preparations, accurately measured, in separate dry test tube with stopper add 9 ml of dehydrated ethanol and 1 ml of triphenyl-tetrazolium chloride TS, accurately measured, and mix well, then add 1 ml of tetramethylammonium hydroxide TS, accurately measured, respectively. Allow to stand in a dark place at 25°C for 40-45 minutes. Carry out the method for spectrophotometry, measure the absorbance at 485 nm

(Appendix IV A). Calculate the content of $C_{24}H_{31}FO_6$.

Category As described under Dexamethasone Acetate.

Strength (1) 0.5 ml:2.5 mg (2) 1 ml:5 mg
(3) 5 ml:25 mg

Storage Preserve in well closed containers, protected from light.

Dexamethasone Acetate Tablets

Dexamethasone Acetate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dexamethasone acetate ($C_{24}H_{31}FO_6$).

Description White tablets.

Identification (1) The retention time of principal peak in the chromatogram of the substance being examined, obtained in the Assay, is identical with that of principal peak in the chromatogram of the reference solution.

(2) Macerate a quantity of powdered tablets equivalent to 7 mg of dexamethasone acetate in 25 ml of ethanol, shaking constantly for 15 minutes. Filter and evaporate the filtrate to dryness on a water bath, the residue yields the reaction characteristic of organic fluorine compounds (Appendix III).

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with ethanol and transfer to a 50 ml volumetric flask with 40 ml of ethanol. Heat in a water bath at 50-60°C for 10 minutes with constant shaking to dissolve dexamethasone acetate. Cool to room temperature, add ethanol to volume and shake thoroughly. Filter and discard the initial filtrate, measure the absorbance of the successive filtrate at 240 nm (Appendix IV A), calculate the content of $C_{24}H_{31}FO_6$, taking 357 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates of the column, calculated with the peak of dexamethasone acetate, is not less than 4000.

Procedure Weigh accurately and powder 20 tablets. To a quantity, weighed accurately, equivalent to about 2.5 mg of dexamethasone acetate in a 50 ml volumetric flask, add a quantity of mobile phase, for 30 minutes of ultrasonic treatment until dexamethasone acetate is dissolved. Dilute with mobile phase to the volume, shake well and filter, take the successive filtrate as the test solution. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of dexamethasone acetate CRS, accurately weighed, and dilute with methanol to produce a solution of about 50 μ g per ml, repeat the operation, calculate the content of $C_{24}H_{31}FO_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Dexamethasone Acetate.

Strength 0.75 mg

Storage Preserve in tightly closed containers, protected from light.

Dexamethasone Sodium Phosphate

$C_{22}H_{28}FNa_2O_8P$ 516.41

[2392-39-4]

Dexamethasone Sodium Phosphate is 9-fluoro-11 β ,17 α ,21-trihydroxy-16 α -methyl-21-pregna-1,4-diene-3,20-dione 21-(dihydrogen phosphate), disodium salt. It contains not less than 96.0% and not more than 102.0% of $C_{22}H_{28}FNa_2O_8P$, calculated on the dried basis.

Description A white to slightly yellow powder; odourless; taste, slightly bitter; hygroscopic.

Soluble in water or methanol; slightly soluble in acetone or ether.

Specific optical rotation $+72^\circ$ to $+80^\circ$, in a solution of about 10 mg per ml in water (Appendix VI E).

Identification (1) The retention time of principal peak in the chromatogram of the substance being examined, obtained in the Assay, is identical with that of principal peak in the chromatogram of the reference solution.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dexamethasone sodium phosphate (Appendix XVI).

(3) It yields the reaction characteristic of organic fluorine compounds (Appendix III).

(4) To 40 mg add 2 ml of sulfuric acid, heat gently until white fume evolves, add 0.5 ml of nitric acid dropwise, continue the heating until the vapor of nitrogen oxide is completely expelled, cool, add 2 ml of water dropwise, again heat gently until white fume evolves and the solution becomes slightly yellow, cool, add 10 ml of water dropwise, add ammonia TS until the solution is neutral to litmus paper, decolourize with a small amount of active carbon and filter, the filtrate yields the reactions characteristic of sodium salts and phosphates (Appendix III).

Alkalinity Dissolve 50 mg of the dried substance in 10 ml of water, pH 7.5-10.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.20 g in 10 ml of water is clear. Any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B), and any colour produced is not more intense than that of reference solution Y₂ (Appendix IX A, method 1).

Free phosphoric acid Dissolve 20 mg, accurately weighed, in 15 ml of water in a 25 ml volumetric flask. Add 11 ml of water to 4.0 ml of a standard phosphate solution [place 0.35 g of potassium dihydrogen phosphate, previously dried at 105°C for 2 hours and accurately weighed, in a 1000 ml volumetric flask, dissolve it in water, add 10 ml of sulfuric acid solution (3→10) and dilute with water to volume, mix well, dilute with water to 1/10 of its original concentration immediately before use] in another 25 ml volumetric flask; to each flask add 2.5 ml of molybdo-sulfuric acid TS and 1 ml of 1-amino-2-naphthol-4-sulfonic acid solution (mix well 5 g of anhydrous sodium sulfite and 94.3 g of sodium bisulfite with 0.7 g of 1-amino-2-naphthol-4-sulfonic acid, dissolve

1.5 g of this mixture in 10 ml of water immediately before use, filter if necessary), add water to volume and mix well, allow to stand at 20°C for 30-50 minutes. The absorbance of the solution containing the substance being examined, measured at 740 nm (Appendix IV A), is not greater than that of the standard solution.

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in mobile phase to produce a solution of about 1 mg per ml as the test solution (1). Dissolve a quantity of dexamethasone CRS, accurately weighed, in methanol to produce a solution of about 1 mg per ml as the reference solution (2). Measure accurately 1 ml each of solution (1) and solution (2) into a 100 ml volumetric flask and dilute with mobile phase to the volume, shake well as the solution (3). Inject 20 μ l of solution (3) into the column. Adjust the attenuation so that the principal peak height of dexamethasone sodium phosphate in the chromatogram is 15%-20% of full scale of the chart. Then inject separately 20 μ l of solution (1) and (2) into the column and record the chromatogram for twice of the retention time of the principal peak. If there is any peak which retention time is identical with that of dexamethasone in the chromatogram of solution (1), its area is not greater than 0.5% of the principal peak area of solution (2); The area of any peak other than the principal peak is not greater than 1/2 of that of the peak of dexamethasone sodium phosphate in solution (3), the sum of the area of all peaks other than the principal peak is not greater than twice of area of the peak of dexamethasone sodium phosphate in solution (3).

Methanol and acetone Dissolve about 0.16 g, accurately weighed, in water in a 10 ml volumetric flask, add 2 ml of 0.1% (ml/ml) *n*-propanol as internal standard, dilute with water to volume and mix well as the test solution (1). Measure about 7.9 mg of methanol and 79 mg of acetone, accurately weighed, into a 10 ml volumetric flask, dilute with water to volume as solution (2). Measure accurately 1 ml of solution (2) into a 10 ml volumetric flask, add 2 ml of internal standard, dilute with water to volume and shake well as the reference solution (3). Carry out the method for residual solvent (Appendix VIII P), using a column packed with macromolecule multihole glomerule. The number of theoretical plates of the column, calculated with the peak of *n*-propanol, is not less than 700. The temperature of the column is 150°C. The result complies with the related requirements.

Loss on drying When dried under reduced pressure to constant weight at 100°C, loses not more than 16.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of triethylamine solution (Dilute 7.5 ml of triethylamine with water to 1000 ml, adjust pH to 3.0 ± 0.05 with phosphoric acid)-methanol-acetonitrile (55:40:5) as the mobile phase. Detection wavelength is 242 nm and the number of theoretical plates of the column, calculated with the peak of dexamethasone sodium phosphate, is generally 7000. The resolution factor between the peaks of dexamethasone sodium phosphate and dexamethasone is not less than 4.4.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, with water in a 50 ml volumetric flask, and dilute with water to volume, shake well. Measure accurately proper quantities, dilute with mobile phase to produce a solution of about 40 μ g per ml. inject 20 μ l into the column and record the chromatogram. Repeat the operation using dexamethasone sodium phosphate CRS instead of the substance being examined, calculate the

content of $C_{22}H_{28}FN_2O_8P$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Corticosteroid.

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Preparation (1) Dexamethasone Sodium Phosphate Eye Drops
(2) Dexamethasone Sodium Phosphate Injection

Dexamethasone Sodium Phosphate Eye Drops

Dexamethasone Sodium Phosphate Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of Dexamethasone Sodium Phosphate ($C_{22}H_{28}FN_2O_8P$).

Description A colourless, clear liquid.

Identification The retention time of the principal peak in the chromatogram obtained with the test preparation is identical with that of the principal peak in the chromatogram of the reference solution.

pH value 7.0-8.5 (Appendix VI H).

Other requirements Comply with the general requirements for Eye preparations (Appendix I G).

Assay Carry out the Assay as described under Dexamethasone Sodium Phosphate. Measure accurately a quantity of the substance being examined, dilute with mobile phase to produce a solution of about 50 μ g per ml as the test solution (1). Dissolve about 12.5 mg of dexamethasone sodium phosphate CRS, accurately weighed, with water in a 50 ml volumetric flask and dilute with water to volume, shake well, then measure proper quantities and dilute with mobile phase to produce a solution of 50 μ g per ml as the reference solution (2). Inject separately 20 μ l of solution (1) and solution (2) into the column and record the chromatogram. Calculate the content of $C_{22}H_{28}FN_2O_8P$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Dexamethasone Sodium Phosphate.

Strength 5 ml:1.25 mg

Storage Preserve in well closed containers, protected from light.

Dexamethasone Sodium Phosphate Injection

Dexamethasone Sodium Phosphate Injection is a sterile solution of dexamethasone sodium phosphate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of dexamethasone sodium phosphate ($C_{22}H_{28}FN_2O_8P$).

It may also contain a stabilizer and a solubilizer.

Description A colourless and clear liquid.

Identification The retention time of the principal peak in the chromatogram obtained with the test preparation is

identical with that of the principal peak in the chromatogram of the reference solution.

pH value 7.0-8.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay as described under Dexamethasone Sodium Phosphate. Measure accurately a quantity of the substance being examined, dilute with mobile phase to produce a solution of about 50 μ g per ml as the test solution (1). Dissolve about 12.5 mg of dexamethasone sodium phosphate CRS, accurately weighed, with water in a 50 ml volumetric flask and dilute with water to volume, shake well, then measure proper quantities and dilute with mobile phase to produce a solution of 50 μ g per ml as the reference solution (2). Inject separately 20 μ l of solution (1) and solution (2) into the column and record the chromatogram. Calculate the content of $C_{22}H_{28}FN_2O_8P$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Dexamethasone Sodium Phosphate.

Strength (1) 1 ml:1 mg (2) 1 ml:2 mg
(3) 1 ml:5 mg

Storage Preserve in well closed containers, protected from light.

Dexamethasone Tablets

Dexamethasone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dexamethasone ($C_{22}H_{29}FO_5$).

Description White tablets.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak in the chromatogram of the reference solution.

(2) To 10 powdered tablets add 25 ml of methanol, shake for 30 minutes to dissolve dexamethasone and filter. Evaporate the filtrate on water bath to dryness. The residue complies with the test for Identification (3) described under Dexamethasone.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with 2 drops of methanol in a mortar and transfer to a 25 ml volumetric flask with mobile phase in several portions, shake thoroughly to dissolve dexamethasone and dilute with mobile phase to volume, then filter and take the successive filtrate as the test solution. Carry out the method as described under Assay. Calculate the content of $C_{22}H_{29}FO_5$.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Wet an accurately weighed quantity of the powder equivalent to 1.5 mg of dexamethasone with 4 drops of methanol in a 50 ml volumetric flask, add mobile phase and shake thoroughly to dissolve dexamethasone and dilute with mobile phase to volume, mix well and filter, take the successive filtrate as test solution. Dissolve 15 mg of dexamethasone CRS, weighed accurately, with 2 ml of methanol in a 50 ml volumetric flask and dilute with mobile phase to volume, mix well, then dilute with mobile phase to produce a solution of 30 μ g of dexamethasone CRS per ml as reference solution.

Carry out the Assay as described under Dexamethasone.

Category As described under Dexamethasone.

Strength 0.75 mg

Storage Preserve in tightly closed containers and protected from light.

Dextran 20

Dextran 20 is a high polymer of glucose produced by the fermentation of sucrose by a certain strain of *Leuconostoc mesenteroides* (L.-M-1226). It has an average molecular mass (M_w) of about 16000 to 24000.

Description A white powder; odourless; tasteless. Very soluble in hot water, insoluble in ethanol.

Specific optical rotation $+190^\circ$ to $+200^\circ$, in an aqueous solution of 10 mg per ml, measured at 25°C (Appendix VI E).

Identification Dissolve 0.2 g in 5 ml of water, add 2 ml of sodium hydroxide TS and a few drops of copper sulfate TS, a pale blue precipitation is produced which changes to brown on heating.

Chloride Dissolve 0.1 g in 50 ml of water by heating and cool. Carry out the limit test for chlorides (Appendix VIII A), using 10 ml. Any opalescence produced is not more pronounced than that of a reference solution using 5.0 ml of sodium chloride standard solution (0.25%).

Nitrogen Transfer 0.2 g to a 50 ml Kjeldahl flask, add 1 ml of sulfuric acid and heat until the substance being examined becomes a black oily mass, cool, add 2 ml of 30% hydrogen peroxide solution and heat until the solution is clear (if the solution is not clear, add 0.5 ml to 1.0 ml of 30% hydrogen peroxide solution and continue heating). Cool to below 20°C , add 10 ml of water and adjust to alkaline by adding dropwise 5% sodium hydroxide solution. Transfer the solution to 50 ml Nessler cylinder and wash the flask with water, add the washings to the Nessler cylinder and then add water to volume. Add slowly 2 ml of alkaline potassium mercuric-iodide TS with shaking and maintain the temperature below 20°C . Any colour produced is not more intense than that of a reference solution using 1.4 ml of ammonium sulfate standard solution (dissolve 0.4715 g of ammonium sulfate, previously dried at 105°C to constant weight and accurately weighed, in water and dilute to volume in a 100 ml volumetric flask, mix well. Dilute 1 ml, accurately measured, to 100 ml with water immediately before use. Each ml is equivalent to 10 μg of N) in place of the substance being examined (0.007%).

Loss on drying When dried at 105°C for 6 hours, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.5% (Appendix VIII N); using 1.5 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the Test for Residue on ignition: not more than 0.0008%.

Molecular mass and molecular mass distribution Dissolve a quantity of substance being examined in the mobile phase to produce a solution of 10 mg per ml. Shake then stand over night at room temperature, as the test solution. Repeat the operation using series of dextran CRS with known molecular mass, as the reference solution. Carry out the method for

size exclusion chromatography (Appendix H), using specific gel column for polysaccharides, and 0.71% sodium sulfate solution containing 0.2% sodium azide as the mobile phase and a differential refractometer as detector. The column temperature is at 35°C and flow rate is 0.5 ml per minute. Dissolve separately a quantity of glucose and dextran 2000 in the mobile phase to produce a solution of 10 mg per ml. Inject 20 μl into the column, record the retention time t_T and t_0 . The retention time of the test solution and the reference solution (t_R) are all between t_T and t_0 . The number of the theoretical plates of the column is not less than 5000, calculated with reference to the peak of glucose. Inject 20 μl of the reference solutions and the test solution separately into the column, record the chromatogram. The data is processed by special software for GPC. The average molecular mass of the 10% high fraction is not more than 70000, The average molecular mass of the 10% low fraction is not less than 3500.

Category Plasma volume extender.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Dextran 20 Glucose Injection
(2) Dextran 20 Sodium Chloride Injection

Dextran 20 Glucose Injection

Dextran 20 Glucose Injection is a sterile solution of dextran 20 in Glucose Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of dextran 20 and glucose ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$) respectively.

Description A clear, colourless, slightly viscous liquid, sometimes with a slight opalescence; taste, sweet.

Identification (1) To 1 ml add 2 ml of sodium hydroxide TS and a few drops of copper sulfate TS, a pale blue precipitate is produced, which turns to brown on heating.
(2) Add dropwise 1 ml to a warm alkaline copper tartrate TS, a red precipitate of cuprous oxide is produced.

pH value 3.5-6.5 (Appendix VI H).

Heavy metals Transfer 20 ml, accurately measured, to a crucible and evaporate to dryness, carry out the limit test for heavy metals (Appendix VIII H, method 2): not more than 0.00015%.

Undue toxicity Complies with the test for undue toxicity (Appendix XI C), by intravenous injection.

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix V D): less than 0.5 EU per ml.

Allergen Complies with the test of allergen (Appendix XI K).

Molecular mass and molecular mass distribution Carry out the method for Molecular mass and molecular mass distribution described under Dextran 20. It has a weight average molecular mass (M_w) of about 16000 to 24000, the weight average molecular mass of the 10% high fraction is not more than 70000, and the weight average molecular mass of the 10% low fraction is not less than 3500.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay *Dextran 20* Transfer 10 ml, accurately measured, to a 25 ml (for 6% injection) or 50 ml (for 10% injection) volumetric flask, add water to volume and mix well. Carry

out the determination of optical rotation (Appendix VI E), calculate the content of dextran according to the following formula:

$$C = 0.5128 \times (a - 0.4975C_1)$$

Where C is the weight of dextran 20 in 100 ml of injection (g);

a is optical rotation \times dilution factor 2.5 for 6% injection or 5.0 for 10% injection;

C_1 is content of glucose in 100 ml of injection determined under Assay (g).

Glucose Transfer 2 ml, accurately measured, to a stoppered conical flask, add 25 ml, accurately measured, of iodine solution (0.1 mol/L) VS and add dropwise 50 ml of sodium hydroxide solution (0.1 mol/L) VS with constant shaking. Allow to stand in a dark place for 30 minutes, add 5 ml of dilute sulfuric acid TS, titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration, continue the titration until the blue colour disappears. Perform a blank determination, using 0.12 g (6% injection) or 0.20 g (10% injection) of dextran 20, and make any necessary correction. Each ml of iodine (0.1 mol/L) VS is equivalent to 9.909 mg of $C_6H_{12}O_6 \cdot H_2O$.

Category As described under Dextran 20.

Strength (1) 10% Dextran 20 Glucose Injection 100 ml: 10 g of dextran 20 + 5 g of glucose; 250 ml: 25 g of dextran 20 + 12.5 g of glucose; 500 ml: 50 g of dextran 20 + 25 g of glucose
(2) 6% Dextran 20 Glucose Injection 100 ml: 6 g of dextran 20 + 5 g of glucose; 250 ml: 15 g of dextran 20 + 12.5 g of glucose; 500 ml: 30 g of dextran 20 + 25 g of glucose

Storage Preserve in a place below 25°C.

Dextran 20 Sodium Chloride Injection

Dextran 20 Sodium Chloride Injection is a sterile solution of dextran 20 in Sodium Chloride Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of dextran 20 and sodium chloride (NaCl) respectively.

Description A clear, colourless, slightly viscous liquid, sometimes with a slight opalescence; taste, salty.

Identification (1) Complies with test (1) for Identification described under Dextran 20 Glucose Injection.
(2) Yields the reactions characteristic of sodium salts and chlorides (Appendix IV).

pH value 4.0-7.0 (Appendix VI H).

Molecular mass and molecular mass distribution Carry out the method for Molecular mass and molecular mass distribution described under Dextran 20. It has a weight average molecular mass (M_w) of about 16000 to 24000, the weight average molecular mass of the 10% high fraction is not more than 70000, and the weight average molecular mass of the 10% low fraction is not less than 3500.

Heavy metals, Undue toxicity, Bacterial endotoxin, Allergen Complies with the corresponding requirements described under Dextran 20 Glucose Injection.

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay *Dextran 20* Transfer 10 ml, accurately measured, to a 25 ml (for 6% injection) or 50 ml (for 10% injection)

volumetric flask, add water to volume and mix well. Carry out the determination of optical rotation (Appendix VI E), calculate the content of dextran according to the following formula:

$$C = 0.5128a$$

Where C is the weight of dextran 20 (g) in 100 ml of injection;

a is optical rotation \times dilution factor 2.5 for 6% injection or 5.0% for 10% injection.

Sodium chloride Measure accurately 10 ml to a conical flask, add a few drops of potassium chromate IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 5.844 mg of sodium chloride.

Category As described under Dextran 20.

Strength (1) 10% Dextran 20 Sodium Chloride Injection 100 ml: 10 g dextran 20 + 0.9 g sodium chloride; 250 ml: 25 g dextran 20 + 2.25 g sodium chloride; 500 ml: 50 g dextran 20 + 4.5 g sodium chloride
(2) 6% Dextran 20 Sodium Chloride Injection 100 ml: 6 g dextran 20 + 0.9 g sodium chloride; 250 ml: 15 g dextran 20 + 2.25 g sodium chloride; 500 ml: 30 g dextran 20 + 4.5 g sodium chloride

Storage Preserve in a place below 25°C.

Dextran 40

Dextran 40 is a high polymer of glucose produced by the fermentation of sucrose by a certain strain of *Leuconostoc mesenteroides* (L.-M-1226). It has an average molecular mass (M_w) of about 32000 to 42000.

Description A white powder; odourless; tasteless. Very soluble in hot water, insoluble in ethanol.

Specific optical rotation Complies with the test described under Dextran 20.

Identification Complies with the test for Identification described under Dextran 20.

Molecular mass and molecular mass distribution Carry out the method described under Dextran 20. The average molecular mass of the 10% high fraction is not more than 120000. The average molecular mass of the 10% low fraction is not less than 5000.

Chloride, Nitrogen, Loss on drying, Residue on ignition, Heavy metals Complies with the corresponding requirements described under Dextran 20.

Category Plasma volume extender.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Dextran 40 Glucose Injection
(2) Dextran 40 Sodium Chloride Injection

Dextran 40 Glucose Injection

Dextran 40 Glucose Injection is a sterile solution of dextran 40 in Glucose Injection. It contains not less than 95.0% and not more than 105.0% of the

labelled amount of dextran 40 and glucose ($C_6H_{12}O_6 \cdot H_2O$).

Description A clear, colourless and slightly viscous liquid, sometimes with a slight opalescence; taste, sweet.

Identification Complies with the tests for Identification described under Dextran 20 Glucose Injection.

Molecular mass and molecular mass distribution Carry out the method described under Dextran 20 Glucose Injection. The average molecular mass is about 32000 to 42000. The average molecular mass of the 10% high fraction is not more than 120000. The average molecular mass of the 10% low fraction is not less than 5000.

pH value, Heavy metals, Undue toxicity, Bacterial endotoxin, Allergen Complies with the corresponding requirements described under Dextran 20 Glucose Injection.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Dextran 20 Glucose Injection, using dextran 40 instead of dextran 20 in the blank determination.

Category As described under Dextran 40.

Strength (1) 10% dextran 40 Glucose Injection 100 ml: 10 g of dextran 40 + 5 g of glucose; 250 ml: 25 g of dextran 40 + 12.5 g of glucose; 500 ml: 50 g of dextran 40 + 25 g of glucose
(2) 6% Dextran 40 Glucose Injection 100 ml: 6 g of dextran 40 + 5 g of glucose; 250 ml: 15 g of dextran 40 + 12.5 g of glucose; 500 ml: 30 g of dextran 40 + 25 g of glucose

Storage Stored in a place below 25°C.

Dextran 40 Sodium Chloride Injection

Dextran 40 Sodium Chloride Injection is a sterile solution of dextran 40 in Sodium Chloride Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of dextran 40 and sodium chloride (NaCl).

Description A clear, colourless and slightly viscous liquid, sometimes with a slight opalescence; taste, salty.

Identification Complies with the tests for Identification described under Dextran 20 Sodium chloride Injection.

pH value 4.0-7.0 (Appendix VI H).

Molecular mass and molecular mass distribution Carry out the method described under Dextran 20 Glucose Injection. The average molecular mass is about 32000 to 42000. The average molecular mass of the 10% high fraction is not more than 120000. The average molecular mass of the 10% low fraction is not less than 5000.

Heavy metals, Undue toxicity, Bacterial endotoxin, Allergen Complies with the corresponding requirements described under Dextran 20 Glucose Injection.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Dextran 20 Sodium Chloride Injection.

Category As described under Dextran 40.

Strength (1) 10% dextran 40 Glucose Injection 100 ml: 10

g of dextran 40 + 0.9 g of sodium chloride; 250 ml: 25 g of dextran 40 + 2.25 g of sodium chloride; 500 ml: 50 g of dextran 40 + 4.5 g of sodium chloride

(2) 6% Dextran 40 Sodium Chloride Injection 100 ml: 6 g of dextran 40 + 0.9 g of sodium chloride; 250 ml: 15 g of dextran 40 + 2.25 g of sodium chloride; 500 ml: 30 g of dextran 40 + 4.5 g of sodium chloride

Storage Stored in a place below 25°C.

Dextran 70

Dextran 70 is a high polymer of glucose produced by the fermentation of sucrose by a certain strain of *Leuconostoc mesenteroides* (L.-M-1226). It has an average molecular mass (M_w) of about 64000 to 76000.

Description A white powder; odourless; tasteless. Very soluble in hot water, insoluble in ethanol.

Specific optical rotation Complies with the test described under Dextran 20.

Identification Complies with the test for Identification described under Dextran 20.

Molecular mass and molecular mass distribution Carry out the method described under Dextran 20. The average molecular mass of the 10% high fraction is not more than 185000. The average molecular mass of the 10% low fraction is not less than 15000.

Chloride, Nitrogen, Loss on drying, Residue on ignition, Heavy metals Complies with the corresponding requirements described under Dextran 20.

Category Plasma volume extender.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Dextran 70 Glucose Injection
(2) Dextran 70 Sodium Chloride Injection

Dextran 70 Glucose Injection

Dextran 70 Glucose Injection is a sterile solution of dextran 70 in Glucose Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of dextran 70 and glucose ($C_6H_{12}O_6 \cdot H_2O$).

Description A clear, colourless and slightly viscous liquid, sometimes with a slight opalescence; taste, sweet.

Identification Complies with the tests for Identification described under Dextran 20 Glucose Injection.

Molecular mass and molecular mass distribution Carry out the method described under Dextran 20 Glucose Injection. The average molecular mass is about 64000 to 76000. The average molecular mass of the 10% high fraction is not more than 185000. The average molecular mass of the 10% low fraction is not less than 15000.

pH value, Heavy metals, Undue toxicity, Bacterial endotoxin, Allergen Complies with the corresponding requirements described under Dextran 20 Glucose Injection.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Dextran 20 Glucose Injection, using dextran 70 instead of dextran 20 in the blank determination.

Category As described under Dextran 70.

Strength 500 ml: 30 g of dextran 70 and 25 g of glucose

Storage Stored in a place below 25°C.

Dextran 70 Sodium Chloride Injection

Dextran 70 Sodium Chloride Injection is a sterile solution of dextran 70 in Sodium Chloride Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of dextran 70 and sodium chloride (NaCl).

Description A clear, colourless and slightly viscous liquid, sometimes with a slight opalescence; taste, salty.

Identification Complies with the tests for Identification described under Dextran 20 Sodium Chloride Injection.

pH value 4.0-7.0 (Appendix VI H).

Molecular mass and molecular mass distribution Carry out the method described under Dextran 20 Glucose Injection. The average molecular mass is about 64000 to 76000. The average molecular mass of the 10% high fraction is not more than 185000. The average molecular mass of the 10% low fraction is not less than 15000.

Heavy metals, Undue toxicity, Bacterial endotoxin, Allergen Complies with the corresponding requirements described under Dextran 20 Glucose Injection.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Dextran 20 Sodium Chloride Injection.

Category As described under Dextran 70.

Strength 500 ml: 30 g of dextran 70 + 4.5 g of sodium chloride

Storage Stored in a place below 25°C.

Diatrizoic Acid

$C_{11}H_9I_3N_2O_4 \cdot 2H_2O$ 649.95 [500978-11-5]

Diatrizoic Acid is 3,5-bis (acetyl amino)-2,4,6-triiodo-benzoic acid, dihydrate. It contains not less than 98.5% of $C_{11}H_9I_3N_2O_4$, calculated on the dried basis.

Description A white powder; odourless; taste, slightly sour. Very slightly soluble in water; soluble in ammonia solution or solution of alkali hydroxides.

Identification (1) Heat about 10 mg in a crucible, violet iodine vapour is evolved.

(2) Carry out the method for thin-layer chromatography (Appendix V B), using silica gel HF_{254} as the coating substance and a mixture of *n*-butanol-glacial acetic acid-water (4:1:5) as the mobile phase. Apply separately to the plate 10 μ l each of (1) a 1 mg per ml solution of the substance being examined in methanol containing 0.08% of sodium hydroxide; (2) a 1 mg per ml solution of diatrizoic acid CRS in the same solvent. After developing and removal of the plate, examine it under an ultraviolet light (254 nm). The principal spots obtained with the two solutions are identical in position.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diatrizoic acid (Appendix XVI).

Colour of alkaline solution Dissolve 4.8 g in sodium hydroxide TS to produce 10 ml. The solution is not more intensely coloured than a reference solution prepared by mixing 5 ml of reference solution Y_3 or OR_2 with 5 ml of water.

Acidity Shake 1.0 g with 20 ml of water for a few minutes, filter, the filtrate has a pH value of 2.5-3.5 (Appendix VI H).

Free iodine To 2.0 ml of the solution obtained in the test for Colour of alkaline solution, add water to produce 10 ml and add dilute acetic acid until the solution is acid to litmus paper. Add 0.5 g of potassium iodide, shake to dissolve it, add 1 ml of starch IS and mix well. Any colour produced is not more intense than, or different from, that of a reference obtained by repeating the operation using 1 ml of water instead of 1 ml of starch IS.

Halides Dissolve 2.0 g in 4 ml of sodium hydroxide TS, add 30 ml of water, then add dropwise 3 ml of dilute nitric acid, stir for a few minutes to precipitate diatrizoic acid and filter. Wash the residue with a small quantity of water, combine the washings with the filtrate and add water to produce 50 ml, mix well. Filter again, if necessary. Carry out the limit test for chlorides (Appendix VIII A) using 20 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 4.0 ml of sodium chloride standard solution (0.005%).

Iodide To 20 ml of the filtrate obtained in the test for Halides, add 1 ml of chloroform, 3 ml of dilute nitric acid and 1 ml of strong hydrogen peroxide solution, shake and allow to stand. The chloroform layer is not more intensely coloured than that of a reference obtained by repeating the operation using 20 ml of dilute potassium iodide solution (to 2.0 ml of 0.0013% potassium iodide solution, add water to produce 20 ml) instead of the filtrate (0.0025%).

Assay Dissolve 1.0 g in 5 ml of dilute hydrochloric acid and sodium hydroxide TS, add water to produce 100 ml, mix well. To 10 ml of the solution add 5 ml of sodium nitrite solution (0.1 mol/L) and 10 ml of hydrochloric acid solution (9 → 100), mix well and allow to stand for 10 minutes, add 5 ml of 2.5% ammonium sulfamate solution, mix well and allow to stand for 5 minutes. Add 2 ml of alkaline β -naphthol TS, 15 ml of sodium hydroxide TS and sufficient water to produce 50 ml, mix well. Measure the absorbance at 485 nm (Appendix IV A); not greater than 0.25.

Loss on drying When dried at 130°C to constant weight, loses not more than 6.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Iron To the residue obtained in the test for Residue on

ignition add 1 ml of hydrochloric acid, evaporate on a water bath to dryness. To the residue add 1 ml of dilute hydrochloric acid and a quantity of water, heat on a water bath and filter. Wash the crucible with a small quantity of water, combine the washings with the filtrate and add water to produce 25 ml. Carry out the limit test for iron (Appendix VIII G), any colour produced is not more intense than that of a reference using 1.0 ml of iron standard solution (0.001%).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using 1.0 g: not more than 0.001%.

Assay Weigh accurately about 0.4 g, add 30 ml of sodium hydroxide TS and 1.0 g of powdered zinc, heat under reflux for 30 minutes, allow to cool, wash tube of the condenser with a small quantity of water and filter. Wash the flask and the filter with three portions of 15 ml each of water. Combine the washings with the filtrate, add 5 ml of glacial acetic acid and 5 drops of eosin sodium IS, titrate with silver nitrate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 20.46 mg of $C_{16}H_{13}ClN_2O$.

Category Diagnostic aid.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Meglumine Diatrizoate Injection
(2) Sodium Diatrizoate Injection

Diazepam

$C_{16}H_{13}ClN_2O$ 284.74

[439-14-5]

Diazepam is 7-chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one. It contains not less than 98.5% of $C_{16}H_{13}ClN_2O$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter. Freely soluble in acetone or chloroform; soluble in ethanol; practically insoluble in water.

Melting range 130-134°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in 5% sulfuric acid in methanol at 284 nm (Appendix IV A), the value of A (1%, 1cm) is 440-468.

Identification (1) Dissolve about 10 mg in 3 ml of sulfuric acid, the solution exhibits yellowish-green fluorescence when examined under an ultraviolet light at 365 nm.

(2) The light absorption of a solution of 5 µg per ml in 0.5% methanolic sulfuric acid solution exhibits maxima at 242 nm, 284 nm and 366 nm; the absorbance at 242 nm is about 0.51 and that at 284 nm is about 0.23 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diazepam (Appendix XVI).

(4) Carry out the method for oxygen flask combustion

(Appendix VII C) with 20 mg, using 5 ml of 5% sodium hydroxide solution as the absorbing liquid. When the combustion is completed, acidify the solution with dilute nitric acid and boil gently for two minutes. The solution yields the reactions characteristic of chlorides (Appendix III).

Clarity and colour of ethanol solution A solution of 0.1 g in 20 ml of ethanol is clear and colourless. Any colour produced is not more intense than reference Solution Y₁ (Appendix IX A, method 1).

Chloride Shake 1.0 g with 50 ml of water for 10 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85:15) as the mobile phase. Detection wavelength is at 254 nm, and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of diazepam. Dissolve a quantity of diazepam in methanol to produce the test solution, 0.45 mg per ml. Measure accurately 1 ml of the test solution to 100 ml volumetric flask and dilute with methanol to the volume, mix well to produce the reference solution. Inject accurately 20 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% -25% of the full scale of the chart. Inject accurately 20 µl each of the test and reference solution into the column separately. Record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the p p p g solution is not greater than 0.3 of the principal peak area of the reference solution (3/10).

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in a mixture of 10 ml of glacial acetic acid and 10 ml of acetic anhydride, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until a green colour is produced. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 28.47 of $C_{16}H_{13}ClN_2O$.

Category Anxiolytic and anticonvulsant agent.

Storage Preserve in tightly closed containers.

Preparation (1) Diazepam Injection
(2) Diazepam Tablets

Diazepam Injection

Diazepam Injection is a sterile solution of diazepam in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of diazepam ($C_{16}H_{13}ClN_2O$).

Description A clear, almost colourless to yellowish-green liquid.

Identification (1) To 2 ml add dropwise dilute potassium iodobismuthate TS, an orangish-red precipitate is produced. (2) The retention time of principal peak in the chromatogram obtained with substance being examined in the Assay is identical with that of diazepam CRS, treated similarly.

pH value 6.0-7.0 (Appendix VI H).

Colour of solution Not more intense than reference solution YG₆ (Appendix IX A, method 1).

Related substances Dissolve a quantity in methanol to produce two solutions containing 1 mg per ml (solution 1) and 5 µg per ml (solution 2) respectively. Carry out the method described under Assay. Inject 10 µl of solution (2) into the column, adjust the attenuation so that the principal peak height is about 10% of the full scale of the chart. Inject accurately 10 µl each of solution (1) and (2) into the column separately, record the chromatogram for four times of the retention time of the principal peak. The sum of the peak areas corresponding impurities is not greater than the principal peak area of solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (70 : 30) as the mobile phase. Detection wavelength is 254 nm, and the number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of diazepam. The resolution factor between the peaks of diazepam and internal standard complies with related requirements.

Internal standard solution Dissolve 50 mg of naphthalene in methanol in a 25 ml volumetric flask and dilute to volume, mix well.

Procedure Dissolve a quantity equivalent to 10 mg of diazepam, accurately weighed, in a 50 ml volumetric flask. Add 10 ml of internal standard solution and dilute with methanol to the volume, mix well. Inject accurately 10 µl of the resulting solution into the column. Repeat the operation, using 10 mg of diazepam CRS instead of the substance being examined, accurately weighed, calculate the content of C₁₆H₁₃ClN₂O.

Category As described under Diazepam.

Strength 2 ml : 10 mg

Storage Preserve in well closed containers, protected from light.

Diazepam Tablets

Diazepam Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of diazepam (C₁₆H₁₃ClN₂O).

Description White tablets.

Identification (1) Shake a quantity of the powdered tablets equivalent to about 10 mg of diazepam with 10 ml of acetone to dissolve diazepam, filter, evaporate the filtrate to dryness. Dissolve the residue in 3 ml of sulfuric acid with shaking, the solution exhibits yellowish-green fluorescence when examined under an ultraviolet light at 365 nm.

(2) The light absorption of the solution obtained in Assay exhibits three maxima at 242 nm, 284 nm and 366 nm (Appendix IV A).

Related substances Shake a quantity of the powdered tablets equivalent to 200 mg of diazepam with 5 ml of acetone, filter, use the successive filtrate as solution (1). Dilute solution (1) with acetone to 0.20 mg per ml as solution (2). Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating

substance, and a mixture of ethyl acetate-hexane (1:1) as the mobile phase. Apply to the plate separately 5 µl each of solution (1) and (2). After the developing and removal of the plate, allow it to dry. Examine under an ultraviolet light (254 nm). Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Content uniformity Comply with the requirements (Appendix X E). Shake 1 tablet in a 100 ml volumetric flask with 5 ml of water, after the tablet is disintegrated, add about 60 ml of 0.5% sulfuric acid in methanol, shake well to dissolve diazepam, dilute with 0.5% sulfuric acid in methanol to volume, mix well. Filter, measure accurately 10 ml of the successive filtrate into a 25 ml volumetric flask, dilute with 0.5% sulfuric acid in methanol to volume and mix well. Measure the absorbance at 284 nm (Appendix IV A). Calculate the content of C₁₆H₁₃ClN₂O, taking 454 as the value of A (1%, 1 cm).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 800 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 10 ml of the solution at exact 20 minutes and filter. Measure the absorbance of the successive filtrate at 242 nm (Appendix IV A). Calculate the dissolution of C₁₆H₁₃ClN₂O from each tablet, taking 1018 as the value of A (1%, 1 cm), not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder equivalent to about 10 mg of diazepam in a 100 ml volumetric flask, add 5 ml of water and mix well. Allow to stand for 15 minutes, add about 60 ml of 0.5% sulfuric acid in methanol, shake thoroughly to dissolve diazepam, add 0.5% sulfuric acid in methanol to volume, mix well. Filter, measure accurately 10 ml of the successive filtrate to 100 ml volumetric flask, dilute with 0.5% sulfuric acid in methanol to volume and mix well. Measure the absorbance of the solution at 284 nm (Appendix IV A), calculate the content of C₁₆H₁₃ClN₂O, taking 454 as the value of A (1%, 1 cm).

Category As described under Diazepam.

Strength (1) 2.5 mg (2) 5 mg

Storage Preserve in tightly closed containers.

Diclofenac Sodium

C₁₄H₁₀Cl₂NNaO₂ 318.13

[15307-79-6]

Diclofenac Sodium is sodium 2-[(2,6-dichlorophenyl) amino] phenyl acetate. It contains not less than 98.5% of C₁₄H₁₀Cl₂NNaO₂, calculated on the dried basis.

Description A white or almost white crystalline powder; irritant to nose and hygroscopic. Freely soluble in ethanol; sparingly soluble in water;

insoluble in chloroform.

Identification (1) The light absorption of a solution of 20 µg per ml in water exhibits a maximum at 276 nm in range of 240-340 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diclofenac sodium (Appendix XVI).

(3) Mix about 50 mg with 0.2 g sodium carbonate and ignite until charred, cool. Dissolve the residue in 5 ml of water, boil and filter. The filtrate yields the reaction characteristic of chlorides (Appendix III).

(4) The residue obtained by igniting yields the reaction characteristic of sodium salts (Appendix III).

Acidity or alkalinity Dissolve 0.5 g in 50 ml of water, pH 6.5-7.5 (Appendix VI H).

Clarity and colour of ethanol solution Dissolve 0.5 g in 10 ml of ethanol; any opalescence produced is not more pronounced than that of an equal volume of reference suspension 1 (Appendix IX B); any colour produced is not more intense than that of an equal volume of reference solution Y₃ (Appendix IX A).

Chloride Dissolve 0.5 g in 48 ml of water, add 2 ml of dilute nitric acid dropwise, mix thoroughly and filter. Carry out the limit test for chloride (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more pronounced than that of a reference solution using 5 ml of sodium chloride standard solution (0.02%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-chloroform-glacial acetic acid (25:25:0.2) as the mobile phase. Apply separately to the plate 10 µl each of two solutions of the substance being examined in ethanol containing (1) 10 mg per ml, (2) 0.1 mg per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light at 254 nm. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Heavy metals Dissolve 2.0 g in 45 ml of water by heating gently, add slowly 5 ml of dilute hydrochloric acid with constant shaking and filter. Carry out the limit test for heavy metals (Appendix VIII H), using 25 ml filtrate; not more than 0.001%.

Assay Dissolve about 0.5 g, accurately weighed, in 50 ml of water by gently heating, cool, add 10 drops of a mixture of methyl-red and bromocresol-green IS, titrate with sulfuric acid (0.05 mol/L) VS until the colour of the solution changes to pale yellowish-green. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 31.81 mg of C₁₄H₁₀Cl₂NNaO₂.

Category Anti-inflammatory and analgesic non-steroids anti-inflammatory agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Diclofenac Sodium Enteric-coated Tablets

Diclofenac Sodium and Codeine Phosphate Tablets

Diclofenac Sodium and Codeine Phosphate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of diclofenac sodium (C₁₄H₁₀Cl₂NNaO₂) and codeine phosphate (C₁₈H₂₁NO₃ · H₃PO₄ · 1 $\frac{1}{2}$ H₂O) in each tablet.

Formula	Diclofenac sodium	25 g
	Codeine Phosphate (C ₁₈ H ₂₁ NO ₃ · H ₃ PO ₄ · 1 $\frac{1}{2}$ H ₂ O)	15 g
	Excipient	a quantity
	to make	1000 tablets

Description White or almost white tablets.

Identification Weigh a quantity of the powdered tablets equivalent to about 10 mg of diclofenac sodium and 6 mg of codeine phosphate respectively into a 100 ml separator, add 5 ml of 0.1 mol/L sodium hydroxide solution, shake thoroughly, extract with 30 ml of chloroform, wash the chloroform layer with 0.1 mol/L sodium hydroxide solution, transfer the chloroform layer into conical flask and evaporate in vacuum to dryness, the residue is used for identification sample of codeine phosphate; combine the washing and aqueous layer, filter into a 100 ml volumetric flask, dilute with water to volume (equivalent to about 10 mg of diclofenac sodium) and mix well, the aqueous solution is used for identification of diclofenac sodium. (1) The light absorption of the aqueous solution exhibits a maximum at 276 nm (Appendix IV A).

(2) To the residue add 0.5 ml of sulfuric acid containing 2.5 mg of selenic acid, a green colour is produced immediately which turns to blue gradually.

(3) Dissolve a quantity of the powdered tablets equivalent to about 25 mg of diclofenac sodium and 15 mg of codeine phosphate in methanol and dilute to produce a solution containing 2.5 mg of diclofenac sodium and 1.5 mg of codeine phosphate per ml as the test solution. Dissolve a quantity of diclofenac sodium and codeine phosphate CRS in methanol to produce solutions of 2.5 mg of diclofenac sodium per ml and 1.5 mg of codeine phosphate per ml as the reference solutions respectively. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia solution (85:10:5) as the mobile phase. Apply separately to the plate 10 µl of each of the above three solutions, after developing and removal of the plate, dry it in air and examine under ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution correspond in position to the principal spots obtained with the reference solutions. Then spray with dilute potassium iodobismuthate TS, the colour of the spot of codeine phosphate turns to orange-red.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). To 1 tablet in a 50 ml volumetric flask add 5 ml of water and shake, after the tablet is disintegrated, add 10 ml of ethanol and a quantity of water, sonicate for 15 minutes, dilute with water to volume, shake thoroughly and filter through a membrane filter, use the successive filtrate as the test solution. Carry out the procedure as described under the Assay, beginning at

the words "Inject 10 μ l of the test solution into the column...". Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ and $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$ respectively.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 500 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution after exactly 45 minutes and filter through a membrane. Use the successive filtrate as the test solution. Dilute 5 ml of the reference solution as described under the Assay, accurately measured, in a 50 ml volumetric flask, with water to volume and mix well as the reference solution. Measure accurately 25 μ l each of the test solution and the reference solution, carry out the method as described under the Assay. Calculate the dissolution of $C_{14}H_{10}Cl_2NNaO_2$ and $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.04 mol/L sodium heptanesulfonate solution-acetonitrile (1:1.2) as the mobile phase (adjust to pH 6.1 ± 0.2 with acetic acid). Detection wavelength is 280 nm and the number of the theoretical plates of the column is not less than 800, calculated with reference to the peak of codeine phosphate. The resolution factor between the peaks of codeine phosphate and diclofenac sodium is more than 2.0.

procedure Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 25 mg of diclofenac sodium and 15 mg of codeine phosphate to 50 ml volumetric flask, add about 40 ml of 20% (V/V) ethanol solution, sonicate for 15 minutes, dilute to volume with 20% (V/V) ethanol solution, shake thoroughly and filter through a membrane filter, use the successive filtrate as the test solution. Inject 10 μ l of the test solution into the column, record the peak areas correspondingly obtained in the chromatogram. Weigh accurately about 25 mg of diclofenac sodium CRS and 15 mg of codeine phosphate CRS to 50 ml volumetric flask, dissolve with 20% (V/V) ethanol solution and dilute to volume, mix well as the reference solution. Repeat the operation, using the reference solution instead of the test solution. Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ and $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1\frac{1}{2}H_2O$ respectively with respect to the peak areas obtained in the chromatogram by the external standard method. The coefficient 1.068 is used in the calculation of the content of codeine phosphate.

Category Analgetic.

Storage Preserve in tightly closed containers, protected from light.

Diclofenac Sodium Enteric-coated Tablets

Diclofenac Sodium Enteric-coated Tablets contain not less than 90.0% and not more than 110.0% of labelled amount of diclofenac sodium ($C_{14}H_{10}Cl_2NNaO_2$).

Description Enteric-coated tablets with white or almost

white core.

Identification (1) Weigh a quantity of the powdered tablets with enteric-coating removed equivalent to about 0.25 g of diclofenac sodium, add 10 ml of ethanol with shaking and filter, using the filtrate as test solution. Dissolve a quantity of diclofenac sodium CRS in ethanol to produce a solution of 25 mg per ml as reference solution. Carry out the thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of ethyl acetate-chloroform-glacial acetic acid (25:25:0.2) as the mobile phase. Apply separately to the plate 10 μ l each of above two solutions. After developing and removal of the plate, dry it in air and examine under ultraviolet light at 254 nm. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(2) The light absorption of the solution obtained in Assay exhibits a maximum at 284 nm in range of 240-300 nm (Appendix IV A).

(3) Yields the reaction characteristic of sodium salts (Appendix III).

Drug Release Comply with the requirements for drug release test [Appendix X D, method 2 (2)], with the apparatus of dissolution test method 1 and using 1000 ml of 0.1 mol/L hydrochloric acid solution as the release medium and adjust the rotational speed of the paddle to 100 rpm. Withdraw a quantity of the solution at 2 hours and filter. Take the successive filtrate as test solution (1). Immediately put the basket into the 1000 ml of preliminary heated to 37.0°C of phosphate BS (pH 6.8), with the same rotational speed of the basket. Withdraw a quantity of the solution at 45 minutes and filter. Transfer accurately 5 ml of the successive filtrate to a 10 ml volumetric flask and dilute with phosphate BS (pH 6.8) to the volume, mix well as test solution (2). Dissolve 20 mg of diclofenac sodium CRS, accurately weighed, and dilute with water to the volume of a 100 ml volumetric flask, mix well as the solution A. Transfer accurately 2 ml of the solution A to a 100 ml volumetric flask and dilute with 0.1 mol/L hydrochloric acid solution to the volume, mix well as reference solution of test solution (1). Transfer accurately 5 ml of the solution A, to a 100 ml volumetric flask and dilute with phosphate BS (pH 6.8) to the volume, mix well as reference solution of test solution (2). Measure the absorbances of the resulting solution at 276 nm (Appendix IV A), calculate the dissolution of $C_{14}H_{10}Cl_2NNaO_2$ from each tablet.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder finely 20 tablets with enteric-coating removed or without enteric-coating removed (for film enteric-coated tablets). Weigh accurately a quantity of the powdered tablets equivalent to about 50 mg of diclofenac sodium into a 100 ml volumetric flask and dissolve in 70 ml of ethanol with shaking. Add ethanol to volume, shake thoroughly and filter. Measure accurately 2 ml of successive filtrate and transfer to a 100 ml volumetric flask, add ethanol to volume and mix well. Carry out the method for spectrophotometry (Appendix IV A), and measure the absorbance at 284 nm. Repeat the operation, weigh accurately 50 mg of diclofenac sodium CRS instead of the substance being examined. Calculate the content of ($C_{14}H_{10}Cl_2NNaO_2$).

Category, Storage As described under diclofenac sodium.

Strength 25 mg

Diclofenamide

$C_6H_4Cl_2N_2O_4S_2$ 305.15

[120-07-8]

Diclofenamide is 4,5-dichloro-1,3-benzene-disulfonamide. It contains not less than 98.0% of $C_6H_4Cl_2N_2O_4S_2$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless; taste, slightly bitter. Soluble in ethanol; practically insoluble in water or chloroform; freely soluble in alkali solutions.

Melting range 238-242°C (Appendix VI C).

Identification (1) Heat to melt a small quantity with a quantity of sodium carbonate or sodium hydroxide; the gas evolved turns moistened red litmus paper blue; ignite until the mixture is incinerated, the residue yields the reactions characteristic of chlorides and sulfates (Appendix III).

(2) The light absorption of a solution of 0.10 mg per ml in 0.4% sodium hydroxide solution exhibits maxima at 284 nm and 294 nm; the absorbance is about 0.43 and 0.36, respectively (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diclofenamide (Appendix XVI).

Clarity of alkaline solution A solution of 1.0 g in 10 ml of sodium hydroxide TS is clear.

Chloride To 0.25 g add 25 ml of water, shake for 5 minutes and filter, carry out the limit test for chlorides (Appendix VIII A), using the filtrate. Any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.028%).

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Heavy metals Not more than 0.001%, using 1.0 g (Appendix VIII H, method 3).

Assay Carry out the determination of nitrogen (Appendix VII D, method 1), using about 0.3 g, accurately weighed. Each ml of sulfuric acid (0.05 mol/L) VS is equivalent to 15.26 mg of $C_6H_4Cl_2N_2O_4S_2$.

Category Carbonic anhydrase inhibitor.

Storage Preserve in tightly closed containers, protected from light.

Preparation Diclofenamide Tablets

Diclofenamide Tablets

Diclofenamide Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of diclofenamide ($C_6H_4Cl_2N_2O_4S_2$).

Description White tablets.

Identification (1) Comply with test (1) for Identification described under Diclofenamide, using a quantity of the powdered tablets equivalent to 0.2 g of diclofenamide.

(2) The light absorption of the solution obtained in the Assay exhibits maxima at 284 nm and 294 nm (Appendix IV A).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately, and powder 10 tablets. To a quantity of the powder, accurately weighed, equivalent to about 50 mg of diclofenamide in a 100 ml volumetric flask add 50 ml of 0.4% sodium hydroxide solution and shake thoroughly. Add 0.4% sodium hydroxide solution to volume and mix well. Filter, transfer accurately 20 ml of the successive filtrate to another 100 ml volumetric flask, add 0.4% sodium hydroxide solution to volume and mix well. Measure the absorbance of the resulting solution at 284 nm (Appendix IV A). Calculate the content of $C_6H_4Cl_2N_2O_4S_2$, taking 43.4 as the value of A (1%, 1 cm).

Category As described under Diclofenamide.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Diethylamine Salicylate

$C_{11}H_{17}NO_3$ 211.26

Diethylamine Salicylate is the salicylate of diethylamine. It contains $C_{11}H_{17}NO_3$ not less than 99.0%, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, sweet and slight bitter; hygroscopic. Very soluble in water; freely soluble in ethanol, chloroform or acetone; slightly soluble in ether.

Melting range 99-102°C (Appendix VI C).

Identification (1) To an aqueous solution, add 1 drop of ferric trichloride TS; a violet colour is produced.

(2) To about 0.1 g add 5 ml of sodium hydroxide TS, heat; the characteristic odour of ammonia is perceived, the vapor turns moistened red litmus paper to blue.

(3) The light absorption of a solution of 20 µg per ml in ethanol, exhibits two maxima at 227 nm and 297 nm, a minimum at 257 nm.

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diethylamine salicylate (Appendix XVI).

Clarity of solution Dissolve 0.50 g in 25 ml of water, the solution is clear.

Acidity Dissolve 0.25 g in 10 ml of water, pH 5.0-6.5 (Appendix VI H).

Loss on drying When dried to constant weight at 80°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VII N).

Heavy metals Dissolve 1.0 g in a quantity of water, add 2

ml of acetate BS (pH 3.5), dilute with water to 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Assay Dissolve about 0.2 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS, until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.13 mg of $C_{11}H_{17}NO_3$.

Category Anti-inflammatory and analgesic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Diethylamine Salicylate Cream

Diethylamine Salicylate Cream

Diethylamine Salicylate Cream contains not less than 90.0% and not more than 110.0% of labelled amount of diethylamine salicylate ($C_{11}H_{17}NO_3$).

Description A white to faintly yellow cream.

Identification (1) Mix a quantity of the ointment equivalent to 0.2 g diethylamine salicylate with 10 ml of water, stir thoroughly to dissolve diethylamine salicylate, the filtrate complies with the tests (1) and (2) for Identification described under Diethylamine Salicylate.

(2) The solution obtained in the Assay complies with test (3) for Identification described under Diethylamine Salicylate.

Acidity or alkalinity Mix 3.0 g with 10 ml of water, stir thoroughly, pH 6.5-7.5 (Appendix VI H).

Other requirements Comply with the general requirements for cream (Appendix I F).

Assay Dissolve a quantity equivalent to about 20 mg of diethylamine salicylate in a beaker with 20 ml of ethanol by stirring. Transfer to a 100 ml volumetric flask, dilute with ethanol to volume and mix well. Transfer accurately 10 ml of the solution to a 100 ml volumetric flask, dilute to volume and mix well. Measure the absorbance of the resulting solution at 297 nm (Appendix IV A) and calculate the content of $C_{11}H_{17}NO_3$, taking 186 as the value of A (1%, 1 cm).

Category As described under Diethylamine Salicylate.

Strength (1) 20 g : 2 g (2) 20 g : 4 g (3) 30 g : 3 g (4) 30 g : 6 g

Storage Preserve in tightly closed containers, protected from light.

98.0% of $C_{10}H_{21}N_3O \cdot C_6H_8O_7$, calculated on the dried basis.

Description A white, crystalline powder; odourless; taste, sour and bitter; slightly hygroscopic. Very soluble in water; sparingly soluble in ethanol; insoluble in acetone, chloroform or ether.

Melting range 135-139°C (Appendix VI C).

Identification (1) Dissolve 0.2 g in 2 ml of water, make alkaline with sodium hydroxide TS and extract with 5 ml of chloroform. Evaporate the chloroform extract to dryness and add 2 ml of ammonium molybdate-sulfuric acid TS, heat in a water bath; a blue precipitate is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diethylcarbamazine citrate (Appendix XVI).

(3) The water layer remaining in the above test yields the reaction characteristic of citrates (Appendix III).

N-methylpiperazine Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-ammonia solution (13:5:1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 50 mg of the substance being examined per ml, (2) 50 μ g of N-methylpiperazine CRS per ml. After developing and removal of the plate, dried it in the air and visualize in iodine vapour. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 2.0 g in 20 ml of water, add 1.0 ml of 1 mol/L hydrochloric acid solution and sufficient water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1): not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 1 ml of acetic anhydride and 10 ml of glacial acetic acid, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.14 mg of $C_{10}H_{21}N_3O \cdot C_6H_8O_7$.

Category Antifilaria drug.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Diethylcarbamazine Citrate Tablets

Diethylcarbamazine Citrate

$C_{10}H_{21}N_3O \cdot C_6H_8O_7$ 391.42

[1642-54-2]

Diethylcarbamazine Citrate is 4-methyl-N, N-diethyl-1-piperazinecarboxamide, 2-hydroxy-1,2,3-propanetricarboxylate. It contains not less than

Diethylcarbamazine Citrate Tablets

Diethylcarbamazine Citrate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount of diethylcarbamazine citrate ($C_{10}H_{21}N_3O \cdot C_6H_8O_7$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 0.2 g of diethylcarbamazine citrate add 10 ml of water, shake to dissolve diethylcarbamazine citrate, filter. The filtrate complies with the tests (1) and (3) for Identification described under Diethylcarbamazine Citrate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 0.25 g of diethylcarbamazine citrate in a conical flask with stopper add 0.20 g of tartaric acid (powdered and dried at 105°C for 2 hours before use) and 10 ml of glacial acetic acid, boil gently for 3-5 minutes and cool. Add 5 ml of acetic anhydride and 1 drop of crystal violet IS and mix well. Titrate with perchloric acid (0.1 mol/L) VS, shaking vigorously for 2 minutes toward the end of the titration, until the colour of the solution changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 39.14 mg of $C_{10}H_{21}N_3O \cdot C_6H_8O_7$.

Category As described under Diethylcarbamazine Citrate.

Strength (1) 50 mg (2) 100 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Diethylstilbestrol

$C_{18}H_{20}O_2$ 268.36

[56-53-1]

Diethylstilbestrol is α, α' -diethyl-(*E*)-4,4'-stilbenediol. It contains not less than 97.0% and not more than 103.0% of $C_{18}H_{20}O_2$, calculated on the dried basis.

Description Colourless crystals or a white crystalline powder; almost odourless.

Soluble in ethanol, ether or fatty oil; slightly soluble in chloroform; practically insoluble in water; soluble in dilute sodium hydroxide solutions.

Melting point 169-172°C (Appendix VI C).

Identification (1) Dissolve about 10 mg in 1 ml of sulfuric acid; the solution is orangish-yellow in colour; the colour disappears on diluting with 10 ml of water.

(2) In the Assay, the retention time of the two principal peaks in the chromatogram obtained with the test preparation corresponds with that of the two principal peaks in the chromatogram obtained with the reference preparation.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diethylstilbestrol (Appendix XVI).

Acidity or alkalinity Dissolve 0.10 g in 5.0 ml of 70% ethanol, the solution is neutral to litmus paper.

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in a mixture of ethanol-water (1:1) to produce a solution of about 0.5 mg per ml (1). Transfer accurately 1 ml of solution (1) to a 50 ml volumetric flask and dilute with the mixture of ethanol-water (1:1) to volume, shake well as solution (2). Inject 10 μ l of solution (2) into the column. Adjust the attenuation so that the principal peak height in the chromatogram is about 20% of full scale of the chart. Then inject separately 10 μ l of solution (1) and (2) into the

column, and record the chromatogram for twice of the retention time of the peak of *cis*-isomer. There are no more than 4 other peaks except the *trans*-isomer and *cis*-isomer peaks in the chromatogram of solution (1), the area of any one is not greater than half of the sum of the area of *trans*-isomer and 1.26 times of the area of *cis*-isomer of solution (2), the sum of the areas of all peaks other than the *trans*-isomer and *cis*-isomer peaks is not greater than 3/4 of the sum of the area of *trans*-isomer and 1.26 times of the area of *cis*-isomer of solution (2).

Loss on drying when dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsine bonded silica gel and a mixture of methanol-water (80:20) as the mobile phase. Detection wavelength is 254 nm and the number of theoretical plates of the column is not less than 1000, calculated with reference to the peak of *trans*-isomer of diethylstilbestrol. Dissolve about 10 mg of diethylstilbestrol CRS in 50 ml of chloroform, allow it to stand in dark place for not less than 5 hours. Evaporate chloroform of 5.0 ml of the resulting solution and dissolve the residue in 25 ml of the mixture of ethanol-water (1:1). Inject 10 μ l of the solution into the column, record the chromatogram, the relative retention time between *trans*-isomer and *cis*-isomer of diethylstilbestrol is 1:1.33. The resolution factor between the peak of *trans*-isomer and *cis*-isomer is not less than 10.

Procedure Dissolve a quantity of diethylstilbestrol CRS, accurately weighed, in a mixture of ethanol-water (1:1) and dilute to produce a solution of about 0.1 mg per ml, inject 10 μ l into the column and record the chromatogram. Repeat the operation, using the substance being examined instead of the diethylstilbestrol CRS. Calculate the content of $C_{18}H_{20}O_2$ with respect to the sum of the peak areas of *trans*-isomer and *cis*-isomer obtained in the chromatogram by the external standard method (the peak area of *cis*-isomer multiplied by 1.26).

Category Estrogen

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Diethylstilbestrol Injection
(2) Diethylstilbestrol Tablets

Diethylstilbestrol Injection

Diethylstilbestrol Injection is a sterile solution of diethylstilbestrol in oil. It contains not less than 90.0% and not more than 110.0% of the labelled amount of diethylstilbestrol ($C_{18}H_{20}O_2$).

Description A clear, faint yellow to pale yellow oily liquid.

Identification In the Assay, the retention time of the two principal peaks in the chromatogram obtained with the test preparation corresponds with that of the two principal peaks in the chromatogram obtained with the reference preparation.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay as described under Diethylstilbestrol. Measure accurately a quantity of the substance being examined, dilute with ether to produce a solution of

about 200 μg per ml and shake well. Measure accurately 5 ml of the solution into a tube with plug for centrifugation. Evaporate ether in the bath of warm water and extract 5 times with methanol (Each 5 ml before the fifth time and 3 ml in the fifth time), at each time shake for 10 minutes and centrifugate for 15 minutes. Collect the methanol layer in a 25 ml volumetric flask and dilute with methanol to volume, mix well. Inject 10 μl into the column and record the chromatogram. Dissolve a quantity of diethylstilbestrol CRS, accurately weighed, with methanol to produce a solution of about 40 μg per ml, and repeat the operations of the above solution. Calculate the content of $\text{C}_{18}\text{H}_{20}\text{O}_2$ with respect to the sum of the peak areas of *trans*-isomer and *cis*-isomer obtained in the chromatogram by the external standard method (the peak area of *cis*-isomer multiplied by 1.26).

Category As described under Diethylstilbestrol.

Strength (1) 1 ml : 0.5 mg (2) 1 ml : 1 mg
(3) 1 ml : 2 mg (4) 1 ml : 3 mg

Storage Preserve in tightly closed containers, protected from light.

Diethylstilbestrol Tablets

Diethylstilbestrol Tablets contain not less than 90.0% and not more than 110.0% of the labelled
..... μl 1 1 $\text{C}_{18}\text{H}_{20}\text{O}_2$..

Description White tablets.

Identification (1) Place a quantity of the powdered tablets equivalent to about 20 mg of diethylstilbestrol in a separator. Add 15 ml of water containing 2 drops of hydrochloric acid, extract with 30 ml of ether, evaporate the ether extract to dryness. The residue complies with tests (1) for Identification described under Diethylstilbestrol.

(2) In the Assay, the retention time of the principal peak in the chromatogram obtained with the test preparation corresponds with that of the principal peak in the chromatogram of the reference preparation.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with ethanol-water (1:1) and transfer to a 25 ml volumetric flask in portions with dehydrated ethanol, dissolve the diethylstilbestrol by ultrasonical treatment, cool, dilute with dehydrated ethanol to the volume, shake well, filter and use the successive filtrate as the test solution. Dissolve a quantity of diethylstilbestrol CRS, accurately weighed, in ethanol-water (1:1) and dilute to produce a solution with the same concentration as the test solution. Carry out the procedure as described under Assay using above two solutions, calculate the content of $\text{C}_{18}\text{H}_{20}\text{O}_2$.

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of 0.1% lauryl sodium sulfate solution as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw 5 ml of the solution at exact 45 minutes and filter, take the successive filtrate as the test solution. Dissolve about 10 mg of diethylstilbestrol CRS, accurately weighed, with a mixture of ethanol-water (1:1) in a 250 ml volumetric flask and dilute to volume, shake well. Measure a quantity of the solution and dilute with the dissolution medium to produce a solution of about 2 μg (for strength 0.5 mg), 4 μg (for strength 1 mg), 8 μg (for strength 2 mg), 12 μg (for strength 3 mg) per ml as the reference solution. Carry out the method described under the Assay. Inject separately 50

μl of the test and the reference solution into the column and record the chromatogram. Calculate the dissolution of $\text{C}_{18}\text{H}_{20}\text{O}_2$ from each tablet with respect to the sum of the peak areas of *trans*-isomer and *cis*-isomer obtained in the chromatogram by the external standard method (the peak area of *cis*-isomer multiplied by 1.26). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. Weigh accurately a quantity of the powder, add a quantity of the mixture of ethanol-water (1:1), and supersonic until diethylstilbestrol is dissolved. Dilute with the mixture to produce a solution of about 0.1 mg per ml and filter, take 10 μl of the successive filtrate as the test solution. Carry out the method described under the Assay of Diethylstilbestrol. Calculate the content of $\text{C}_{24}\text{H}_{31}\text{FO}_6$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Diethylstilbestrol.

Strength (1) 0.5 mg (2) 1 mg (3) 2 mg (4) 3 mg

Storage Preserve in tightly closed containers, protected from light.

Difenidol Hydrochloride

$\text{C}_{21}\text{H}_{27}\text{NO} \cdot \text{HCl}$ 345.91

[3254-89-5]

Difenidol Hydrochloride is α , α -diphenyl-1-piperidine-butanol hydrochloride. It contains not less than 98.5% of $\text{C}_{21}\text{H}_{27}\text{NO} \cdot \text{HCl}$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, astringent.

Freely soluble in methanol; soluble in ethanol; sparingly soluble in water or chloroform.

Melting range 217-222°C, with decomposition (Appendix VI C).

Identification (1) To 1-2 mg add 1 ml of water and 0.5 ml of sulfuric acid, a yellow colour is produced, which disappears on mixing well.

(2) Dissolve about 5 mg in 1 ml of a 1% solution of citric acid in acetic anhydride and warm in a water bath for about 3 minutes, a rose-red colour is produced.

(3) The light absorption of the solution obtained in the test for Alkene exhibits maxima at 258 nm and 252 nm, a minimum at 244 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of difenidol hydrochloride (Appendix XVI).

(5) The aqueous solution yields the reaction characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Alkene The light absorbance of a 0.30 mg per ml of the solution in ethanol at 251 nm is not greater than 0.36

(Appendix IV A).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve 0.25 g, accurately weighed, in 40 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 34.59 mg of $C_{21}H_{27}NO \cdot HCl$.

Category Antiemetic.

Storage Preserve in tightly closed containers.

Preparation Difenidol Hydrochloride Tablets

Difenidol Hydrochloride Tablets

Difenidol Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of difenidol hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

Description Sugar-coated or film coated tablets with white core.

Identification Triturate four tablets, add 20 ml of ethanol and shake to dissolve difenidol hydrochloride. Filter and evaporate the filtrate to dryness. Use the residue for the following tests.

(1) Complies with tests (1) and (2) for Identification described under Difenidol Hydrochloride.

(2) Dissolve the residue in water, add a few drops of dilute nitric acid and silver nitrate TS, a white curdy precipitate is produced.

Dissolution Comply with the dissolution test (Appendix X C, method 2), using 900 ml water as the dissolution medium, rotate the paddle at 50 rpm. Withdraw a quantity of solution at exact 30 minutes and filter. Take the successive filtrate as test solution. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.5% triethylamine solution (adjust with phosphoric acid to pH of 4.0)-methanol (40 : 60) as the mobile phase. Detection wavelength is 220 nm and the number of theoretical plates of the column is not less than 1500, the resolution factor between the peaks of difenidol and the impurities complies with the related requirements. Inject accurately 20 μ l of the test solution into the column, record the chromatogram. Repeat the operation, dissolve a quantity of difenidol hydrochloride CRS, weigh accurately, in water to produce a solution of 25 μ g per ml. Calculate the dissolution of $C_{21}H_{27}NO$ from each tablet, with respect to the peak area obtained in the chromatogram by the external standard method. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Moisten 10 tablets with ethanol to a fine powder, triturate and extract with three successive portions of ethanol, 20 ml, 15 ml and 15 ml. Filter, wash with a small amount of ethanol and evaporate the combined filtrates to dryness, then dry at 105°C for 1 hour. Carry out the Assay described under Difenidol Hydrochloride beginning at

the words "Dissolve in 40 ml of glacial acetic acid, ...". Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 34.59 mg of $C_{21}H_{27}NO \cdot HCl$.

Category, Storage As described under Difenidol Hydrochloride.

Strength 25 mg

Diflunisal

$C_{13}H_8F_2O_3$ 250.20

Diflunisal is 2',4'-difluoro-4-hydroxy-3-biphenylcarboxylic acid. It contains not less than 98.5% of $C_{13}H_8F_2O_3$, calculated on the dried basis.

Description A white or almost white crystal or crystalline powder; odourless.

Freely soluble in methanol, soluble in ethanol, slightly soluble in chloroform, practically insoluble in water.

Identification (1) Dissolve about 2 mg in 10 ml of ethanol, add 1 drop of ferric chloride TS, a dark purple colour is produced.

(2) Dissolve a quantity, in 0.1 mol/L hydrochloric acid in ethanol to produce a solution of 20 μ g per ml. The light absorption of the resulting solution exhibits two maxima at 251 nm and 315 nm (Appendix IV A).

The ratio of the absorbance at 251 nm to that at 315 nm is 4.2-4.6.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diflunisal (Appendix XXIII)

Related substances A Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of *n*-hexane-dioxane-glacial acetic acid (85 : 10 : 5) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in methanol containing (1) 10 mg per ml, (2) 50 μ g per ml of the substance being examined. After developing and removal of the plate, dry it in air and examine under ultra-violet light at 254 nm. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Related substances B Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of water-methanol-acetonitrile-glacial acetic acid (55 : 23 : 30 : 2) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of diflunisal. Inject 20 μ l of solution (2), obtained under the related substances A, into the column. Adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of full scale of the chart. Inject separately 20 μ l each of the solution (2) and the solution (1), obtained under the related substances A, into the column, and record the chromatograms for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained from the solution (1) is not greater than the area of the principal peak in the chromatogram obtained from solution (2).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 60°C, loses not more than 0.3% of its weight (Appendix VIII L).

Fluoride Weigh accurately about 13 mg. Carry out the limit test for fluoride (Appendix VIII E). The fluoride content is not less than 14.5% and not more than 15.5%.

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained under the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.45 g, accurately weighed, in 80 ml of methanol, add 10 ml of water and 8-9 drops of phenol red IS (dissolve 0.1 g phenol red in 1.4 ml of 0.2 mol/L sodium hydroxide solution and 5 ml of 90% ethanol, slightly warm to dissolve diflunisal, add 20% ethanol to 250 ml), titrate with sodium hydroxide (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of sodium hydroxide (0.1 mol/L) VS is equivalent to 25.02 mg of $C_{13}H_8F_2O_3$.

Category Non-steroid anti-inflammatory drug.

Storage Preserve in tightly closed containers, protected from light.

Preparation Diflunisal capsules

Diflunisal Capsules

Diflunisal capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Diflunisal ($C_{13}H_8F_2O_3$).

Description Capsules contain white or almost white fine granules.

Identification (1) Shake a quantity of the contents of the capsules, equivalent to about 2 mg of diflunisal, with 10 ml of ethanol, add 1 drop of ferric chloride TS, a dark purple colour is produced.

(2) Dilute a quantity of the test solution obtained under the Assay with 0.1 mol/L hydrochloric acid solution in ethanol to produce a solution of about 20 µg per ml. The light absorption of the resulting solution exhibits two maxima at 251 nm and 315 nm (Appendix IV A).

(3) Take a quantity of the contents, equivalent to about 5 mg of diflunisal, add 5 ml of methanol to dissolve diflunisal with shaking, filter and take the filtrate as test solution. To a quantity of diflunisal CRS, dissolve in methanol to produce a solution of 10 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica GF₂₅₄ as the coating substance and a mixture of carbon tetrachloride-acetone-glacial acetic acid (20:2:1) as the mobile phase. Apply separately to the plate 5 µl each of above two solutions. After developing and removal of the plate, dry it in air and examine under ultra-violet at 254 nm. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

Dissolution Carry out the method for dissolution test (Appendix X C, method 2), using 900 ml of 0.1 mol/L trihydroxymethylaminomethane BS (Dissolve 121 g of trihydroxymethylaminomethane in 9000 ml of water, adjust to pH 7.2 with 25% citric acid solution, dilute to 10000 ml with water) as the dissolution medium and adjust the rotation speed of the basket to 50 rpm. Withdraw 10 ml of

the solution at exact 30 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with dissolution medium to produce a solution of about 30 µg per ml as test solution. Dissolve diflunisal CRS in dissolution medium to produce a solution of about 30 µg per ml as reference solution. Measure the absorbances of the two resulting solutions at 306 nm (Appendix IV A). Calculate the dissolution of $C_{13}H_8F_2O_3$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Triturate the mixed contents obtained under the test for Weight variation. Weigh accurately a quantity, equivalent to about 0.1 g of diflunisal, transfer to a 100 ml volumetric flask, add a quantity of 0.1 mol/L of hydrochloric acid in ethanol, treated with ultrasonicator for 10 minutes to dissolve diflunisal, cool to room temperature, dilute to volume with the same solution, shake thoroughly and filter. Transfer accurately 5 ml of the successive filtrate to a 100 ml volumetric flask, add 0.1 mol/L of hydrochloric acid in ethanol to volume and mix well as test solution. Measure the absorbance of the resulting solution at 315 nm (Appendix IV A). Dissolve a quantity of diflunisal CRS, accurately weighed, in 0.1 mol/L of hydrochloric acid in ethanol to produce a solution of 50 µg per ml, measure the absorbance in the same manner. Calculate the content of $C_{13}H_8F_2O_3$.

Category As described under Diflunisal.

Strength 0.25 g

Storage Preserve in tightly closed containers.

Digitoxin

$C_{41}H_{64}O_{13}$ 764.95

[71-63-6]

Digitoxin is 3β - [(O - 2,6 - dideoxy - β - D - ribo - hexopyranosyl - (1→4) - O - 2,6 - dideoxy - β - D - ribo - hexopyranosyl - (1→4) - 2,6 - dideoxy - β - D - ribo - hexopyranosyl) oxy] - 14β - hydroxy - 5β - card - 20 (22) - enolide. It contains not less than 90.0% of $C_{41}H_{64}O_{13}$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless.

Sparingly soluble in chloroform; slightly soluble in ethanol or ether; insoluble in water.

Identification Dissolve about 1 mg in a test tube with 2 ml of glacial acetic acid containing ferric chloride (to 10 ml of glacial acetic acid add 1 drop of ferric chloride TS), add slowly alongside the test tube wall 2 ml of sulfuric acid to form a subjacent layer, a brown ring develops at the interface and a pale green, then blue, colour passes to the

glacial acetic acid layer.

Clarity of chloroform solution To 0.10 g in a cylinder with stopper add 5 ml of chloroform, shake for 10 minutes and allow to stand for 1 hour, the solution is clear.

Digitonin Dissolve 10 mg in 2 ml of ethanol, add 2 ml of a solution of cholesterol in ethanol (1→200), shake gently, no precipitate is formed in 10 minutes.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Reference preparation Weigh accurately a quantity of digitoxin CRS previously dried to constant weight at 105°C, add a mixture of benzene* (Add a quantity of water to redistilled benzene of reagent grade, shake until saturated, separate the benzene layer.)-chloroform (4:1) to produce a solution of 40 µg per ml.

Chromatographic column Select a chromatographic tube about 200 mm long and about 25 mm in internal diameter. Insert a layer of purified cotton wool. Mix 1 ml of water with 2 g of purified kieselguhr (boil 150 g of chromatographic kieselguhr in 1000 ml of dilute hydrochloric acid for 10 minutes, cool and filter, wash thoroughly with water until the washing is neutral to pH test paper, dry at 105°C and ignite at 500°C for 2 hours and cool), transfer the mixture to the chromatographic tube in divided quantities and tamp lightly each time with a flat head glass rod. Mix 3 g of purified kieselguhr with a mixture of 2 ml of formamide and 1 ml of water and transfer to the chromatographic tube in similar manner. Cover with a pledget of purified cotton wool and tamp lightly.

Procedure Dissolve about 10 mg, accurately weighed, in 10 ml of chloroform in a 50 ml volumetric flask, dilute with benzene* to volume, mix well. Transfer 10 ml, accurately measured, to the prepared chromatographic column and elute with a mixture of benzene*-chloroform (3:1) at a rate not exceeding 4 ml per minute. Collect nearly 250 ml of eluate in a 250 ml volumetric flask, stop the elution, add chloroform to volume and mix well.

Transfer accurately 25 ml of the eluate and 5 ml of the Reference re aration to two conical flasks res ectivel , evaporate each to dryness on a water bath. To each residue add 0.5 ml of ethanol, evaporate to dryness and cool. To each flask add 5 ml of ethanol, insert the stoppers tightly and allow to stand at 22-25°C for 15 minutes, shaking frequently. Add accurately to each flask 3 ml of freshly prepared alkaline trinitrophenol TS, mix well and allow to stand at 22-25°C for 30 minutes, measure separately the absorbances at 495 nm (Appendix IV B). Calculate the content of digitoxin.

Category Cardiotonic glycoside.

St—g Preserve in tightly closed containers.

Preparation Digitoxin Tablets

Digitoxin Tablets

Digitoxin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of digitoxin ($C_{41}H_{64}O_{13}$).

Description White tablets.

Identification To a quantity of the powdered tablets equivalent to about 1 mg of digitoxin in a cylinder with stopper, add 5 ml of chloroform and insert the stopper, shake occasionally, filter. Evaporate the filtrate to dryness

on a water bath, the residue complies with test for Identification described under Digitoxin.

Content uniformity To 1 tablet in a 25 ml volumetric flask add 15 ml of methanol-water (1:1), carry out the procedure described under Assay, beginning at the words "shake for 1 hour to dissolve digitoxin..." and calculate the content of $C_{41}H_{64}O_{13}$. The limit of content deviation is $\pm 20\%$. The results comply with the requirements. (Appendix X E).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets. To a quantity of the powder equivalent to about 0.4 mg of digitoxin, accurately weighed, in a 100 ml volumetric flask, add 60 ml of methanol-water (1:1), shake for 1 hour, dilute with methanol-water (1:1) to volume, mix well. Filter through a membrane filter with a porosity not greater than 0.8 µm, discard the initial filtrate, take the successive filtrate as test preparation. Dissolve a quantity of digitoxin CRS, accurately weighed, in a mixture of methanol-water (1:1) to produce a solution of 4 µg per ml and use it as reference preparation. Measure accurately 1 ml each of the solutions to two 10 ml volumetric flasks. To each flask add 3 ml of a 0.1% ascorbic acid solution in methanol and 0.2 ml of hydrogen peroxide (0.009 mol/L) VS (standardized immediately before use), mix well after addition of each reagent. Add hydrochloric acid to volume, mix well and allow to stand for exact 30 minutes. Measure the fluorescence of the two solutions (Appendix IV E), at an excitation wavelength of 400 nm and an emission wavelength of 565 nm and calculate the content of $C_{41}H_{64}O_{13}$.

Category As described under Digitoxin.

Strength 0.1 mg

Storage Preserve in tightly closed containers.

Digoxin

$C_{41}H_{64}O_{14}$ 780.95

[20830-75-5]

Digoxin is 3-[(O-2,6-dideoxy-β-D-ribohexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribohexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribohexopyranosyl)oxy]-12β, 14β-dihydroxy-5β-card-20(22)-enolide. It contains not less than 95.0% of $C_{41}H_{64}O_{14}$, calculated on the dried basis.

Description White crystals or a crystalline powder; odourless; taste, bitter. Freely soluble in pyridine; slightly soluble in dilute ethanol; very slightly soluble in chloroform; insoluble in water or ether.

Specific optical rotation +9.5° to +12.0°, in a solution of

20 mg per ml in pyridine (Appendix VI E).

Identification (1) Dissolve about 1 mg in 1 ml of glacial acetic acid containing ferric chloride (to 10 ml of glacial acetic acid add 1 drop of ferric chloride TS), add slowly along the wall of test tube 1 ml of sulfuric acid to form two layers; a brown ring is formed at the junction of the liquids and the upper layer acquires an indigo colour on standing.

(2) Dissolve separately the substance being examined and digoxin CRS in methanol-chloroform (1:1) to produce two solutions of 2.5 mg per ml. Carry out the method for ascending paper chromatography (Appendix V A), apply separately 10 μ l each of the two solutions to the paper, previously soaked in a freshly prepared formamide-acetone (3:7) solution for more than 5 minutes and dried before use; using a freshly prepared saturated solution of formamide in chloroform (mix 25 volumes of chloroform and 1 volume of formamide, shake thoroughly, allow to stand, separate the chloroform layer and filter through cotton wool) as the mobile phase. After developing and removal of the paper, dry it at 100°C and examine under ultraviolet light at 365 nm, no spot is obtained in the chromatogram; spray with freshly prepared trichloroacetic acid solution in chloroform (dissolve 6 g of trichloroacetic acid in 25 ml of chloroform, add 0.5 ml of 30% hydrogen peroxide solution, mix well), dry it again at 100°C and cool. Examine under ultraviolet light at 365 nm, the principal spot in the chromatogram obtained with the substance being examined corresponds in both fluorescence and position to that of the principal spot obtained with digoxin CRS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of digoxin (Appendix XVI).

Clarity of solution A solution of 0.50% (w/v) in methanol-chloroform (1:1) is clear.

Related substances Dissolve a quantity of the substance being examined with dilute ethanol to produce a solution of 1 mg per ml as the test solution. Transfer 2 ml of the test solution, accurately measured, into 100 ml volumetric flask, dilute with dilute ethanol to volume, mix well as the reference solution (1). Dissolve an accurately weighed quantity of digitoxin CRS with dilute ethanol to produce a solution of 0.02 mg per ml as the reference solution (2). Carry out the method described under Assay. Inject 20 μ l of the reference solution (1) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% full scale of the chart. Inject separately 20 μ l each of solutions, accurately measured, into column, and record the chromatogram for three times the retention time of the principal peak. If the peak appeared which the retention time is identical with that of the peak of digitoxin in the test solution chromatogram, calculate the content of digitoxin with respect to the peak area obtained in the chromatogram by the external standard method. The content of digitoxin is not more than 2.0%. The area of any peak other than the principal and solvent peak obtained with test solution is not more than the area of the principal peak in the chromatogram obtained with reference solution (1). The sum of the area of all peaks other than the principal peak obtained with test solution is not greater than the twice of the area of the principal peak in the chromatogram obtained with reference solution (1).

Loss on drying When dried in vacuum at 105°C for 1 hour, loses not more than 1.0% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (10:90) as the mobile phase A, a mixture of acetonitrile-water (60:40) as the mobile phase

B. The flow rate is 1.5 ml/min and detection wavelength is 230 nm. The number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of digoxin.

Time (minute)	mobile phase A	mobile phase B
0	60%	40%
5	60%	40%
15	0%	100%
15.1	60%	40%
20	60%	40%

Procedure Dissolve an accurately weighed quantity of the substance being examined with dilute ethanol to produce a solution of 0.1 mg per ml as the test solution. Inject accurately 20 μ l of the resulting solution into the column. Repeat the operation, using digoxin CRS instead of the substance being examined. Calculate the content of $C_{41}H_{64}O_{14}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Cardiotonic.

Storage Preserve in tightly closed containers.

Preparation (1) Digoxin Injection (2) Digoxin Tablets

Digoxin Injection

Digoxin Injection is a sterile solution of digoxin in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of digoxin ($C_{41}H_{64}O_{14}$).

Description A clear, colourless or almost colourless liquid.

Identification (1) Mix 1 ml of the injection with 1 ml of glacial acetic acid containing ferric chloride (to 10 ml of glacial acetic acid add 1 drop of ferric chloride TS) in a small test tube and add slowly along the wall of test tube, 1 ml of sulfuric acid to form two layers, a brown ring is formed at the junction of the liquids, and the upper layer acquires an indigo colour on standing.

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of digoxin CRS.

pH value 6.5-7.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of acetonitrile-water (32:68) as the mobile phase. Maintain the column temperature at 30°C, detection wavelength is 230 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of digoxin.

Procedure Transfer accurately 2 ml of the injection equivalent to 0.5 mg of digoxin to a 5 ml volumetric flask. Dilute to volume with dilute ethanol, mix well. Inject accurately 20 μ l into the column. Dissolve an accurately weighed quantity of digoxin CRS with dilute ethanol, dilute to produce a solution of about 0.1 mg per ml. Repeat the operation. Calculate the content of $C_{41}H_{64}O_{14}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Digoxin.

Strength 2 ml : 0.5 mg

Storage Preserve in well closed containers, protected from light.

Digoxin Tablets

Digoxin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of digoxin ($C_{41}H_{64}O_{14}$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.25 mg of digoxin add 10 ml of glacial acetic acid containing ferric chloride (to 10 ml of glacial acetic acid add 1 drop of ferric chloride TS). Shake for a few minutes, filter through a sintered glass filter. To the filtrate add slowly, along the wall of test tube, 1 ml of sulfuric acid to form two layers; a brown ring is formed at the junction of the liquids and the upper layer acquires an indigo colour on standing.

(2) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of digoxin CRS.

Content uniformity Shake 1 tablet with 10 ml of water in a 25 ml volumetric flask to disintegrate. Add 10 ml of ethanol, make digoxin dissolve for 30 minutes, by ultrasonic generator. Dilute with dilute ethanol to volume and mix well. Filter through a filter membrane with a porosity not greater than $0.45 \mu\text{m}$. Discard the initial filtrate, using the successive filtrate as the test preparation. Weigh accurately a quantity of digoxin CRS, add dilute ethanol to produce a solution of $10 \mu\text{g}$ per ml as the reference preparation. Complete the procedure described under Assay. Calculate the content of $C_{41}H_{64}O_{14}$ of each tablet. The limit of content variation is $\pm 20\%$. The results comply with the requirements (Appendix X E).

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of the solution (to 6 ml of dilute hydrochloric acid add water to produce 250 ml) as the dissolution medium, adjust the rotational speed of the paddle to 100 rpm. Withdraw the solution at exact 60 minutes and filter through a filter membrane with a porosity not greater than $0.45 \mu\text{m}$, use the successive filtrate as the test solution. Dissolve an accurately weighed quantity of digoxin CRS in 50 ml volumetric flask with 80% ethanol, dilute to volume with the dissolution medium to produce a solution of $1 \mu\text{g}$ per ml as the reference solution. Transfer accurately 1 ml each of the test solution and the reference solution to a 10 ml volumetric flask, add 3 ml of 0.1% ascorbic acid solution in methanol, 0.20 ml of hydrogen peroxide (0.009 mol/L) VS (standardized immediately before use), shake after each addition, then add dilute hydrochloric acid to volume and mix well. Allow to stand in the dark at 30°C for 2 hours and immediately carry out the method for Fluorometry (Appendix IV E). Measure the fluorescence of the two solution using an excitation wavelength of 360 nm and an emission wavelength of 485 nm. Calculate the dissolution of $C_{41}H_{64}O_{14}$ from each tablet, not less than 65% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of

acetonitrile-water (32:68) as the mobile phase. Maintain the column temperature at 30°C , detection wavelength is 230 nm. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of digoxin.

Procedure Weigh accurately and powder 20 tablets, weigh accurately a quantity of powder equivalent to 2.5 mg of digoxin in a 25 ml volumetric flask. To make digoxin dissolved for 30 minutes by ultrasonic generator, and cool, dilute to volume with ethanol, mix well and filter membrane with a porosity not greater than $0.45 \mu\text{m}$. Inject accurately $20 \mu\text{l}$ of the successive filtrate into the column. Dissolve an accurately weighed quantity of digoxin CRS with dilute ethanol, dilute to produce a solution of 0.1 mg per ml. Repeat the operation, Calculate the content of $C_{41}H_{64}O_{14}$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Digoxin.

Strength 0.25 mg

Storage Preserve in tightly closed containers.

Dihydralazine Sulfate

$C_8H_{10}N_6 \cdot H_2SO_4 \cdot 2\frac{1}{2}H_2O$ 333.32 [484-23-1]

Dihydralazine Sulfate is 1,4-dihydrazinophthalazine sulfate hemipentahydrate. It contains not less than 98.0% of $C_8H_{10}N_6 \cdot H_2SO_4$, calculated on the dried basis.

Description A white to pale yellow crystalline powder, and the anhydrous base is yellow powder; odourless; taste, slightly bitter.

Sparingly soluble in boiled water; slightly soluble in water or ethanol.

Melting range $241-245^\circ\text{C}$, with decomposition (Appendix VI C).

Identification (1) Filter the solution obtained under the Assay finished, wash the precipitate with water and dry it at 105°C , the melting range is $150-156^\circ\text{C}$ (Appendix VI C).

(2) To the saturated aqueous solution add alkaline mercuric potassium iodide TS, a brownish black precipitate is produced. To another portion of the solution add ferric chloride TS, a blue colour is produced.

(3) The saturated aqueous solution yields the reaction characteristic of sulfates (Appendix III).

Free hydrazine Dissolve 2.0 mg in water to produce a solution of 0.4 mg per ml. To 5 ml of the solution add 4 ml of freshly prepared *p*-dimethylaminobenzaldehyde solution (dissolve 0.2 g of *p*-dimethylaminobenzaldehyde in a mixture of 60 ml of hydrochloric acid and 40 ml of water), allow to stand for 3 minutes. Measure the absorbance of the resulting solution at 450 nm; not more than 0.05 (Appendix IV A).

Loss on drying When dried in vacuum to constant weight at 80°C , loses not more than 12.0%-15.0% (Appendix VIII

L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.3 g, accurately weighed, in 50 ml of water and 10 ml of hydrochloric acid solution (1→2) by gently heating, cool to room temperature. Carry out the method for dead-stop titration (Appendix VII A), titrate with sodium nitrite (0.1 mol/L) VS. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 14.41 mg of $C_8H_{10}N_6 \cdot H_2SO_4$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Dihydralazine Sulfate Tablets

Dihydralazine Sulfate Tablets

Dihydralazine Sulfate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dihydralazine sulfate ($C_8H_{10}N_6 \cdot H_2SO_4$).

Description Sugar-coating tablets with white to pale yellow core.

Identification (1) Powder the tablets with the sugar coating removed. To a quantity of the powdered tablets equivalent to about 25 mg of dihydralazine sulfate add 20 ml of water, shake well and filter. The filtrate complies with tests (2), (3) for Identification described under Dihydralazine Sulfate.

(2) To a quantity of the powdered tablets obtained under the identification (1) equivalent to about 50 mg of dihydralazine sulfate add 20 ml of water and 3 ml of dilute hydrochloric acid, shake and filter. To the filtrate add an excess of sodium nitrite solution (0.1 mol/L), a precipitate is produced. Filter, wash the precipitate with water and dry at 105°C, it melts in a range of 148-156°C.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 40 tablets. Weigh accurately a quantity of the powdered tablets equivalent to about 0.2 g of dihydralazine sulfate. Carry out the method for the Assay described under Dihydralazine Sulfate. Each ml of sodium nitrite (0.1 mol/L) VS is equivalent to 14.41 mg $C_8H_{10}N_6 \cdot H_2SO_4$.

Category, Storage As described under Dihydralazine Sulfate.

Strength (1) 12.5 mg (2) 25 mg

Dihydroartemisinin

$C_{15}H_{24}O_5$ 284.35

Dihydroartemisinin is (3R, 5 α S, 6R, 8 α S, 9R, 12S, 12 α R) - octahydro - 3,6,9 - trimethyl - 3,12 - epoxy-12H-pyrano [4,3-j]-1,2-benzodioxepin-10 (3H)-ol. It contains not less than 98.0% and not more than 102.0% of $C_{15}H_{24}O_5$, calculated on the dried basis.

Description White needle crystals; odourless; taste, bitter. Freely soluble in chloroform; soluble in acetone; sparingly soluble in methanol or ethanol; practically insoluble in water.

Melting range 145-150°C, with decomposition (Appendix VI C).

Identification (1) Dissolve about 10 mg of dihydroartemisinin in 1 ml of dehydrated ethanol, add 2 ml of potassium iodide TS and 4 ml of dilute sulfuric acid TS, mix well, add a few drops of starch IS; a bluish purple colour is produced.

(2) To 3-4 drops of dihydroartemisinin in chloroform solution (1→10), previously volatilizing completely the chloroform, add 1 drop of a solution of 2% vanillin in sulfuric acid; a red colour is produced which changes gradually to brown on standing.

(3) A solution of 20 mg per ml in chloroform is dextrorotatory (Appendix VI E).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dihydroartemisinin (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate (8:2) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in chloroform containing (1) 20 mg per ml (2) 0.4 mg per ml of the substance being examined. After developing and removal of the plate, allow it to dry in air, spray with a solution of 2% vanillin in sulfuric acid. Not more than a secondary spot is obtained in the chromatogram obtained with solution (1) and no secondary spot is more intense than the principal spot obtained with solution (2) (2%).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 10 mg of dihydroartemisinin, accurately weighed, in ethanol in a 50 ml volumetric flask, dilute with ethanol to volume, mix well and allow to stand for 2 hours, as the test solution. Dissolve about 10 mg, accurately weighed, of dihydroartemisinin CRS, in ethanol in a 50 ml volumetric flask and dilute with ethanol to volume. Mix well and allow to stand for 2 hours as the reference solution.

To 1 ml of each of the two solutions, accurately measured, to 10 ml of 2% sodium hydroxide solution and mix well. Dilute with 2% sodium hydroxide solution to volume, mix well, warm the two solutions in a water bath at 60°C for 30 minutes and cool to room temperature. Use a mixture of 2% sodium hydroxide solution-ethanol (4:1) as a blank and measure the absorbances of the resulting solutions at 238 nm (Appendix IV A). Calculate the content of $C_{15}H_{24}O_5$.

Category Antimalarial.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Dihydroartemisinin Tablets

Dihydroartemisinin Tablets

Dihydroartemisinin Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dihydroartemisinin ($C_{15}H_{24}O_5$).

Description White tablets.

Identification (1) Dissolve a quantity of the powdered tablets equivalent to about 20 mg of dihydroartemisinin in 2 ml of dehydrated ethanol and filter. To the filtrate add 2 ml of potassium iodide TS and 4 ml of dilute sulfuric acid TS, mix well, add a few drops of starch IS; a bluish-purple colour is produced.

(2) To a quantity of the powdered tablets equivalent to about 20 mg of dihydroartemisinin add 10 ml of chloroform, shake to dissolve dihydroartemisinin and filter. Evaporate the filtrate to about 2 ml and use the solution as the test solution. Dissolve dihydroartemisinin CRS in chloroform to produce a solution of 10 mg per ml as reference solution. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate (8:2) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, dry it in air and spray with a solution of 2% vanillin in sulfuric acid. The colour and position of the principal spot in the chromatogram obtained with the test solution corresponds to the principal spot in the chromatogram obtained with reference solution.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ethyl acetate (8:2) as the mobile phase. Apply to the plate 10 μ l each of two solutions in chloroform containing (1) 20 mg per ml (2) 0.6 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air, spray with a solution of 2% vanillin in sulfuric acid. Not more than a secondary spot in the chromatogram is obtained with solution (1), and no secondary spot is more intense than the principal spot obtained with solution (2) (3%).

Dissolution Carry out the dissolution test (Appendix X C, method 3), using 250 ml of a mixture of 0.15% sodium hydroxide solution-ethanol (4:1) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 5 ml of the solution at exact 30 minutes and filter. Transfer accurately 2 ml of the successive filtrate, to a 10 ml volumetric flask, dilute with 2% sodium hydroxide solution to volume and use this solution as the test solution. Dissolve a quantity of dihydroartemisinin CRS in ethanol to produce a solution of about 0.4 mg per ml and allow it to stand for 2 hours. Transfer accurately 2 ml of the solution in a 10 ml volumetric flask, dilute with 0.15% sodium hydroxide solution to volume, warm the solution in water bath at 37°C for 30 minutes and dilute 2 ml of the solution, accurately measured, with 2% sodium hydroxide solution to 10 ml as the reference solution. Warm the two solutions in water bath at 60°C for 30 minutes, cool to room temperature. Measure the absorbances of the resulting solutions at 241 nm (Appendix IV A). Calculate the dissolution of $C_{15}H_{24}O_5$ form each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirement

for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Transfer an accurately weighed quantity of the powder equivalent to about 10 mg of dihydroartemisinin to a 50 ml volumetric flask, add a quantity of ethanol, shake to dissolve dihydroartemisinin, dilute with ethanol to volume and mix well. Allow it to stand for 2 hours, filter and use the successive filtrate, as the test solution. Dissolve about 10 mg of dihydroartemisinin CRS, accurately weighed, in ethanol in a 50 ml volumetric flask and dilute with ethanol to volume. Mix well and allow it to stand for 2 hours, as the reference solution.

To 1 ml of each of the two solutions, accurately measured, in two 10 ml volumetric flasks add accurately 1 ml of ethanol, mix well, dilute with 2% sodium hydroxide solution and mix well. Warm the solutions in a water bath at 60°C for 30 minutes, cool to room temperature. Use a mixture of 2% sodium hydroxide solution-ethanol (4:1) as a blank and measure the absorbances of the resulting solutions at 238 nm (Appendix IV A). Calculate the content of $C_{15}H_{24}O_5$.

Category As described under Dihydroartemisinin.

Strength 20 mg

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Diltiazem Hydrochloride

$C_{22}H_{26}N_2O_4S \cdot HCl$ 450.99

[33286-22-5]

Diltiazem Hydrochloride is (+) - cis - 5 - [2-(dimethylamino) ethyl]-2-(4-methoxyphenyl)-3-(acetoxy) - 2,3 - dihydro - 1,5-benzothiazepin-4 (5H)-one Hydrochloride. It contains not less than 98.5% of $C_{22}H_{26}N_2O_4S \cdot HCl$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; taste, bitter. Freely soluble in water, methanol or chloroform; practically insoluble in ether or benzene.

Melting range 210-215°C, with decomposition (Appendix VI C).

Specific optical rotation +115° to +120°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) Dissolve about 50 mg in 1 ml of hydrochloric acid solution (9→100), add 1 ml of ammonium thiocyanate TS, 1 ml of 2.8% cobaltous nitrate solution and 5 ml of chloroform, shake thoroughly. Allow to stand, a blue colour is produced in the chloroform layer.

(2) The light absorption of a 10 μ g per ml solution in hydrochloric acid solution (0.01 mol/L) exhibits a maximum at 236 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diltiazem hydrochloride (Appendix XVI).

(4) Carry out the method of Oxygen flask combustion (Appendix VII C), using about 30 mg, with 20 ml of water as absorbing liquid. The solution yields the reaction characteristic of sulfates (Appendix III).

(5) The aqueous solution yields the reaction characteristic of chlorides (Appendix III).

Acidity Dissolve 0.20 g in 20 ml of water, pH 4.3-5.3 (Appendix VI H).

Clarity of solution Dissolve 1.0 g in 20 ml of water, the solution is clear.

Sulfate Carry out the limit test for sulfates (Appendix VII B), using 1.0 g. Any opalescence produced is not more intense than that of a reference using 2.4 ml of potassium sulfate standard solution (0.024%).

Related substances Carry out the method described under the Assay of Diltiazem Hydrochloride Tablets. Dissolve the substance being examined in the mobile phase to produce a solution of (1) 1.0 mg per ml, (2) 5.0 µg per ml. Carry out the method described under Assay for Diltiazem Hydrochloride Tablets. Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height is about 20% of the full scale of the chart. Inject separately 20 µl each of solution (1) and (2) into the column, record the chromatogram for twice the retention time of the principal peak; the sum of peak areas of the solution (1) due to impurities is not greater than that of the principal peak area of the solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII N, method 2), using 2.0 g; not more than 0.001%.

Arsenic To 1.0 g in a 100 ml Kjeldahl flask add 5 ml of nitric acid and 2 ml of sulfuric acid, cover the mouth of the flask with a small funnel, heat cautiously until white fumes are evolved. Cool, add 2 ml of nitric acid and heat again, repeat the addition of nitric acid and heating once more, then add 2 ml of strong hydrogen peroxide solution and heat, repeat the addition of hydrogen peroxide solution and heating until the solution is colourless or faintly yellowish. Cool, add 2 ml of saturated ammonium oxalate solution, heat until white fumes are evolved again. Cool, add water to 5 ml and carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.3 g, accurately weighed, in 2 ml of anhydrous formic acid, add 30 ml of acetic anhydride, 5 ml of mercuric acetate TS and 2 drops of naphtholbenzein IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 45.10 mg of $C_{22}H_{26}N_2O_4S \cdot HCl$.

Category Calcium channel blocker.

Storage Preserve in tightly closed containers, protected from light.

Preparation Diltiazem Hydrochloride Tablets

Diltiazem Hydrochloride Tablets

Diltiazem Hydrochloride Tablets contain not less

than 93.0% and not more than 107.0% of the labelled amount of diltiazem hydrochloride ($C_{22}H_{26}N_2O_4S \cdot HCl$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to 60 mg of diltiazem hydrochloride, add 10 ml of hydrochloric acid solution (9→100), shake thoroughly to dissolve diltiazem hydrochloride and filter. The filtrate complies with test (1) for Identification described under Diltiazem Hydrochloride.

(2) Dilute 1 ml of the filtrate obtained in the test for Identification (1) with water to 500 ml, mix well. The light absorption of the solution exhibits a maximum at 236 nm (Appendix IV A).

(3) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is concordant with that of diltiazem hydrochloride CRS.

Related substances Dissolve the substance being examined in ethanol to produce solutions of (1) 1.0 mg per ml, (2) 5.0 µg per ml. Carry out the method described under Assay. Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height is 20% of the full scale of the chart. Inject separately 20 µl each of solution (1) and (2) into the column, record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak obtained with solution (1) is not greater than twice of the area of the principal peak obtained with solution (2).

Content uniformity Comply with the requirements (Appendix X E). Dissolve 1 tablet in a 100 ml volumetric flask in 50 ml of ethanol with ultrasonic treatment, dilute to volume with ethanol and mix well. Filter, dilute a quantity of the successive filtrate, accurately measured, with ethanol to produce a solution of 0.1 mg per ml as test solution. Carry out the method described under Assay using the resulting solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 75 rpm. Withdraw 10 ml of the solution at exact 30 minutes and 180 minutes respectively and add immediately 10 ml of the water to the vessel to compensate the volume. Filter and dilute the successive filtrate with water as the test solution, to produce two solutions of 8 µg per ml respectively. Dissolve a quantity of diltiazem hydrochloride CRS, in water to produce a solution of 8 µg per ml and use it as the reference solution. Measure the absorbance of the solutions at 240 nm separately (Appendix IV A), calculate the dissolution of diltiazem hydrochloride each tablet for 6 tablets. The amount of diltiazem hydrochloride dissolved in 30 minutes not more than 60% and in 180 minutes not less than 80%.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column of octadecylsilane bonded silica gel and a mixture of buffer solution (Dissolve 1.16 g of *d*-Camphor sulfonic acid in 0.01 mol/L sodium acetate solution and dilute to 1000 ml, adjust pH to 6.2 with 0.01 mol/L sodium hydroxide solution)-acetonitrile-methanol (50 : 25 : 25) as the mobile phase. Detection wavelength is 240 nm and the number of theoretical plates is not less than 1200; calculated with reference to diltiazem.

Procedure Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to 10 mg of diltiazem hydrochloride in a 100 ml volumetric flask,

add 50 ml of ethanol, dissolve diltiazem hydrochloride with ultrasonic treatment for 10 minutes, Dilute to volume with ethanol, mix well and filter. Inject 20 μ l of the successive filtrate into the column and record the chromatogram. Dissolve a quantity of accurately weighed diltiazem hydrochloride CRS in ethanol and dilute to produce a solution of about 0.10 mg per ml. Inject 20 μ l of the resulting solution into the column and calculate the content of $C_{22}H_{26}N_2O_4S \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Diltiazem Hydrochloride.

Strength (1) 30 mg (2) 45 mg (3) 60 mg
(4) 90 mg (5) 120 mg

Storage Preserve in tightly closed containers, protected from light.

Dimenhydrinate

$C_{24}H_{28}ClN_5O_3$ 469.97

[523-87-5]

Dimenhydrinate is 8-chloro-3,7-dihydro-1,3-dimethyl-1H-purine-2,6-dione, compound with 2-(diphenylmethoxy)-N,N-dimethylethanamine (1 : 1). It contains not less than 53.0% and not more than 55.5% of diphenhydramine ($C_{17}H_{21}NO$), and not less than 44.0% and not more than 47.0% of 8-chlorotheophylline ($C_7H_7ClN_4O_2$), calculated on the dried basis.

Description A white, crystalline powder; odourless. Freely soluble in ethanol or chloroform; slightly soluble in water or ether.

Melting range 102-107°C (Appendix VI C).

Identification (1) Dissolve about 0.2 g in 15 ml of dilute ethanol in a separator, add a mixture of 15 ml of water and 2 ml of concentrated ammonia solution and extract with 20 ml of ether. Wash the extract with 5 ml of water, discard the water layer. To the ether layer add 5 ml of dilute hydrochloric acid, shake well and allow to stand. Separate the acid layer, expel the residual ether with a current of air. Add 10 ml of water and add dropwise trinitrophenol TS with vigorous stirring until crystallisation is complete, filter. The crystals, after recrystallisation from ethanol and dried at 80°C for 30 minutes, melt at 128-132°C (Appendix VI C). (2) To 0.1 g add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, and evaporate to dryness on a water bath. Add a few drops of ammonia TS to the residue, a purple colour is produced.

(3) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of dimenhydrinate (Appendix XVI)

Related Substances Carry out the method for high performance liquid Chromatography (Appendix X D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-triethylamine BS (1:1) as mobile phase. Detection wavelength is 225 nm, and the number of theoretical plates of the column is not less than 2000,

calculated with reference to the peaks of diphenhydramine. Dissolve a quantity of substance being examined in mobile phase to produce two solutions of 0.4 mg per ml (test solution) and 6 μ g per ml (reference solution), respectively. Inject 10 μ l of the reference solution into the column, adjust the attenuation so that the height of the peak corresponding 8-chlorotheophylline is not less than 10% of the full scale of the chart. Inject separately 10 μ l each of the test solution and the reference solution, both accurately measured, into the column, record the chromatogram for twice the retention time of principal peak of diphenylhydramine. The sum of peak areas due to the impurities is not greater than the principal peak area of the reference solution.

Chloride To 0.30 g in a 200 ml volumetric flask add 50 ml of water, 3 ml of ammonia TS and 6 ml of 10% ammonium nitrate solution and heat on a water bath for 5 minutes. Add accurately 25 ml of silver nitrate (0.1 mol/L) VS, shake well and heat again on a water bath for 15 minutes with frequent shaking. Cool, dilute with water to volume, mix well and allow to stand for 15 minutes. Filter the solution with a piece of dry filter paper and discard the initial filtrate. To 25 ml of the successive filtrate in a 50 ml Nessler cylinder and 10 ml of dilute nitric acid and dilute with water to 50 ml, mix well. Allow the solution to stand in the dark place for 5 minutes. Carry out the limit test for chlorides (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference using 1.5 ml of sodium chloride standard solution (0.04%).

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in Residue on ignition; not more than 0.001%.

Assay diphenhydramine Dissolve about 0.3 g, accurately weighed, in 15 ml of glacial acetic acid by warming gently. Cool, add 1 drop of crystal violet IS and titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.54 mg of $C_{17}H_{21}NO$.

8-chlorotheophylline To 0.3 g, accurately weighed, in a 200 ml volumetric flask, add 50 ml of water, 3 ml of ammonia TS and 6 ml of 10% ammonium nitrate solution, warm on a water bath for 5 minutes. Add accurately 25 ml of silver nitrate (0.1 mol/L) VS, mix well, and warm on a water bath for 15 minutes with shaking, cool, add water to volume, mix well, and allow to stand for 15 minutes. Filter and discard the initial filtrate. Measure accurately 100 ml of the successive filtrate, acidify with nitric acid, add further 3 ml of nitric acid and 2 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 21.46 mg of $C_7H_7ClN_4O_2$.

Category Antihistamine agent.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation Dimenhydrinate Tablets

Dimenhydrinate Tablets

Dimenhydrinate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dimenhydrinate ($C_{24}H_{28}ClN_5O_3$). The content of 8-chlorotheophylline ($C_7H_7ClN_4O_2$) is not less than 4.4% and not more than 4.9% of the content of dimenhydrinate.

Description White tablets.

Identification (1) Triturate a quantity of the powdered tablets equivalent to about 0.4 g of dimenhydrinate with 40 ml of warm ethanol, filter and evaporate the filtrate to dryness. The residue complies with tests for Identification described under Dimenhydrinate.

(2) In the Assay, the retention time of the two principal peaks in the chromatogram obtained with the test preparation corresponds with that of the two principal peaks in the chromatogram obtained with the reference preparation.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw 10 ml of the solution at exact 45 minutes and filter. Transfer accurately 5 ml of the successive filtrate into a 20 ml (for strength 50 mg) or 10 ml (for strength 25 mg) volumetric flask and dilute with water to volume, shake well. Measure the absorbance at 278 nm (Appendix IV A). Dissolve a quantity of dimenhydrinate CRS, weighed accurately, in water to produce a solution of about 14 µg per ml and measure the absorbance at 278 nm. Calculate the dissolution of $C_{18}H_{20}O_2$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix X D), using a column packed with octadecylsilane bounded silica gel and a mixture of methanol-triethylamine BS (1 : 1) as the mobile phase. Detection wavelength is 225 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of diphenhydramine. The resolution factors between the peaks of 8-chlorotheophylline, internal standard and diphenhydramine comply with the related requirements.

Internal Standard Solution Dissolve about 0.1 g of anisic acid in 10 ml of methanol in a 250 ml volumetric flask and dilute with the mobile phase to volume, mix well.

Procedure Dissolve a quantity of dimenhydrinate CRS, accurately weighed, in the internal standard solution to produce a solution of about 0.4 mg per ml. Inject 5-10 µl into the column. Calculate the response factor, taking 45.7 as the percentage of 8-chlorotheophylline in dimenhydrinate. Weigh accurately and powder 20 tablets. To an accurately weighed quantity of the powder equivalent to about 20 mg of dimenhydrinate in a 50 ml volumetric flask, add a quantity of internal standard solution and subject to ultrasonic treatment. Add internal standard solution to volume, mix well and filter. Discard the initial filtrate and inject 5-10 µl of the successive filtrate into the column. Calculate the content of $C_7H_7ClN_4O_2$ and that of $C_{24}H_{28}ClN_5O_3$ in the tablets.

Category As described under Dimenhydrinate.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers, stored in a dry place.

Dimercaprol

$C_3H_8OS_2$ 124.23

[59-52-9]

Dimercaprol is 2,3-dimercapto-1-propanol. It contains not less than 98.5% (g/g) of $C_3H_8OS_2$.

Description A colourless or almost colourless, mobile, clear liquid; odour, characteristic, alliaceous.

Very soluble in methanol, ethanol or benzyl benzoate; soluble in water; insoluble in fatty oil; miscible with fatty oils when dissolved in benzyl benzoate.

Relative density 1.235-1.255 at 25°C (Appendix VI A).

Identification (1) Mix 1 drop in 2 ml of water, add a few drops of lead acetate TS; a yellow precipitate is produced.

(2) Heat with sodium carbonate; an odour of acrolein is perceptible.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dimercaprol (Appendix XVI).

Stability Heat at 140°C for 2 hours, carry out the procedure described under Assay, loses not more than 4.0% of the content.

Acidity Shake 1.0 g with 10 ml of water to prepare a saturated solution and filter; pH 5.0-7.0 (Appendix VI H).

Bromine Weigh 40 mg on an ashless filter paper, carry out the method for oxygen flask combustion (Appendix VII C), using a mixture of 15 ml of 2.0% sodium hydroxide solution and 15 drops of 30% hydrogen peroxide solution as the absorbing liquid. When the combustion is complete, wash the stopper and the platinum wire with 20 ml of water. Combine the washing with the absorbing liquid, boil for 2 minutes and cool. Transfer the solution to a 50 ml Nessler cylinder, neutralize with nitric acid solution (1→2) and add 2 ml of nitric acid solution in excess. Then add 1.0 ml of silver nitrate TS and water to produce 50 ml, mix well and allow to stand in a dark place for 10 minutes. Any opalescence produced is not more pronounced than that of a reference solution prepared in the same manner, using 4.0 ml of sodium bromide standard solution (dissolve 12.88 mg of sodium bromide in water to produce 1000 ml. Each ml is equivalent to 10 µg of Br) in place of the substance being examined (0.10%).

Assay Mix about 0.1 g, accurately weighed, with 10 ml of ethanol. Titrate with iodine (0.05 mol/L) VS until the solution becomes persistently pale yellow. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 6.211 mg of $C_3H_8OS_2$.

Category Antidote.

Storage Preserve in tightly closed containers, protected from light.

Preparation Dimercaprol Injection

Dimercaprol Injection

Dimercaprol Injection is a sterile solution of dimercaprol in oil. It contains not less than 95.0% and not more than 105.0% of the labelled amount of dimercaprol ($C_3H_8OS_2$).

Benzyl benzoate is added as a solubilizing agent.

Description A clear, colourless to pale yellow, oily liquid.

Identification Shake 0.3 ml with 10 ml of water and add a few drops of lead acetate TS; a yellow precipitate is produced.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer 1 ml, accurately measured with a "to contain" pipet to a conical flask, wash the inner wall of the pipet with 10 ml, in portions, of a mixture of chloroform-dehydrated ethanol (1:3) add the washings to the conical flask and mix well. Titrate with iodine (0.05 mol/L) VS until the solution becomes persistently pale yellow. Perform a blank determination and make any necessary correction. Each ml of iodine (0.05 mol/L) VS is equivalent to 6.211 mg of $C_3H_8OS_2$.

Category As described under Dimercaprol.

Strength (1) 1 ml:0.1 g (2) 2 ml:0.2 g

Storage Preserve in well closed containers, protected from light.

Dimercaptosuccinic Acid

$C_4H_6O_4S_2$ 182.22

[304-55-2]

Dimercaptosuccinic Acid is 2,3-dimercaptosuccinic acid. It contains not less than 98.5% of $C_4H_6O_4S_2$, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; with an odour resembling that of mercapto compound. Slightly soluble in methanol or ethanol; practically insoluble in water or chloroform.

Melting range 190-194°C, with decomposition (Appendix VI C).

Identification (1) To about 0.2 g add 2 ml of water and a quantity of sodium bicarbonate TS to dissolve the substance being examined and make the solution neutral, add 1 ml of lead acetate TS; a pale yellow precipitate is produced.

(2) To about 0.2 g add 2 ml of water and a quantity of sodium hydroxide TS to dissolve the substance being examined and make the solution alkaline, add dropwise sodium nitroprusside TS; a violet-red colour is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dimercaptosuccinic acid (Appendix XVI).

Acidity A suspension of 1.0 g in 20 ml of water, pH 2.5-3.0 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C,

loses not more than 1.0 % of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1 % (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001 %.

Assay Weigh accurately about 0.05 g into a conical flask with stopper, add 30 ml of ethanol to dissolve the substance being examined. Add 2 ml of diluted nitric acid, and 25 ml of silver nitrate (0.1 mol/L) VS, accurately measured, shake vigorously. Heat in a water bath for 2 to 3 minutes, cool, and filter. Wash the conical flask and precipitate with water until the washings yield no reaction characteristic of silver. Combine the filtrate and washings, add 2 ml of nitric acid and 2 ml of ferric ammonium sulfate IS, titrate with ammonium thiocyanate (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 4.556 mg of $C_4H_6O_4S_2$.

Category Antidote.

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Preparation Dimercaptosuccinic Acid Capsules

Dimercaptosuccinic Acid Capsules

Dimercaptosuccinic Acid Capsules contain not less than 90.0 % and not more than 110.0 % of the labelled amount of dimercaptosuccinic acid ($C_4H_6O_4S_2$).

Identification A quantity of the contents of the capsules equivalent to about 200 mg of dimercaptosuccinic acid complies with the test (1) and (2) for Identification described under Dimercaptosuccinic Acid.

Loss on drying The contents of the capsules, when dried to constant weight at 105°C, loses not more than 1.0 % of their weight (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed contents in the test for Weight variation equivalent to about 50 mg of dimercaptosuccinic acid, carry out the method for Assay described under Dimercaptosuccinic Acid. Each ml of silver nitrate (0.1 mol/L) VS is equivalent to 4.556 mg of $C_4H_6O_4S_2$.

Category As described under Dimercaptosuccinic Acid.

Strength 0.25 g

Storage Preserve in tightly closed containers, protected from light and stored in a cool and dry place.

Dimethicone

[9006-65-9]

Dimethicone is a polymer of dimethylsiloxane.

Description A clear, colourless oily liquid; odourless or almost odourless; tasteless. Miscible with chloroform, ether, benzene, toluene or xylene; insoluble in water or ethanol.

Relative density 0.970-0.980 (Appendix VI A).

Refractive index 1.400-1.410 (Appendix VI F).

Viscosity Kinematic viscosity 500-1000 mm²/s, at 25°C (Appendix VI G, method 1, using a capillary tube; 2 mm in internal diameter).

Identification (1) Ignite gently 0.5 g with 0.5 ml each of sulfuric acid and nitric acid in a crucible. A white fibrous matter is formed and finally a white residue is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dimethicone (Appendix XVI).

Acidity or alkalinity Mix 5 ml each of ethanol and chloroform, add 1 drop of phenolphthalein IS, and sodium hydroxide (0.02 mol/L) VS dropwise until a slight pink colour is produced. Add 1.0 g of the substance being examined and mix well. If the solution is colourless, add 0.15 ml of sodium hydroxide (0.02 mol/L) VS, a pink colour is produced; if the colour of the solution is pink, add 0.15 ml of sulfuric acid (0.01 mol/L) VS, the colour disappears.

Loss on drying When dried to constant weight at 150°C for 3 hours, loses not more than 1.0% of its weight (Appendix VIII L).

Category Antifoaming agent.

Storage Preserve in tightly closed containers.

Preparation (1) Dimethicone Aerosol
(2) Dimethicone Tablets

Dimethicone Aerosol

Dimethicone Aerosol contains not less than 80.0% and not more than 120.0% of the labelled amount of dimethicone. The concentration of dimethicone in the liquid is not less than 0.65% (g/g) and not more than 1.00% (g/g).

Description A clear, colourless to pale yellow liquid with an odour resembling that of peppermint.

Identification The oily liquid obtained in the Assay complies with test (2) for Identification described under Dimethicone.

Other requirements Complies with the general requirements for aerosols, powders for spray and preparations for nebulisation except total number of discharge per container, content of active ingredient in a unit spray and deposition of the emitted dose (Appendix I L).

Assay To 3 containers, weigh accurately, punch a small hole on the aluminium cover and insert syringe needle connecting to a rubber tubing, but does not contact the liquid surface. Dip the other end of the tubing in water to expel the propellants slowly. Remove the aluminium covers and transfer the contents of each container separately to 3 evaporating dishes previously dried to constant weight at 110°C with a small quantity of chloroform. Wash each container with 20 ml of chloroform in portions, transfer the washings to the evaporating dish, evaporate on a water bath and dry to constant weight at 110°C, and weigh accurately to calculate the weight of dimethicone in each container. Wash

and dry the container valve and aluminium cover, and weigh accurately to get the weight of the contents of each container. Calculate the concentration of dimethicone in g/g. The results comply with the requirements.

Category As described under Dimethicone.

Strength Total amount of each container, 18 g, containing 0.15 g of dimethicone

Storage Preserve in well closed containers, stored in a dark and cool place.

Dimethicone Tablets

Dimethicone Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dimethicone; not less than 45.0% of the labelled amount of aluminium hydroxide calculated as aluminium oxide (Al₂O₃).

Formula	Dimethicone	50 g
	Aluminium hydroxide	80 g
	Glucose	600 g
	To make	1000 tablets (50 mg) or 2000 tablets (25 mg)

Description White or almost white tablets.

Identification (1) The oily liquid obtained in the Assay complies with tests of Identification described under Dimethicone.

(2) Dissolve a quantity of powdered tablets equivalent to about 0.5 g of aluminium hydroxide with 10 ml of dilute hydrochloric acid by heating and filter. The filtrate yields the reactions characteristic of aluminium salts (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay *Dimethicone* Weigh accurately and powder 20 tablets (50 mg strength) or 40 tablets (25 mg strength). Extract a quantity of the powder equivalent to about 0.2 g of dimethicone with 8 quantities of 15 ml of chloroform. Combine the extracts, filter and wash the residue with chloroform, evaporate the combined filtrate and washing to dryness in a crucible, dried previously at 110°C to constant weight, on a water bath. Dry the residue to constant weight at 110°C and weigh accurately. Calculate the content of dimethicone.

Aluminium oxide To a quantity, accurately weighed, of the above powder equivalent to about 0.4 g of aluminium hydroxide add 10 ml each of hydrochloric acid and water. Heat on a water bath for 5 minutes to produce a solution, allow it to cool and filter. Transfer the filtrate to a 100 ml volumetric flask, wash the residue with water and combine the washings with the filtrate, dilute with water to volume and shake well. Carry out the Assay described under Aluminium Hydroxide, using 20 ml, accurately measured, of the resulting solution, beginning at the words "neutralize with ammonia TS until a precipitate is just produced...". Calculate the content. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 2.549 mg of Al₂O₃.

Category As described under Dimethicone.

Strength (1) 25 mg (2) 50 mg

Storage Preserve in tightly closed containers, stored at dry place.

Dioxopromethazine Hydrochloride

$C_{17}H_{20}N_2O_2S \cdot HCl$ 352.88

Dioxopromethazine Hydrochloride is 10-(2-Dimethylamino-isopropyl) phenothiazine-5, 5-dioxide monohydrochloride. It contains not less than 99.0% of $C_{17}H_{20}N_2O_2S \cdot HCl$, calculated on the dried basis.

Description A white to slightly yellow powder or crystalline powder; odourless; taste, bitter. Soluble in water; very slightly soluble in ethanol.

Specific absorbance Measure the absorbance of a solution of 10 μg per ml in hydrochloric acid solution (0.1 mol/L) at 264 nm (Appendix IV A), the value of A (1%, 1 cm) is 350-370.

Identification (1) The light absorption of a solution of 10 μg per ml in hydrochloric acid (0.1 mol/L) exhibits four maxima at 227 nm, 264 nm, 290.5 nm and 328 nm; the absorbance at 328 nm is 0.15-0.18 (Appendix IV A). (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dioxopromethazine hydrochloride (Appendix XVI). (3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.5 g in 25 ml of water, pH 4.2-5.1 (Appendix VI H).

Clarity and colour of solution Dissolve 0.2 g in 10 ml of water, the solution is clear and colourless or almost clear and colourless.

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.2 g. Any opalescence produced is not more pronounced than that of the reference solution using 3 ml of potassium sulfate standard solution (0.025%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of toluene-acetone-concentrated ammonia solution (70 : 29 : 1) as the mobile phase. Apply separately to the plate 20 μl of each of two solutions in methanol containing (1) 10 mg, (2) 50 μg of the substance being examined per ml. After developing and removal of the plate, dry it in air and examine under ultraviolet light at 254 nm. Any spot, other than the principal spot, in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 25 ml of glacial acetic acid and 10 ml of mercuric acetate TS by warming, cool to room temperature, add 1-2 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 35.29 mg of $C_{17}H_{20}N_2O_2S \cdot HCl$.

Category Antitussive.

Storage Preserve in tightly closed containers, protected from light.

Preparation Dioxopromethazine Hydrochloride Tablets

Dioxopromethazine Hydrochloride Tablets

Dioxopromethazine Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dioxopromethazine hydrochloride ($C_{17}H_{20}N_2O_2S \cdot HCl$).

Description Sugar-coated tablets with white core.

Identification (1) The light absorption of the solution obtained in Assay exhibits four maxima at 227 nm, 264 nm, 290.5 nm and 328 nm (Appendix IV A).

(2) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Content of uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with 40 ml of hydrochloric acid solution (0.1 mol/L) in portions and transfer to a 50 ml volumetric flask, shake for 15 minutes, add hydrochloric acid solution (0.1 mol/L) to volume, shake thoroughly and filter. Discard the initial filtrate, transfer accurately 5 ml of the successive filtrate to another 50 ml volumetric flask, dilute with hydrochloric acid solution (0.1 mol/L) to volume and mix well. Measure the absorbance of the resulting solution at 264 nm (Appendix IV A), calculate the content of $C_{17}H_{20}N_2O_2S \cdot HCl$, taking 362 as the value of A (1%, 1 cm).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay To 12 tablets in a 200 ml volumetric flask add 150 ml of hydrochloric acid solution (0.1 mol/L), shake to dissolve dioxopromethazine hydrochloride, dilute with hydrochloric acid solution (0.1 mol/L) to volume and mix well. Filter, discard the initial filtrate, transfer accurately 5 ml of the successive filtrate to a 100 ml of volumetric flask, dilute with hydrochloric acid solution (0.1 mol/L) to volume and mix well. Measure the absorbance of the resulting solution at 264 nm (Appendix IV A), calculate the content of $C_{17}H_{20}N_2O_2S \cdot HCl$, taking 362 as the value of A (1%, 1 cm).

Category As described under Dioxopromethazine Hydrochloride.

Strength 5 mg

Storage Preserve in tightly closed containers, protected from light.

Diphenhydramine Hydrochloride

$C_{17}H_{21}NO \cdot HCl$ 291.82

[147-24-0]

Diphenhydramine Hydrochloride is *N,N*-dimethyl-2-(diphenyl-methoxy)-ethanamine hydrochloride. It contains not less than 99.0% of $C_{17}H_{21}NO \cdot HCl$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, bitter and numbing.

Very soluble in water; freely soluble in ethanol or chloroform; sparingly soluble in acetone; very slightly soluble in ether or benzene.

Melting range 167-171°C (Appendix VI C).

Identification (1) To 5 mg add 1 drop of sulfuric acid; a yellow colour, then orange-red, is produced; forms white opalescence on adding water dropwise.

(2) Dissolve 30 mg in 1 ml of water, add 1 ml of hydrochloric acid; a white opalescence is produced, which turns to an oily liquid on boiling and forms a white waxy solid on cooling.

(3) The aqueous solution forms white curdy precipitate on adding silver nitrate TS dropwise.

(4) The light absorption of a 0.5 mg per ml solution in hydrochloric acid solution (0.01 mol/L) exhibits maxima at 253 nm and 258 nm (Appendix IV A).

(5) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diphenhydramine hydrochloride (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel H as the coating substance and a mixture of chloroform-methanol (8:2) as the mobile phase. Apply separately to the plate 5 μ l each of two solutions in methanol containing (1) 20 mg per ml, (2) 0.20 mg per ml of the substance being examined. After developing and removal of the plate, dry it in air and spray with dilute potassium iodobismuthate TS. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid and 4 ml of acetic anhydride, add 4 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 29.18 mg of $C_{17}H_{21}NO \cdot HCl$.

Category Antihistaminic.

Storage Preserve in tightly closed containers.

Preparation (1) Diphenhydramine Hydrochloride Injection

Diphenhydramine Hydrochloride Injection

Diphenhydramine Hydrochloride Injection is a sterile solution of Diphenhydramine Hydrochloride in Water. It contains not less than 95.0% and not more than 105.0% of the labelled amount of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$).

Description A clear, colourless liquid.

Identification The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

pH value 4.0-6.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with cyano bonded silica gel and a mixture of acetonitrile-water-triethylamine (50:50:0.5) (Adjust pH to 6.5 by glacial acetic acid) as the mobile phase. Detective Wavelength is 258 nm, and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of diphenhydramine hydrochloride. The resolution factor between the peaks of diphenhydramine hydrochloride and adjacent impurities should agree with the requirement.

Procedure Transfer a proper quantity equivalent to about 50 mg of diphenhydramine hydrochloride, accurately measured, to a 100 ml volumetric flask, dilute with water to the volume, mix well and filter, take the successive filtrate as the test solution. Inject 20 μ l into the column, record the chromatogram. Dissolve a quantity of diphenhydramine hydrochloride CRS, accurately weighed, in water to produce a solution of about 0.5 mg per ml, repeat the operations instead of the test solution, calculate the content of $C_{22}H_{28}FN_2O_8P$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Diphenhydramine Hydrochloride.

Strength 1 ml:20 mg

Storage Preserve in tightly closed containers, protected from light.

Diphenhydramine Hydrochloride Tablets

Diphenhydramine Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of diphenhydramine hydrochloride ($C_{17}H_{21}NO \cdot HCl$).

Description Sugar-coated or film-coated tablets with white core.

Identification (1) Extract a quantity of the coating removed and powdered tablets equivalent to about 0.1 g of diphenhydramine hydrochloride with 10 ml of chloroform. Filter and evaporate the filtrate to dryness on a water bath. The residue, dried at 80°C, complies with tests (1), (2) and (3) for Identification described under Diphenhydramine Hydrochloride.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in Assay.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw 5 ml of solution at exact 45 minutes and filter. Discard the initial filtrate, use the successive filtrate as the test preparation. Dissolve a quantity of diphenhydramine hydrochloride CRS in water to produce a solution of about 50 µg per ml as the reference solution, proceed as described under the Assay. Inject separately 50 µl each of the test and reference solution into the column and record the chromatogram. Calculate the dissolution of $C_{17}H_{21}NO \cdot HCl$ from each tablet, not less than 70% of the labelled amount is dissolved.

Related substances Extract a quantity of the powdered tablets equivalent to 50 mg of diphenhydramine hydrochloride with chloroform for 3 times, each of 10 ml. Combine the chloroform extracts, filter and evaporate the filtrate to dryness on a water bath. The residue complies with the test for Related substances described under Diphenhydramine Hydrochloride.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with cyano bonded silica gel and a mixture of acetonitrile-water-triethylamine (50:50:0.5) (Adjust pH to 6.5 by glacial acetic acid) as the mobile phase. Detective Wavelength is 258 nm, and the number of theoretical plates of the column is not less than 5000, calculated with reference to the peak of diphenhydramine hydrochloride. The resolution factor between the peaks of diphenhydramine hydrochloride and adjacent impurities should agree with the requirement.

Procedure Weigh accurately and powder 20 tablets removed the coat. To a quantity, weighed accurately, equivalent to about 50 mg of diphenhydramine hydrochloride, to a 100 ml volumetric flask, dissolve and dilute with water to the volume, mix well and filter, take the successive filtrate as the test solution. Inject 20 µl into the volumn, record the chromatogram. Dissolve a quantity of diphenhydramine hydrochloride CRS, accurately weighed, in water to produce a solution of about 0.5 mg per ml, repeat the operations instead of the test solution, calculate the content of $C_{22}H_{23}FN_2O_2 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Diphenhydramine Hydrochloride.

Strength 25 mg

Storage Preserve in tightly closed containers.

Diphenoxylate Hydrochloride

$C_{30}H_{32}N_2O_2 \cdot HCl$ 489.06

[3810-80-8]

Diphenoxylate Hydrochloride is 1-(3,3-diphenylpropyl-3-cyano)-4-phenyl-4-piperidine carboxylic acid ethyl ester hydrochloride. It contains not less than 98.0% of $C_{30}H_{32}N_2O_2 \cdot HCl$, calculated on the dried basis.

Description A white or almost white powder or crystalline powder; odourless.

Freely soluble in chloroform; soluble in methanol; sparingly soluble in ethanol or acetone; practically insoluble in water or ether.

Melting range 221-226°C (Appendix VI C).

Identification (1) The light absorption of a 0.5 mg per ml solution in a mixture of 1 mol/L hydrochloric acid solution methanol (1:99) exhibits maxima at 252 nm, 258 nm and 264 nm. The ratio of absorbance at 258 nm to that at 252 nm is 1.1-1.3 (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diphenoxylate hydrochloride (Appendix VI).

(3) The saturated aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.4 g, accurately weighed, in 20 ml of glacial acetic acid and 5 ml of mercuric acetate TS, shake thoroughly, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes blue. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 48.91 mg of $C_{30}H_{32}N_2O_2 \cdot HCl$.

Category Antidiarrhoeal agent.

Storage Preserve in tightly closed containers.

Preparation Compound Diphenoxylate Tablets

Compound Diphenoxylate Tablets

Compound Diphenoxylate Tablets contain 2.25-2.75 mg of diphenoxylate hydrochloride ($C_{30}H_{32}N_2O_2 \cdot HCl$) and 20.0-30.0 µg of atropine sulfate ($C_{17}H_{23}NO_3)_2 \cdot H_2SO_4 \cdot H_2O$ in each tablet.

Formula	Diphenoxylate hydrochloride	2.5 g
	Atropine sulfate	0.025 g

To make	1000 tablets
---------	--------------

Description White tablets.

Identification The retention time of principal peaks of the diphenoxylate hydrochloride and atropine sulfate being examined in the chromatogram obtained in the Assay are identical with that of the diphenoxylate hydrochloride CRS and atropine sulfate CRS.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Triturate 1 tablet with the mobile phase in the Assay described under Diphenoxylate Hydrochloride in a mortar and transfer with the said mobile phase in portions to a 50 ml volumetric flask, shake thoroughly, dilute to volume with the said mobile phase, mix well and filter. Carry out the Assay described under Diphenoxylate Hydrochloride, using the successive filtrate.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay *Diphenoxylate hydrochloride* Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of triethylamine phosphoric acid solution (to 4 ml of triethylamine add 500 ml of water and 2 ml of phosphoric acid,

dilute to 1000 ml with water, mix well)-acetonitrile(45:55), adjust the pH value to 3.1 ± 0.2 , as the mobile phase. Detection wavelength is 230 nm and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of diphenoxylate hydrochloride.

Procedure Weigh accurately and powder 50 tablets. Dissolve an accurately weighed quantity of the powdered tablets equivalent to about 2.5 mg of Diphenoxylate hydrochloride in 50 ml volumetric flask with a quantity of the mobile phase, shake thoroughly. Dilute with the mobile phase to volume, mix well and filter. Inject accurately 20 μ l of the successive filtrate into the column. Dilute an accurately weighed quantity of diphenoxylate hydrochloride CRS with mobile phase to produce a solution of 50 μ g per ml. Repeat the operation, calculate the content of $C_{30}H_{32}N_2O_2 \cdot HCl$ with respect to the peak area obtained in the chromatogram by the external standard method.

Atropine sulfate Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of triethylamine phosphoric acid solution (to 4 ml of triethylamine add 500 ml of water and 1.8 ml of phosphoric acid, dilute to 1000 ml with water, mix well)-acetonitrile(85:15), adjust the pH value to 5.8 ± 0.2 , as the mobile phase. Detection wavelength is 206 nm and the number of theoretical plates of the column is not less than 3000, calculated with reference to the peak of Atropine sulfate.

Procedure Dissolve an accurately weighed quantity of the powdered tablets equivalent to about 0.5 mg of Atropine sulfate in 50 ml volumetric flask with a quantity of the mobile phase, shake thoroughly. Dilute with the mobile phase to volume, mix well and filter. Inject accurately measured 20 μ l of the successive filtrate into the column. Dilute an accurately weighed quantity of Atropine sulfate CRS with mobile phase to produce a solution of 10 μ g per ml. Repeat the operation, calculate the content of $C_{17}H_{23}NO_3 \cdot H_2SO_4$ with respect to the peak area obtained in the chromatogram by the external standard method and multiply by 1.027.

Category Antidiarrhoeal.

Storage Preserve in tightly closed containers.

Dipivefrin Hydrochloride

$C_{19}H_{29}NO_5 \cdot HCl$ 387.90

[64019-93-8]

Dipivefrin Hydrochloride is (\pm)-3,4-dihydroxy- α [(methylamino) methyl] benzyl alcohol 3,4-dipivalate hydrochloride. It contains not less than 98.5% and not more than 101.5% of $C_{19}H_{29}NO_5 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter; hygroscopic; deteriorated on exposure to light or air.

Very soluble in water; freely soluble in ethanol; very slightly soluble in ethyl acetate; practically insoluble in petroleum ether.

Melting range 161-166°C (Appendix VI C), melts within a range of 2°C.

Identification (1) Dissolve about 10 mg in 10 ml of sodium hydroxide TS, a pale yellow colour is produced gradually. When examined under ultraviolet light (365 nm), a yellow fluorescence is produced.

(2) The retention time of principal peak of dipivefrin hydrochloride in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of dipivefrin hydrochloride CRS in the chromatogram of the reference solution.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dipivefrin hydrochloride (No. 335 in Spectra Atlas).

(4) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH5.0-6.5 (Appendix VI H).

Clarity and colour of solution A solution of 100 mg per ml in water is clear and colourless.

Related substances Dissolve a quantity of the substance being examined in the mobile phase to produce a solution of 1 mg per ml as the test solution. Dilute an accurately measured quantity of the test solution with the mobile phase to produce a solution of 10 μ g per ml as the reference solution (1). Dissolve a quantity of (\pm) 3,4-dihydroxy-2'-methylaminoacetophenone-3,4-dipivalate perchlorate in the mobile phase to produce a solution of 5 μ g per ml as the reference solution (2). Carry out the procedure as described under Assay, inject 20 μ l of the reference solution (1) into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 20% of the full scale of the chart. And then inject separately 20 μ l each of the test solution and the two reference solutions into the column, record the chromatogram for twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the peak area of the impurity which has the same retention time as that in the chromatogram obtained with the reference solution (2) is not greater than the peak area in the reference solution (2) (0.5%), the sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (1).

Loss on drying When dried in vacuum to constant weight at 60°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.0015%.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of phosphoric acid (dissolve 13.6 g of potassium dihydrogen phosphate in water and dilute with water to 1000 ml, adjust to pH 3.5 with 10% phosphoric acid)-acetonitrile (60:40) as the mobile phase. Detection wavelength is 254 nm and the number of the theoretical plates of the column is not less than 1500, calculated with reference to the peak of dipivefrin. The resolution factor between the peak of dipivefrin and the adjacent impurity peaks complies with the related requirements.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce a solution of 1 mg per ml as the test solution. Inject 20 μ l of the test solution into the column. Repeat the operation, using dipivefrin hydrochloride CRS instead of the substance being examined. Calculate the content of $C_{19}H_{29}NO_5 \cdot HCl$ with respect to the

peak area obtained in the chromatogram by the external standard method.

Category Ophthalmics.

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Preparation Dipivefrin Hydrochloride Eye Drops

Dipivefrin Hydrochloride Eye Drops

Dipivefrin Hydrochloride Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of dipivefrin hydrochloride ($C_{19}H_{29}NO_5 \cdot HCl$).

Description A clear, colourless liquid.

Identification (1) To about 5 ml add 2 ml of sodium hydroxide TS, allow to stand for a few minutes, a pale yellow colour is produced. When examined under ultraviolet light (365 nm), a yellow fluorescence is produced.

(2) The retention time of principal peak of the dipivefrin hydrochloride in the substance being examined in the chromatogram obtained in the Assay is identical with that of the principal peak of dipivefrin hydrochloride CRS in the chromatogram of the reference solution.

pH value 3.5-5.0 (Appendix VI H).

Related substances Carry out the method described under Related substances in Dipivefrin Hydrochloride using the substance being examined as the test solution. In the chromatogram obtained with the test solution, the peak area of the impurity which has the same retention time as that in the chromatogram obtained with the reference solution (2) is not greater than the peak area in the reference solution (2) (0.5%), the sum of the areas of all peaks other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (1).

Other requirements Comply with the general requirements for ophthalmic preparations (Appendix I G).

Assay Carry out the method described under Assay in Dipivefrin Hydrochloride, using the substance being examined as the test solution.

Category As described under Dipivefrin Hydrochloride.

Strength (1) 5 ml : 5 mg (2) 8 ml : 8 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Diprophylline

$C_{10}H_{14}N_4O_4$ 254.25

[479-18-5]

Diprophylline is 1,3-dimethyl 7-(2,3-dihydroxypropyl)-3,7-dihydro-1H-purine-2,6-dione. It contains not less than 98.0% of $C_{10}H_{14}N_4O_4$, calculated on the

dried basis.

Description A white powder or granules; odourless; taste, bitter.

Freely soluble in water; slightly soluble in ethanol; very slightly soluble in chloroform or ether.

Melting range 160-164°C (Appendix VI C).

Specific absorbance Measure the absorbance of a solution of 10 µg per ml in water at 273 nm (Appendix IV A), the value of A (1%, 1 cm) is 354-376.

Identification (1) Heat under reflux about 1 g in a conical flask with 5 ml of acetic anhydride for 30 minutes and cool. Add 50 ml of water, mix well and rub the flask wall with a glass rod; a white crystalline precipitate is produced gradually. Filter, wash the precipitate with a quantity of water and dry at 105°C for 1 hour. The melting range of the precipitate is 141-147°C (Appendix VI C).

(2) To about 0.1 g add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, evaporate to dryness on a water bath; a violet colour is produced on exposure to ammonia vapour and the colour disappears by adding a few drops of sodium hydroxide TS.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of diprophylline (Appendix XVI).

Acidity or alkalinity Dissolve 0.50 g in 10 ml of water, add 5 drops of bromothymol blue IS; a yellow or green colour is produced. Add 0.20 ml of sodium hydroxide (0.02 mol/L) VS; a blue colour is produced.

Clarity and colour of solution Dissolve 1.0 g in 10 ml of water, shake thoroughly the solution is clear and colourless, any colour produced is not more intense than that of reference solution Y₁ or YG₁ (Appendix IX A, method 1).

Chloride Boil 0.25 g with 5 ml of water and 1.0 ml of sodium hydroxide TS for 30 seconds and cool. Carry out the limit test for chlorides (Appendix VIII A), any opalescence produced is not more pronounced than that of a reference using 7.0 ml of sodium chloride standard solution (0.028%).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel GF₂₅₄ as the coating substance and a mixture of chloroform-dehydrated ethanol-concentrated ammonia solution (90:10:1.5) as the mobile phase. Apply separately to the plate 10 µl each of three solutions in methanol-water (30:20) containing (1) 30 mg, (2) 0.45 mg, (3) 0.30 mg of the substance being examined per ml. After developing and removal of the plate, dry in air and examine under ultraviolet light at 254 nm. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (3), and not more than one of such spot is intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.15% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 2 ml of acetic acid (pH 3.5) and a quantity of water to produce 25 ml, carry out the limit tests for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 2 ml of anhydrous formic acid, add slowly 50 ml of acetic anhydride and shake for 3 minutes. Add 4-5 drops of sudan IV IS, titrate with perchloric acid (0.1 mol/L) VS until a violet

colour is obtained. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 25.42 mg of $C_{10}H_{14}N_4O_4$.

Category Smooth muscle relaxant.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Diprophylline Injection
(2) Diprophylline Tablets

Diprophylline Injection

Diprophylline Injection is a sterile solution of diprophylline in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of diprophylline ($C_{10}H_{14}N_4O_4$).

Description A clear colourless liquid.

Identification (1) To 1 ml add 2 ml of water, mix well, add a few drops of tannic acid TS, a white precipitate is produced.

(2) Evaporate 1 ml to dryness on a water bath, add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, evaporate to dryness on a water bath, a purple colour is produced on exposure to ammonia vapour and the purple colour disappears on the addition of a few drops of sodium hydroxide TS.

pH value 4.0-7.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer accurately a quantity equivalent to about 0.25 g of diprophylline into a 250 ml volumetric flask, dilute with water to volume and mix well. Transfer accurately 5 ml of the solution into a 200 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance at 273 nm (Appendix IV A), calculate the content of $C_{10}H_{14}N_4O_4$, taking 365 as the value of A (1%, 1 cm).

Category As described under Diprophylline.

Strength 2 ml : 0.25 g

Storage Preserve in tightly closed containers, protected from light.

Diprophylline Tablets

Diprophylline Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of diprophylline ($C_{10}H_{14}N_4O_4$).

Description White tablets.

Identification (1) To a quantity of the powdered tablets equivalent to about 0.5 g of diprophylline add 5 ml of water, shake to dissolve diprophylline. Filter and evaporate 1 ml of the filtrate to dryness on a water bath. The residue complies with test (2) for Identification described under Diprophylline.

(2) The light absorption of the solution obtained in the Assay exhibits a maximum at 273 nm and a minimum at 246 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100

rpm. withdraw the solution at exact 30 minutes and filter. Dilute 3 ml of the successive filtrate, accurately measured, with water to volume in a 25 ml volumetric flask (0.1 g for strength) or a 50 ml volumetric flask (0.2 g for strength) and mix well. Measure the absorbance of the resulting solution at 273 nm (Appendix IV A). Calculate the dissolution of $C_{10}H_{14}N_4O_4$ from each tablet, taking 365 as the value of A (1%, 1 cm). Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Transfer a quantity, accurately weighed, equivalent to about 0.15 g of diprophylline to a 500 ml volumetric flask, add a quantity of water, shake thoroughly and add water to volume. Transfer accurately 10 ml of the successive filtrate to a 200 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance at 273 nm (Appendix IV A) and calculate the content of $C_{10}H_{14}N_4O_4$, taking 365 as the value of A (1%, 1 cm).

Category As described under Diprophylline.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, stored in a dry place.

Dipyridamole

$C_{24}H_{40}N_8O_4$ 504.63

[58-32-2]

Dipyridamole is 2, 2', 2'', 2'''-(4,8-dipiperidino-pyrimido [5,4-d] pyrimidin-2,6-diyl) dinitrilo]-tetrakis-ethanol. It contains not less than 98.0% and not more than 102.0% of $C_{24}H_{40}N_8O_4$, calculated on the dried basis.

Description A yellow crystalline powder; odourless; taste, slightly bitter.

Freely soluble in chloroform; soluble in ethanol; slightly soluble in acetone; practically insoluble in water; freely soluble in dilute acid.

Melting range 162-168°C (Appendix VI C).

Identification (1) Dissolve 10 mg in ethanol, a green fluorescence is produced; add a few drops of acid, the fluorescence is disappeared.

(2) Dissolve about 10 mg in 20 ml of dilute hydrochloric acid, add dropwise a 1% solution of potassium chromate, a purple colour is produced, which disappears on shaking; add excess of 1% solution of potassium chromate, no purple colour is produced.

(3) The light absorption of a solution of 10 µg per ml in hydrochloric acid solution (0.01 mol/L) exhibits maxima at 234 nm, 284 nm and 405 nm, the absorbance at 284 nm is about 0.62 (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Dipyridamole (Appendix XVI).

Chlorinate compound Carry out the method for oxygen flask combustion (Appendix VII C), using about 20 mg and using 20 ml of a 0.4% solution of sodium hydroxide as the absorbing liquid. When the combustion is complete, shake vigorously the liquid for 15 minutes, add 10 ml of dilute nitric acid and transfer the liquid to a 50 ml Nessler cylinder. Carry out the limit test for chlorides (Appendix VIII A), using the resulting solution. Any opalescence produced is not more pronounced than that of a reference prepared in the same manner using 4.0 ml of sodium chloride standard solution (0.20%).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of dibasic sodium hydrogen phosphate in methanol [Dissolve 250 mg of dibasic sodium phosphate in 250 ml of water, adjust with phosphoric acid (1→3) solution to pH of 4.6 and dilute with methanol to 1000 ml, mix well] as the mobile phase. Detection wavelength is at 288 nm, and the number of theoretical plates of the column is not less than 600, calculated with reference to the peak of dipyridamole. Prepare a solution of 1.0 mg per ml of substance being examined in methanol as the test solution; and dilute the test solution with methanol to produce a solution of 1 µg per ml as the reference solution. Inject 10 µl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is about 10% of full scale of the chart. Inject separately 10 µl each of the test solution and the reference solution and record the chromatograph for twice the retention time of principal peak, the sum of the area of all peaks other than the principal peak obtained from the test solution is not greater than the principal peak obtained from the reference solution.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in Residue on ignition; not more than 0.001%.

Assay Dissolve about 0.3 g, accurately weighed, in 50 ml of dilute hydrochloric acid. Titrate slowly with potassium bromate (0.01667 mol/L) VS, towards the end of titration, shake frequently and titrate in dropwise until no red-violet colour is produced. Each ml of potassium bromate (0.01667 mol/L) VS is equivalent to 25.23 mg of $C_{24}H_{40}N_8O_4$.

Category Anticoagulant; coronary artery dilator.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Dipyridamole Injection
(2) Dipyridamole Tablets

Dipyridamole Injection

Dipyridamole Injection is a sterile solution of dipyridamole in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of dipyridamole ($C_{24}H_{40}N_8O_4$).

Description A clear, yellow liquid with fluorescence.

Identification (1) To 2 ml add 2 ml of dilute hydrochloric acid and 1% potassium chromate solution dropwise, a purple colour is produced and disappears on shaking. Add excess 1% potassium chromate solution, the colour is not reproduced.

(2) Dilute 1 ml with 20 ml of water, a greenish fluorescence is produced, which disappears after adding acid.

(3) The light absorption of the solution obtained in the Assay exhibits a maximum at 283 nm (Appendix IV A).

pH value 2.5-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer accurately 5 ml to a 50 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume and mix well. Transfer accurately 2 ml to a 100 ml volumetric flask, dilute to volume and mix well. Measure the absorbance at 283 nm (Appendix IV A), calculate the content of $C_{24}H_{40}N_8O_4$ taking 625 as the value of A (1%, 1 cm).

Category As described under Dipyridamole.

Strength 2 ml : 10 mg

Storage Preserve in tightly closed containers, protected from light.

Dipyridamole Tablets

Dipyridamole Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of dipyridamole ($C_{24}H_{40}N_8O_4$).

Description Sugar-coated tablets with yellow core.

Identification To a quantity of powdered tablets with coating removed, equivalent to about 0.2 g of dipyridamole, add 20 ml of chloroform and stir to dissolve dipyridamole and filter. Evaporate the filtrate to dryness on a water bath, the residue complies with tests (1), (2) and (3) for Identification described under Dipyridamole.

Content uniformity Comply with the requirements (Appendix X E). Triturate 1 tablet with coating removed. Carry out the determination of content described under Assay, beginning at the words "to a 100 ml volumetric flask...".

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm, withdraw 10 ml of the solution at exact 30 minutes and filter, discard the initial filtrate. Measure accurately a quantity of the successive filtrate and dilute with the dissolution medium to produce a solution of 10 µg per ml. Dissolve and dilute an accurately weighed quantity of dipyridamole CRS in the dissolution medium to produce a solution of similar concentration. Measure the absorbance of the resulting solutions at 283 nm (Appendix IV A), and calculate the dissolution of $C_{24}H_{40}N_8O_4$ from each tablet, not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. Transfer accurately a quantity of the powder equivalent to about 50 mg of dipyridamole to a 100 ml volumetric flask, add a quantity of hydrochloric acid (0.01

mol/L) VS, shake to dissolve dipyridamole, dilute with hydrochloric acid (0.01 mol/L) VS to volume and mix well. Filter and discard the initial filtrate. Measure accurately a quantity of the successive filtrate, dilute with hydrochloric acid (0.01 mol/L) VS to produce a solution of 10 µg per ml. Measure the absorbance of the solution at 283 nm (Appendix IV A), calculate the content of $C_{21}H_{29}N_3O_4$, taking 625 as the value of A (1%, 1 cm).

Category As described under Dipyridamole.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Disopyramide Phosphate

$C_{21}H_{29}N_3O \cdot H_3PO_4$ 437.47

[22059-60-5]

Disopyramide Phosphate is α -[2-(Disopropylamino)ethyl]- α -phenyl-2-pyridineacetamide phosphate. It contains not less than 98.5% (for injection) or 98.0% (for oral administration) of $C_{21}H_{29}N_3O \cdot H_3PO_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, bitter. Freely soluble in water; slightly soluble in ethanol; soluble in glacial acetic acid.

Melting range 206-209°C (for injection) or 205-209°C (for oral administration), with decomposition (Appendix VI C).

Identification (1) The light absorption of a solution of 50 µg per ml in water exhibits a maximum at 261 nm, the absorbance is about 0.47 (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of disopyramide phosphate (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of phosphates (Appendix III).

Acidity A solution of 0.10 g in 10 ml of water, pH 4.0-5.0 (Appendix VI H).

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica HF₂₅₄ with the adhesive of sodium carboxymethylcellulose as the coating substance and a mixture of ethyl acetate-methanol-concentrated ammonia TS (78:20:2) as the mobile phase. Apply to the plate 2 µl of the solution of 0.1 g per ml the substance being examined in 75% ethanol. After developing and removal of the plate, examine under ultraviolet light. No spot other than the principal spot in the chromatogram is obtained.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Heavy metals Dissolve 1.0 g in 20 ml of water and 4 ml of dilute hydrochloric acid, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.1 g, accurately weighed, in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.87 mg of $C_{21}H_{29}N_3O \cdot H_3PO_4$.

Category Anti-arrhythmic.

Storage Preserve in tightly closed containers.

Preparation (1) Disopyramide Phosphate Injection
(2) Disopyramide Phosphate Tablets

Disopyramide Phosphate Injection

Disopyramide Phosphate Injection is a sterile solution of disopyramide phosphate in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of disopyramide phosphate ($C_{21}H_{29}N_3O \cdot H_3PO_4$).

Description A clear, colourless liquid.

Identification Complies with the tests (1) and (3) for Identification described under Disopyramide Phosphate.

pH value 4.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Evaporate 5 ml (for strength 2 ml:50 mg) or 2 ml (for strength 2 ml:100 mg), accurately measured, on a water bath to dryness, dry at 105°C for 1 hour and cool. Dissolve the residue in 10 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.87 mg of $C_{21}H_{29}N_3O \cdot H_3PO_4$.

Category As described under Disopyramide Phosphate.

Strength (1) 2 ml:50 mg (2) 2 ml:100 mg

Storage Preserve in tightly closed containers.

Disopyramide Phosphate Tablets

Disopyramide Phosphate Tablets contain not less than 95.0% and not more than 105.0% of the labelled amount disopyramide phosphate ($C_{21}H_{29}N_3O \cdot H_3PO_4$).

Description White tablets.

Identification (1) Transfer a quantity of powdered tablets, equivalent to about 5 mg of disopyramide phosphate, to a 100 ml volumetric flask, add a quantity of water and shake to dissolve disopyramide phosphate, dilute with water to volume and filter. The filtrate complies with the test (1) for Identification described under Disopyramide Phosphate.

(2) Shake a quantity of powdered tablets with water, filter, the filtrate yields the reactions characteristic of phosphates (Appendix III).

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Weigh accurately a quantity of the powder, equivalent to about 0.25

g of disopyramide phosphate, to a 25 ml volumetric flask, add a quantity of glacial acetic acid, shake to dissolve disopyramide phosphate, dilute with glacial acetic acid to volume, mix well and filter. Measure accurately 10 ml of the successive filtrate, carry out the Assay as described under Disopyramide Phosphate. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 21.87 mg of $C_{21}H_{29}N_3O \cdot H_3PO_4$.

Category As described under Disopyramide Phosphate.

Strength 0.1 g

Storage Preserve in tightly closed containers.

Dithranol

$C_{14}H_{10}O_3$ 226.23

[1143-38-0]

Dithranol is 1,8-dihydroxy-9-anthrone. It contains not less than 95.0% of $C_{14}H_{10}O_3$, calculated on the dried basis.

Description Yellow to slightly yellowish-brown crystals or a powder; odourless.

Soluble in chloroform; very slightly soluble in ethanol; practically insoluble in water; slightly soluble in glacial acetic acid.

Melting range 176-181°C (Appendix VI C).

Identification (1) The light absorption in the range of 240 nm to 400 nm (Appendix IV A) of the solution obtained in the Assay exhibits maxima at 257 nm, 289 nm and 356 nm. The ratio of the absorbance at 257 nm and 289 nm is 1.06-1.10. The ratio of the absorbance at 356 nm and 289 nm is 0.90-0.94.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of dithranol (Appendix XVI).

Acidity Shake 1.0 g with 25 ml of water, filter. To 10 ml of the filtrate, add 2 drops of methyl red IS, the solution shows no red colouration.

Dihydroxyanthraquinone The light absorption at 432 nm (Appendix IV A) of a solution of 0.10 mg per ml in chloroform is not greater than 0.12.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the Residue on ignition; not more than 0.002%.

Assay Dissolve an accurately weighed quantity in chloroform to produce a solution of about 10 µg per ml and measure the absorbance at 356 nm (Appendix IV A), and calculate the content of $C_{14}H_{10}O_3$, taking 463 as the value of A (1%, 1 cm).

Category Antipsoriatic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation Dithranol Ointment

Dithranol Ointment

Dithranol Ointment contains not less than 85.0% and not more than 110.0% of the labelled amount of dithranol ($C_{14}H_{10}O_3$).

Description A yellow ointment.

Identification (1) Heat a quantity equivalent to about 0.5 mg of dithranol, with 5 ml of sodium hydroxide TS on a water bath, a red colour is produced.

(2) The light absorption spectrum of the test preparation obtained in the Assay is concordant with that of the reference preparation in the range of 440-470 nm (Appendix IV A).

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay Weigh accurately a quantity of the ointment equivalent to 2 mg of dithranol in a 50 ml beaker. Add 10 ml of glacial acetic acid and heat on a water bath for 3 minutes with constant stirring. Cool in a cold water bath and allow the ointment base to congeal. Filter the extract into a 50 ml volumetric flask. Repeat the extraction with three 10 ml portions of glacial acetic acid in a similar manner, collecting the filtrates in the same volumetric flask, dilute with glacial acetic acid to volume and mix well. Dissolve an accurately weighed quantity of dithranol CRS and dilute to produce a solution of 40 µg per ml with glacial acetic acid, as the reference solution.

Transfer separately 5 ml each of the test solution and the reference solution, accurately measured, to two 25 ml volumetric flasks. Add to each flask 1 ml of freshly prepared 5% sodium nitrite solution, accurately measured, and mix well. Heat in a boiling water bath for 3 minutes and cool to room temperature immediately. Dilute with glacial acetic acid to volume, mix well and filter if necessary. Measure the absorbance of the two solutions at 450 nm (Appendix IV A) and calculate the content of $C_{14}H_{10}O_3$ in the ointment.

Category As described under Dithranol.

Strength (1) 0.1% (2) 0.5% (3) 1%

Storage Preserve in tightly closed containers, protected from light.

Dobutamine Hydrochloride

$C_{18}H_{23}NO_3 \cdot HCl$ 337.85

[49745-95-1]

Dobutamine hydrochloride is 4-[2-[1-methyl-3-(4-hydroxyphenyl)-propyl]amino]ethyl]-1,2-benzenediol hydrochloride. It contains not less than 98.5% of $C_{18}H_{23}NO_3 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder; almost odourless; taste, slightly bitter. The colour deepens on exposure to air or light.

Sparingly soluble in water or dehydrated ethanol; practically insoluble in chloroform.

Melting range 188-193°C (Appendix VI C).

Identification (1) Dissolve 10 mg in 2 ml of water, add 1 drop of ferric chloride TS, the solution becomes green; then add 1 drop of ammonia TS, the colour changes to bluish-violet immediately, then to violet and finally becomes purple.

(2) The light absorption of a 40 µg per ml solution in hydrochloric acid solution (9→1000) exhibits maxima at 220 nm and 278 nm (Appendix IV A).

(3) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of dobutamine hydrochloride (Appendix XVI).

(4) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Clarity of solution A solution of 0.10 g in 10 ml of freshly boiled and cooled water is clear.

Acidity pH of the solution obtained in the test for Clarity of solution is 4.5-6.0 (Appendix VI H).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid by warming, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 33.78 mg of $C_{18}H_{23}NO_3 \cdot HCl$.

Category β-adreno receptor activator.

Storage Preserve in tightly closed containers, protected from light.

Preparation Dobutamine Hydrochloride Injection

Dobutamine Hydrochloride Injection

Dobutamine Hydrochloride Injection is a sterile solution of dobutamine hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of dobutamine ($C_{18}H_{23}NO_3$).

Description A clear, colourless liquid.

Identification Complies with tests (1), (2) and (4) for Identification described under Dobutamine Hydrochloride.

pH value 2.5-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity with hydrochloric acid solution (9→1000) to produce a solution of 40 µg dobutamine per ml. Measure the absorbance at 278 nm (Appendix IV A) and calculate the content of $C_{18}H_{23}NO_3$, taking 137 as the value of A (1%, 1 cm).

Category As described under Dobutamine Hydrochloride.

Strength 2 ml : 20 mg (calculated as dobutamine)

Storage Preserve in tightly closed containers, protected

from light.

Domiphen Bromide

$C_{22}H_{40}BrNO \cdot H_2O$ 432.49

[538-71-6]

Domiphen Bromide is *N,N*-dimethyl-*N*-(2-phenoxyethyl)-1-dodecanaminium bromide monohydrate. It contains not less than 98.0% of $C_{22}H_{40}BrNO$, calculated on the dried basis.

Description White to pale yellow crystalline flakes; odourless or with a light characteristic odour; taste, bitter; the aqueous solution foams on shaking.

Very soluble in ethanol or chloroform; freely soluble in water; sparingly soluble in acetone; practically insoluble in ether.

Identification (1) Dissolve 50 mg in 10 ml of water, add a few drops of potassium ferricyanide TS, a yellow precipitate is produced.

(2) Dissolve 10 mg in 10 ml of water, add 0.5 ml of eosin solution IS and 100 ml of water, an intense pink colour is produced.

(3) The light absorption of a solution of 0.1 mg per ml in water exhibits maxima at 268 nm and 275 nm (Appendix IV A).

(4) Mix 0.1 g with 0.5 g of sodium carbonate, ignite until it is thoroughly charred, cool. Heat with 5 ml of water to dissolve the residue. Allow to cool, filter, acidify the filtrate with nitric acid, the solution yields the reactions characteristic of bromides (Appendix III).

Acidity Dissolve 0.20 g in 20 ml of water, pH 5.0-7.0 (Appendix VI H).

Clarity and colour of solution A solution of 1.0 g in 10 ml of water is clear and colourless. Any opalescence produced is not more pronounced than that of reference suspension II (Appendix IX B); and any colour produced is not more intense than reference solution Y₁ (Appendix IX A, method 1).

Loss on drying When dried to constant weight at 80°C, loses not more than 5.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.2 g, accurately weighed, with 75 ml of water in a 250 ml stoppered conical flask, add 2 ml of 1% sodium bicarbonate solution, mix well. Add 10 ml of chloroform and 8 drops of bromophenol blue IS, titrate with sodium tetraphenylborate (0.02 mol/L) VS shaking vigorously towards the end of titration until the blue colour of the chloroform layer disappears. Each ml of sodium tetraphenylborate (0.02 mol/L) VS is equivalent to 8.289 mg of $C_{22}H_{40}BrNO$.

Category Antiseptic, Disinfectant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Domiphen Bromide Pills

Domiphen Bromide Pills

Domiphen Bromide Pills contain not less than 85.0% and not more than 115.0% of the labelled amount of domiphen bromide ($C_{22}H_{40}BrNO \cdot H_2O$).

Description White to pale yellow pills.

Identification Comply with tests (1), (2) and (4) for Identification described under Domiphen Bromide.

Other requirements Comply with the general requirements for pills (Appendix I H).

Assay Dissolve 20 pills with a quantity of water in a 50 ml volumetric flask, dilute to volume and mix well. Transfer accurately 20 ml to a 250 ml stoppered conical flask, add 50 ml of water, carry out the method for Assay described under Domiphen Bromide beginning at the words "add 2 ml of 1% sodium bicarbonate solution...". Each ml of sodium tetraphenylborate (0.02 mol/L) VS is equivalent to 8.650 mg of $C_{22}H_{40}BrNO \cdot H_2O$.

Category As described under Domiphen Bromide.

Strength 20 mg

Storage Preserve in tightly closed containers, protected from light.

Dopamine Hydrochloride

$C_8H_{11}NO_2 \cdot HCl$ 189.64

[62-31-7]

Dopamine Hydrochloride is 4-(2-aminoethyl)-1,2-benzenediol hydrochloride. It contains not less than 98.0% of $C_8H_{11}NO_2 \cdot HCl$, calculated on the dried basis.

Description White or almost white lustrous crystals; odourless; taste, slightly bitter; darkens gradually on exposure to light and air.

Freely soluble in water; slightly soluble in dehydrated ethanol; very slightly soluble in chloroform or ether.

Melting range 243-249°C (Appendix VI C).

Identification (1) Dissolve 0.1 g in 5 ml of water, add 20 ml of trinitrophenol TS, mix, a crystalline precipitate is produced on standing. Dry at 105°C after washing with water and small amount of ethanol, it melts at about 200°C with decomposition (Appendix VI C).

(2) Dissolve 10 mg in 1 ml of water, add 1 drop of ferric chloride TS; a deep green colour is produced, which changes to purple on addition of 1% ammonia solution dropwise.

(3) The light absorption of a solution of about 30 µg per ml in 0.5% sulfuric acid solution exhibits maximum at 280 nm (Appendix IV A).

(4) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of the dopamine hydrochloride (Appendix XVI).

(5) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity The solution obtained in Clarity of solution has a pH value of 3.5-5.5 (Appendix VI H).

Clarity and colour of solution A solution of 0.10 g in 10 ml of freshly boiled and cooled water is clear and colourless. Any colour produced is not more intense than reference solution Y₁ (Appendix IX A, method 1).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve 0.15 g, accurately weighed, in 25 ml of glacial acetic acid by boiling, cool to about 40°C, add 5 ml of mercuric acetate TS, cool, add 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 18.96 mg of $C_8H_{11}NO_2 \cdot HCl$.

Category Dopamine receptor stimulating agent.

Storage Preserve in tightly closed containers in presence of nitrogen, protected from light.

Preparation Dopamine Hydrochloride Injection

Dopamine Hydrochloride Injection

Dopamine Hydrochloride Injection is a sterile solution of dopamine hydrochloride in Water for Injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of dopamine hydrochloride ($C_8H_{11}NO_2 \cdot HCl$).

Description A clear, colourless liquid.

Identification Complies with the tests (1), (2), (3) and (5) for Identification described under Dopamine Hydrochloride.

pH value 3.0-4.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay *Reference preparation* Transfer accurately a quantity equivalent to 0.1 g of dopamine hydrochloride CRS to a 100 ml volumetric flask, add sulfuric acid solution (1→350) to volume and shake well.

Test preparation Measure accurately 10 ml to a 100 ml volumetric flask, dilute with sulfuric acid solution (1→350) to volume and mix well.

Procedure To 5 ml each of the two solution, accurately measured, in two 100 ml volumetric flasks add 5 ml of freshly prepared ferrous sulfate-tartrate solution (dissolve 1 g of ferrous sulfate, 2 g of sodium potassium tartrate and 0.1 g of sodium bisulfite in water and dilute to 1000 ml), dilute with buffer solution (dissolve 50 g of ammonium acetate in 1000 ml of 20% ethanol and adjust to pH 8.5 with ammonia TS) to volume and mix well. Measure the absorbance at 520 nm (Appendix IV B) and calculate the content of $C_8H_{11}NO_2 \cdot HCl$.

Category As described under Dopamine Hydrochloride.

Strength 2 ml:20 mg

Storage Preserve in well closed containers, protected from light.

Doxapram Hydrochloride

$C_{24}H_{30}N_2O_2 \cdot HCl \cdot H_2O$ 432.99 [7081-53-0]

Doxapram Hydrochloride is 1-ethyl-3,3-diphenyl-4-(2-morpholinoethyl)-2-pyrrolidinone monohydrochloride monohydrate. It contains not less than 98.0% and not more than 100.5% of $C_{24}H_{30}N_2O_2 \cdot HCl$, calculated on the dried basis.

Description A white or almost white crystalline powder, odourless. Sparingly soluble in water, chloroform or ethanol; insoluble in ether.

Melting range 217-221°C (Appendix VI C)

Identification (1) The light absorption of a solution of 400 µg per ml in water exhibits maxima at 252 nm, 258 nm and 264 nm, and minima at 244 nm, 254 nm and 262 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference of doxapram hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.50 g in 50 ml of water, pH 3.5-5.0 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of isopropanol-ammonia (1 mol/L) (15:1) as the mobile phase. Apply separately to the plate 10 µl each of two solutions in methanol containing (1) 60 mg per ml, (2) 0.12 mg per ml of the substance being examined. After developing and removal of the plate, dry in air and spray with diluted potassium iodobismuthate TS. Any spot other than the principal spot, obtained with solution (1) is no more in evidence than the principal spot obtained with solution (2).

Loss on drying When dried at 105°C for 2 hours, loses 3.0%-4.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.3% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Arsenic Dissolve 1.0 g in 5 ml of hydrochloric acid and 23 ml of water. Carry out the limit test for arsenic (Appendix VIII J, method 1); not more than 0.0002%.

Assay Dissolve about 0.4 g previously dried at 105°C for 2 hours, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 41.50 mg

of $C_{24}H_{30}N_2O_2 \cdot HCl$.

Category Central stimulant.

Storage Preserve in tightly closed containers, protected from light.

Preparation Doxapram Hydrochloride Injection

Doxapram Hydrochloride Injection

Doxapram Hydrochloride Injection is a sterile solution of doxapram hydrochloride in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of doxapram hydrochloride ($C_{24}H_{30}N_2O_2 \cdot HCl \cdot H_2O$).

Description A clear, colourless liquid.

Identification (1) The light absorption of the solution obtained in the Assay exhibits maxima at 252 nm, 258 nm and 264 nm, and minima at 244 nm, 254 nm and 262 nm (Appendix IV A).

(2) Yields the reactions characteristic of chlorides (Appendix III).

pH value 3.5-5.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Transfer an accurately measured quantity, equivalent to about 100 mg of doxapram hydrochloride, to a 250 ml volumetric flask, dilute with water to volume and mix well. Measure the absorbance of the resulting solution at 258 nm (Appendix IV A). Repeat the procedure using doxapram hydrochloride CRS instead of the substance being examined. Calculate the content of $C_{24}H_{30}N_2O_2 \cdot HCl \cdot H_2O$.

Category As described under Doxapram Hydrochloride.

Strength 5 ml:100 mg

Storage Preserve in tightly closed containers, protected from light.

Doxepin Hydrochloride

$C_{19}H_{21}NO \cdot HCl$ 315.84

[1229-29-4]

Doxepin Hydrochloride is a mixture of *Z*- and *E*-isomers of 3-dibenz[*b*, *e*]oxepin-11(6*H*)ylidene-*N,N*-dimethyl-1-propanamine hydrochloride. It contains not less than 98.5% of $C_{19}H_{21}NO \cdot HCl$, calculated on the dried basis.

Description A white powder; easily hygroscopic, then its colour gradually turned into slight yellow; taste, slightly sweet with local numbness.

Freely soluble in water; soluble in ethanol or chloroform;

insoluble in benzene.

Melting range 185-191°C (Appendix VI C).

Identification (1) The light absorption of a solution of 0.04 mg per ml in methanolic hydrochloric acid (0.01 mol/L) exhibits a maximum at 297 nm, the absorbance is 0.50-0.55 (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of doxepin hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, pH 4.5-6.5 (Appendix VI H).

Z-isomer Carry out the method for gas chromatography (Appendix V E), using a column packed with diatomaceous support coated with 3% of cyanopropylmethyl phenyl methyl silicone fluid (OV-225), maintain the column temperature at 235°C, the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of Z-doxepin, and the resolution factor between the peaks of Z- and E-doxepin is greater than 1.0.

Internal standard Dissolve a quantity of chlorphenamine maleate in methanol to produce a solution of 5 mg per ml.

Procedure Transfer accurately a quantity equivalent to about 25 mg of doxepin hydrochloride, to a 50 ml volumetric flask, add accurately 5 ml of internal standard solution, and a quantity of methanol to dissolve it, dilute with methanol to volume, mix well and inject 1-3 µl into the column. Repeat the operation, using doxepin hydrochloride CRS instead of the substance being examined. Measure the peak areas of Z- and E-doxepin, the percentage of Z-doxepin is 17.0%-23.0%.

Loss on drying When dried to constant weight at 105°C, loses not more than 1.0% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.2 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 31.58 mg of C₁₉H₂₁NO • HCl.

Category Antidopaminergic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Doxepin Hydrochloride Tablets

Doxepin Hydrochloride Tablets

Doxepin Hydrochloride Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of doxepin (C₁₉H₂₁NO).

Description Sugar-coated or film coated tablets with white to slightly yellow core.

Identification (1) The light absorption of the solution obtained in the Assay exhibits a maximum at 297 nm (Appendix IV A).

(2) Triturate a quantity of powdered tablets with water and filter. To the filtrate, add drops of silver nitrate TS; a white curdy precipitate is produced.

Dissolution Carry out dissolution test (Appendix X C, method 1), using 900 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution at exact 45 minutes, filter and use the successive filtrate as the test solution. Dissolve a quantity of doxepin hydrochloride CRS, accurately weighed, in water to produce a solution of 30 µg per ml as the reference solution. Measure the absorbance of the resulting solutions at 292 nm (Appendix IV A). Calculate the dissolution of C₁₉H₂₁NO from each tablet; not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 20 tablets with coating removed. Transfer accurately a quantity of the powdered tablets equivalent to 25 mg of doxepin to a 100 ml volumetric flask, add 1 ml of hydrochloric acid solution (1 mol/L), shake thoroughly and allow to stand for 10 minutes, add 60 ml of methanol, shake well, dilute with methanol to volume and mix well. Filter and discard the initial filtrate, transfer accurately 10 ml of the successive filtrate to a 50 ml volumetric flask, dilute with methanolic hydrochloric acid solution (0.01 mol/L) to volume and mix well. Measure the absorbance of the resulting solution at 297 nm (Appendix IV A), calculate the content of C₁₉H₂₁NO, taking 150 as the value of A (1%, 1 cm).

Category As described under Doxepin Hydrochloride.

Strength 25 mg (calculated as doxepin)

Storage Preserve in tightly closed containers, protected from light.

Doxorubicin Hydrochloride

C₂₇H₂₉NO₁₁ • HCl 579.99

[25316-40-9]

Doxorubicin Hydrochloride is (8S, 10S)-10-[3-Amino-2, 3, 6-trideoxy-α-L-lyxo-hexopyranosyloxy-8-glycoloyl]-7, 8, 9, 10-tetrahydro-6, 8, 11-trihydroxyl-1-methoxyl-5, 12-naphthacenedione hydrochloride.

It contains not less than 98.0% and not more than 102.0% of Doxorubicin Hydrochloride (C₂₇H₂₉NO₁₁ • HCl), calculated on the anhydrous and residual solvent-free basis.

Description A orange-red crystalline powder, hygroscopic. Soluble in water, slightly soluble in methanol.

Identification (1) The retention time of principal peak of Doxorubicin Hydrochloride in the substance being examined in the chromatogram obtained in the Assay is identical with

that the principal peak of Doxorubicin Hydrochloride CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of Doxorubicin Hydrochloride.

(3) To a quantity of the solution of the substance being examined add 5 ml of nitric acid R, add 0.5 ml of water R and heat over a flame for 2 min. Allow to cool and add silver nitrate solution TS. A white precipitate is formed.

Crystallinity Complies with the test for crystallinity (Appendix IX D).

Acidity An aqueous solution of 5 mg per ml, pH 4.5-5.5. (Appendix VI H).

Related substances Carry out the method and use the solution as described under Assay. Adjust the attenuation so that the principal peak height in the chromatogram is about 20%-30% of full scale of chart. Dissolve a quantity of the substance being examined, accurately weighed, in mobile phase to produce solutions of 1.0 mg per ml. Used as the test solutions. Transfer accurately 1 ml to a 100 ml volumetric flask, dilute with the mobile phase to volume and mix well. Used as the reference solution. Inject separately 10 μ l each of the test solution and the reference solution into the column and record the chromatogram for 3.5 times the retention time of the principal peak. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution are not greater than 0.5 times (0.5%) and 2 times (2.0%) of area of the principal peak in the chromatogram obtained with the standard solution.

Residual solvent *ethanol, methanol, acetone, and dichloromethane* Dissolve about 0.2 g, accurately weighed, in 5 ml water in a head-sampling bottle. Encapsulate the bottle. Used as the test solution. Weigh accurately, a quantity of methanol, acetone, ethanol and dichloromethane, separately, dissolve with Dimethyl Sulphoxide to produce stock solution individually. Measure accurately a quantity of each stock solution, dilute with water to obtain a mixed solution containing 2 μ g dichloromethane, 20 μ g methanol, 10 μ g acetone and 0.2 mg ethanol per ml. Measure 5 ml accurately in a head-sampling bottle. Encapsulate the bottle. Used as the reference solution.

Carry out the method for Residual solvent (Appendix VIII P). The gas chromatograph is equipped with a flame-ionization detector and a fused-silica capillary column coated with a layer of 6% cyanopropylphenyl/94% dimethylsiloxane or equivalent phase column. Maintain the temperature of the column at 50°C. The injection port is maintained at a temperature of 140°C. The detector is maintained at a temperature of 250°C. Nitrogen or Helium is used as the carrier gas, the flow rate is 5.0 ml per minute. Head-sampling method is used. The head-sampling condition is 90°C for 30 minutes. The injection volume is 1.0 ml. Inject the reference solution into the column and record the chromatogram. The elution order is methanol, ethanol, acetone and dichloromethane. The resolution factor between main peaks complies with the related requirements. Inject separately each of the test solution and the reference solution into the column and record the chromatogram. Calculate the content of methanol, ethanol, acetone and dichloromethane with respect to the peak area of methanol, ethanol, acetone and dichloromethane obtained in the chromatogram by the external standard method respectively. The content of ethanol is not more than 1.0%. The content of methanol, dichloromethane and acetone comply with requirements.

Water Not more than 4.0% (Appendix VIII M, method 1 A).

Bacterial endotoxin Carry out the test for Bacterial endotoxin (Appendix XI E); less than 2.2 EU per mg.

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of sodium lauryl sulfate solution (weigh about 1.44 g of sodium lauryl sulfate, add 0.68 ml of phosphoric acid, dissolve with 500 ml water)-acetonitrile-methanol(500:500:60) as the mobile phase. The detection wavelength is 254 nm. Dissolve a quantity of doxorubicin hydrochloride CRS and epirubicin hydrochloride CRS in mobile phase to produce a mixed solution containing 50 μ g each of the two substances per ml. Inject 10 μ l of the solution into the column and record the chromatogram. The resolution between doxorubicin and epirubicin is more than 2.0.

Procedure Dissolve a quantity of the substance being examined, accurately weighed, with mobile phase to produce a solution containing 0.1 mg per ml. Inject 10 μ l into the column and record the chromatogram. Repeat the operation, using doxorubicin hydrochloride CRS instead of the substance being examined, calculate the content of doxorubicin hydrochloride ($C_{27}H_{29}NO_{11} \cdot HCl$) with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antitumour.

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Preparation Doxorubicin Hydrochloride for Injection.

Doxorubicin Hydrochloride for Injection

Doxorubicin Hydrochloride for Injection is a sterile mixture of Doxorubicin Hydrochloride and suitable amount of Mannitol or other excipient. It contains not less than 90.0% and not more than 115% of the labelled amount of Doxorubicin Hydrochloride ($C_{27}H_{29}NO_{11} \cdot HCl$).

Description A orange-red loosen mass or powder.

Identification Complies with the test (1) and (3) for Identification described under Doxorubicin Hydrochloride.

Related substances Carry out the method and use the solution as described under Doxorubicin Hydrochloride. Each peak area and the sum of the areas of all peaks other than the principal peak in the chromatogram obtained with the test solution are not greater than 1 time (1.0%) and 3 times (3.0%) of area of the principal peak in the chromatogram obtained with the reference solution.

Content uniformity Complies with the test for content uniformity (Appendix X E), the content of Doxorubicin Hydrochloride in each bottle is calculated by Assay.

Acidity Carry out the method for Acidity described under Doxorubicin Hydrochloride.

Water Carry out the method for Water described under Doxorubicin Hydrochloride.

Bacterial endotoxin Carry out the method for Bacterial endotoxin described under Doxorubicin Hydrochloride.

Sterility Dissolve a quantity of the substance being examined in suitable amount of solvent, transfer to at least 500 ml of sterile 0.9% of sodium chloride solution. Complies with the test for sterility (Appendix XI H, membrane filtration

method).

Other requirements Complies with the general requirements for injection (Appendix I B).

Assay Take 10 packages. Dissolve the substance being examined in each original bottle with mobile phase and dilute to produce a solution containing 0.1 mg per ml. Carry out the Assay described under Doxorubicin Hydrochloride. Calculate the content of Doxorubicin Hydrochloride in each bottle. The average value of these 10 contents is the final result.

Category As described under Doxorubicin Hydrochloride.

Strength Calculated as $C_{27}H_{29}NO_{11} \cdot HCl$
(1) 10 mg (2) 20 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Doxycycline Hyclate

$C_{22}H_{24}N_2O_8 \cdot HCl \cdot \frac{1}{2}C_2H_5OH \cdot \frac{1}{2}H_2O$ 512.93
[24390-14-5]

Doxycycline Hyclate is 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacene-carboxamide monohydrochloride, hemiethanol, hemihydrate. It contains not less than 88.0% and not more than 94.0% of $C_{22}H_{24}N_2O_8$, calculated with reference to the anhydrous, ethanol-free substance.

Description A slightly yellow to yellow crystalline powder; odourless; taste, bitter. Freely soluble in water or methanol; slightly soluble in ethanol or acetone; practically insoluble in chloroform.

Specific optical rotation -105° to -120° measured at $25^\circ C$, in a solution of 10 mg per ml in a mixture of 1 volume of hydrochloric acid solution (9 → 100) and 99 volumes of methanol (Appendix VI E).

Identification (1) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is correspondent with that of doxycycline CRS in the chromatogram.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Doxycycline (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Acidity An aqueous solution of 10 mg per ml, pH 2.0-3.0 (Appendix VI H).

Light absorption The absorbance of a solution of 10 μg per ml in a mixture of 1 volume of hydrochloric acid solution (9 → 100) and 99 volumes of methanol at 349 nm is 0.28-0.31 (Appendix IV A).

Related substances Carry out the method described under

Assay. Dissolve a quantity of the substance being examined, accurately weighed, in 0.01 mol/L hydrochloric acid solution to produce solutions of 0.2 mg per ml as test solution and 4 μg per ml as reference solution. Inject 20 μl of solution (2) into the column, adjust the attenuation so that the principal peak height is 20% of the full scale of the chart. Inject separately 20 μl each of test solution and reference solution, and record the chromatogram for twice the retention time of the principal peak. The peak area of oxytetracycline is not greater than 1/2 of the principal peak area in the chromatogram obtained with reference solution and the peak areas of metacycline and β -doxycycline are not greater than the principal area in the chromatogram obtained with reference solution respectively.

Light absorbing impurities The absorbance of a solution of 10 mg per ml in a mixture of 1 volume of hydrochloric acid solution (9 → 100) and 99 volumes of methanol at 490 nm, is not greater than 0.12 (Appendix IV A).

Ethanol Dilute 0.5 ml of absolute ethanol, accurately measured, with 0.05% (ml/ml) *n*-propanol solution (internal standard solution) to volume in a 100 ml volumetric flask and mix well. Dilute 1.0 ml of the solution, accurately measure, with the internal standard solution to volume in a 10 ml volumetric flask and mix well. Dissolve about 1.0 g, accurately weighed, in internal standard solution, dilute to volume in another 10 ml volumetric flask and mix well. Carry out the method for assay as chromatograph (Appendix V E), using a column packed with porous polymer beads, maintain the column temperature at $135^\circ C$ and the vaporizer and the detector temperature below $150^\circ C$. The resolution factor between the peaks of ethanol and internal standard complies with the related requirement the content of ethanol is 4.3% to 6.0% (g/g).

Water 1.5-3.0% (Appendix VIII M, method 1 A).

Residue on ignition Not more than 0.2% (Appendix VIII N), using 1 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition, not more than 0.002%.

Assay Carry out the method for high performance liquid chromatogram (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.05 mol/L ammonium oxalate solution-dimethylformamide-0.2 mol/L diammonium hydrogen phosphate solution (65:30:5) (adjust pH value to 8.0 ± 0.2 with ammonia TS) as the mobile phase. Maintain the column temperature at $35^\circ C$. Dissolve a mixture of metacycline CRS, oxytetracycline CRS, β -doxycycline CRS and doxycycline CRS, all accurately weighed, in 0.01 mol/L hydrochloric acid solution to produce a solution of 0.08 mg per ml respectively, inject a quantity of the resulting solution into the column. The number of theoretical plates of the column is not less than 1500, calculated with reference to the peak of doxycycline. The resolution factor between the peaks of doxycycline and β -doxycycline complies with the related requirements.

Procedure Dissolve 40 mg, accurately weighed, in 0.01 mol/L hydrochloric acid solution dilute to volume in a 50 ml volumetric flask and mix well. Transfer 5 ml, accurately measured, into another 50 ml volumetric flask, dilute with 0.01 mol/L hydrochloric acid solution to volume and mix well. Inject 20 μl into the column and record the chromatogram. Repeat the operation using doxycycline CRS instead of the substance being examined. Calculate the content of $C_{22}H_{24}N_2O_8$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Tetracycline antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Doxycycline Hyclate Capsules
(2) Doxycycline Hyclate Tablets

Doxycycline Hyclate Capsules

Doxycycline Hyclate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Doxycycline ($C_{22}H_{24}N_2O_8$).

Description Capsules containing slightly yellow to yellow powder or granules.

Identification The contents of capsules comply with the tests for Identification described under Doxycycline Hyclate.

Related substances Carry out the method described under Doxycycline Hyclate. Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation of content in 0.01 mol/L hydrochloric acid to produce a solution of 0.2 mg per ml, filter as test solution. Measure a quantity of test solution and dilute with 0.01 mol/L hydrochloric acid to produce a solution of 4 µg per ml as reference solution.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution at exact 45 minutes and filter. Dilute an accurately measured quantity of the successive filtrate with water to produce a solution of 20 µg per ml. Dissolve an accurately weighed quantity of doxycycline hyclate CRS in water to produce a solution of 20 µg per ml. Measure the absorbance of the resulting solutions at 276 nm (Appendix IV A) Calculate the dissolution of $C_{22}H_{24}N_2O_8$ from each tablet, not less than 85% of the labelled amount is dissolved.

Loss on drying When dried the contents of the capsules to constant weight at 105°C, lose not more than 8.5% of their weight (Appendix VIII L).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed contents equivalent to about 40 mg of doxycycline in the test for weight variation of content in 0.01 mol/L hydrochloric acid solution, dilute to volume in a 50 ml volumetric flask and mix well. Filter, transfer accurately 5 ml of the successive filtrate in another 50 ml volumetric flask and dilute to volume with 0.01 mol/L hydrochloric acid solution. Inject 20 µl into the column. Carry out the Assay described under Doxycycline Hyclate.

Category As described under Doxycycline Hyclate.

Strength 0.1 g (Calculated as $C_{22}H_{24}N_2O_8$)

Storage Preserve in tightly closed containers, stored in a cool and dry place.

Doxycycline Hyclate Tablets

Doxycycline Hyclate Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of doxycycline ($C_{22}H_{24}N_2O_8$).

Description Pale yellow tablets.

Identification (1) To a quantity of powdered tablets equivalent to about 0.5 mg of doxycycline add 2 ml of sulfuric acid, a yellow colour is produced.

(2) The retention time of the principal peak of the substance being examined in the chromatogram obtained in the Assay is correspondent with that of doxycycline CRS in the chromatogram.

Light absorbing impurities To 5 powdered tablets add a mixture of 1 volume of hydrochloric acid solution (9→100) and 99 volumes of methanol to produce a solution of 10 mg per ml and filter. The absorbance of the successive filtrate at 490 nm is not greater than 0.20 (Appendix IV A).

Related substances Dissolve a quantity of the powdered tablets in 0.01 mol/L hydrochloric acid solution to produce two solutions of 0.2 mg per ml as test solution and 4 µg per ml as reference solution, carry out the method of Related substances described under Doxycycline Hyclate.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using water as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution at exact 45 minutes and filter. Dilute a quantity of the successive filtrate with water to produce a solution of 20 µg per ml. Dissolve a quantity of doxycycline Hyclate CRS in water to produce a solution of 20 µg per ml. Measure the absorbance of the resulting solutions at 276 nm (Appendix IV A). Calculate the dissolution of $C_{22}H_{24}N_2O_8$ from each tablet, not less than 85% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Dissolve an accurately weighed quantity, equivalent to about 40 mg of doxycycline, in 0.01 mol/L hydrochloric acid solution, dilute to volume in a 50 ml volumetric flask and mix well. Filter, transfer accurately 5 ml of the successive filtrate to another 50 ml volumetric flask and dilute to volume with 0.01 mol/L hydrochloric acid solution. Inject 20 µl into the column, carry out the Assay described under Doxycycline Hyclate.

Category As described under Doxycycline Hyclate.

Strength Calculated as $C_{22}H_{24}N_2O_8$

(1) 0.05 g (2) 0.1 g

Storage Preserve in tightly closed containers, protected from light.

Dried Calcium Sulfate

$CaSO_4 \cdot \frac{1}{2} H_2O$ 145.15

Dried Calcium Sulfate contains not less than 95.0% of $CaSO_4 \cdot \frac{1}{2} H_2O$.

Description A white fine powder; odourless; tasteless; hygroscopic, forming fine particulates, and the solidifiability is lost.

Slightly soluble in water, insoluble in ethanol, soluble in dilute hydrochloric acid.

Identification Dissolve in dilute hydrochloric acid, the solution yields the reactions characteristic of calcium salts and sulfates (Appendix III).

Fineness of the particles 20 g should pass through No. 5 sieve completely and not less than 80% should pass through No. 6 sieve.

Alkalinity Shake 3.0 g with 10 ml of water, add 1 drop of phenolphthalein IS solution; no pink colour is produced.

Solidification Stir 10 g with 10 ml water thoroughly, a white and compact solid is solidified within 5 minutes. Press the edge of solid with finger; after 3 hours; no chippings are separated.

Loss weight on ignition When ignited to constant weight, loses not less than 0.5% and not more than 8.0% of its weight.

Assay Dissolve about 0.15 g accurately weighed in a conical flask with 15 ml of water and 5 ml of dilute hydrochloric acid by heating gently. Cool, add 75 ml of water, 20 ml of sodium hydroxide TS and 0.1 g calcon IS mixture. Titrate with disodium edetate (0.05 mol/L) VS, until the colour turns from violet red to pure blue. Each ml of disodium edetate (0.05 mol/L) VS is equivalent to 7.258 mg of $\text{CaSO}_4 \cdot \frac{1}{2} \text{H}_2\text{O}$.

Category Solidifying agent for orthopaedics.

Storage Preserve in tightly closed containers.

Econazole Nitrate

$\text{C}_{18}\text{H}_{15}\text{Cl}_3\text{N}_2 \cdot \text{HNO}_3$ 444.70

[68979-31-9]

Econazole Nitrate is 1-[2,4-dichloro- β (4-chlorobenzyloxy) phenethyl] imidazole nitrate. It contains not less than 98.5% of $\text{C}_{18}\text{H}_{15}\text{Cl}_3\text{N}_2 \cdot \text{HNO}_3$, calculated on the dried basis.

Description White to slightly yellow crystals or a crystalline powder; odourless.

Freely soluble in methanol; slightly soluble in chloroform; very slightly soluble in water.

Melting range 163-167°C, with decomposition (Appendix VI C).

Identification (1) To about 3 mg add two drops of sulfuric acid and 1 drop of diphenylamine TS, a deep blue colour develops.

(2) The light absorption (Appendix IV A) of the solution of about 0.4 mg per ml in hydrochloric acid solution (0.1 mol/L) and methanol (1:9) exhibits maxima at 265 nm, 272 nm and 280 nm.

(3) The infrared absorption spectrum (Appendix VI C) is concordant with the reference spectrum of econazole nitrate (Appendix XVI).

(4) Weigh about 20 mg and carry out the oxygen flask combustion (Appendix VII C) when the combustion is complete, using 5 ml of solution sodium hydroxy TS as absorbing solution. shake thoroughly. Dilute the resulting solution to 20 ml with water and acidify with dilute nitric acid. This solution yields reactions characteristic of chlorides (Appendix III).

Acidity To 1 g add 50 ml of water, heat for 5 minutes on 70°C water bath. Cool immediately and filter, the pH of filtrate is 3.0-4.5.

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1%; use 1.0 g. (Appendix VIII N).

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition, not more than 0.002%.

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of hexane, chloroform, methanol and ammonia (60:30:10:1) as the mobile phase. Apply separately to the plate 25 μl of each of the two solutions in methanol containing (1) 20 mg and (2) 100 μg per ml. After developing and removal of the plate, allow it to dry in a current of air, and expose the plate to iodine vapour. Any secondary spot in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Assay Dissolve 0.3 g accurately weighed in 30 ml of acetic acid and carry out the potentiometric titration (Appendix VII

A), titrate with perchloric acid (0.1 mol/L) VS. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 44.47 mg of $C_{18}H_{15}Cl_3N_2O \cdot HNO_3$.

Category Antifungal.

Storage Preserve in tightly closed containers.

Preparations (1) Econazole Nitrate Cream
(2) Econazole Nitrate Solutions
(3) Econazole Nitrate Spray
(4) Econazole Nitrate Suppository

Econazole Nitrate Cream

Econazole nitrate cream contains not less than 90.0% and not more than 110.0% of labelled amount of Econazole Nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$)

Description A white cream.

Identification Carry out the method for thin-layer chromatography (Appendix V B) using silica gel G as the coating substance and the isopropyl ether as the mobile phase. Apply separately to the plate 5 μ l each following solutions. For solution (1) to about 2 g add 20 ml of methanol, heat on water bath to melt, allow it to cool on ice bath and filter, evaporate the filtrate to dryness and dissolve the residue in 2 ml of methanol. Solution (2) containing 20 mg of econazole nitrate CRS in 2 ml of methanol. After developing and removal of the plate, allow it to dry in a current of air and expose the plate to iodine vapour. The position of principal spot obtained with the solution (1) corresponds to that obtained with solution (2).

Other requirements Complies with the general requirements for cream (Appendix I F).

Assay Dissolve a quantity (equivalent to 40 mg econazole nitrate) accurately weighed, with 40 ml of chloroform in a conical flask with stopper, by shaking, add 20 ml of water and 5 ml of dilute sulfuric acid and 1 ml of mixed indicator of dimethyl yellow-solvent blue IS, shake well and titrate with sodium diethyl sulfosuccinate VS, until the colour of chloroform layer forms from green to red-gray colour. Repeat the operation using a quantity containing 40 mg of econazole nitrate CRS instead of substance being examined. Calculate the content of $C_{18}H_{15}Cl_3N_2O \cdot HNO_3$ accordingly.

Category As described under econazole nitrate.

Strength 10 g \pm 0.1 g

Storage Preserve in tightly closed containers and stored in a cool place.

Econazole Nitrate Solution

Econazole nitrate solution contains not less than 90.0% and not more than 110.0% of labelled amount of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$).

Description A white to pale yellow clear liquid.

Identification Evaporate a quantity of this solution to dryness, the residue complies with tests (1), (2) and (4) for identification described under Econazole Nitrate.

Weight variation of contents Complies with the general requirement of test for weight variation of contents

(Appendix X F).

Assay Shake well 2 ml, accurately measured with 30 ml of chloroform and 20 ml of water in a conical flask with stopper, carry out the Assay described under econazole nitrate cream beginning at the words "add 5 ml of dilute sulfuric acid" and calculate the content of $C_{18}H_{15}Cl_3N_2O \cdot HNO_3$.

Category As described under econazole nitrate.

Strength 1%

Storage Preserve in well closed containers.

Econazole Nitrate Spray

Econazole Nitrate Spray contains not less than 90.0% and not more than 110.0% of labelled amount of Econazole Nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$).

Description A colourless to pale yellow and clear liquid, with fragrance.

Identification (1) To 1 ml add 2-3 drops of trinitrophenol TS, a yellowish-white precipitate is produced.
(2) Add 1 ml of diphenylamine TS along the wall of test tube to 2 ml, a blue colour develops between two layers.

Minimum Fill Complies with the general requirement of the test for Minimum fill (Appendix X F).

Assay Dilute a quantity of 15 ml (equivalent to 150 mg of econazole nitrate), accurately measured, to 100 ml with ethanol and shake well, dilute 5 ml of resulting solution to 100 ml with ethanol and shake well. To 5 ml add a mixture of hydrochloric acid solution 0.1 mol/L and methanol (1:9) to 50 ml. Determine the absorbance of the resulting solution at 222 nm and 234 nm (Appendix IV A), using the same solvent as blank. Repeat the operation using econazole nitrate CRS instead of the substance being examined, calculate the difference of the absorbance at $A_{234nm} - A_{222nm}$ respectively. Calculate the content of $C_{18}H_{15}Cl_3N_2O \cdot HNO_3$ accordingly.

Category As described under Econazole Nitrate.

Strength 1%

Storage Preserve in well closed containers.

Econazole Nitrate Suppositories

Econazole nitrate suppositories contains not less than 90.0% and not more than 110.0% of labelled amount of econazole nitrate ($C_{18}H_{15}Cl_3N_2O \cdot HNO_3$).

Description White to slight yellow suppositories.

Identification (1) Dissolve in 15 ml of hexane by warming on water bath, allow it cool in air, discard hexane and wash the residue two times with 10 ml of hexane, Evaporate residual hexane to dryness by heating on water bath. Dissolve 0.1 g of residue in 5 ml of methanol as the test solution. Dissolve about 0.1 g of econazole nitrate CRS in 5 ml of methanol as the reference solution. Carry out the method for thin-layer chromatography using silica gel as the coating substance and as mobile phase. Apply separately to the plate 5 μ l of each two solution. After removal of the plate, allow it to dry in air, and expose the plate to iodine

vapour until a brown spot appears in the chromatogram obtained with.

(2) Comply with tests (1) and (2) for Identification described under econazole nitrate using the residue obtained from identification (1).

Other requirements Comply with the general requirements for suppositories.

Assay Mix well 10 of suppositories accurately weighed and weigh a quantity (equivalent to 40 mg of Econazole Nitrate), carry out the assay described under Econazole Nitrate Cream.

Category As described under Econazole Nitrate.

Strength (1) 50 mg (2) 150 mg

Storage Preserve in well closed containers and stored in a cool place.

Emetine Hydrochloride

$C_{29}H_{40}N_2O_4 \cdot 2HCl \cdot 7H_2O$ 679.68 [316-42-7]

Emetine Hydrochloride is 6', 7', 10, 11-tetramethoxyemetan dihydrochloride heptahydrate. It contains not less than 98.0% of $C_{29}H_{40}N_2O_4 \cdot 2HCl$, calculated on the dried basis.

Description A white to slightly yellowish crystalline powder; odourless; taste, bitter; deteriorated on exposure to light.

Freely soluble in water, ethanol or chloroform.

Specific optical rotation $+16^\circ$ to $+19^\circ$, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) To about 5 mg add 1 ml of ammonium molybdate in sulfuric acid TS, and mix well; a bright-green colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the spectrum of emetine hydrochloride CRS.

(3) Yields the reactions characteristic of chlorides (Appendix III).

Acidity Dissolve 0.10 g in 10 ml of water, add 1 drop of methyl red IS. If the solution becomes pink, it changes to yellow on the addition of 0.5 ml of sodium hydroxide (0.02 mol/L) VS.

Cephaeline Protect the operations from light. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-diethylamine (9:1) as the mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 10 mg per ml of the substance being examined and (2) 0.2 mg per ml of cephaeline CRS. Develop the chromatogram until the solvent front has moved about 12 cm. Remove the plate, dry in air. Spray the plate with 2.5 mol/L sodium hydroxide solution, and dry at 50°C for 5 minutes. Then spray the plate with diazotized *p*-nitroaniline TS. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more

intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C , loses not less than 15% and not more than 19% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve 0.2 g, accurately weighed, in 20 ml of acetic anhydride, add 4 ml of mercuric acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 27.68 mg of $C_{29}H_{40}N_2O_4 \cdot 2HCl$.

Category Amoebacide.

Storage Preserve in tightly closed containers, protected from light.

Preparation Emetine Hydrochloride Injection

Emetine Hydrochloride Injection

Emetine Hydrochloride Injection is a sterile solution of Emetine Hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of $C_{29}H_{40}N_2O_4 \cdot 2HCl \cdot 7H_2O$.

Description A clear, colourless liquid, deteriorated on exposure to light.

Identification Evaporate the injection to dryness, the residue complies with the tests (1), and (3) for Identification described under Emetine Hydrochloride.

pH value 2.6-4.0 (Appendix VI H).

Cephaeline Protect the operations from light. Evaporate 1 ml of the injection on a water bath to dryness by a current of nitrogen. Dissolve the residue in methanol to produce a solution of 10 mg per ml, use this solution as solution (1). Carry out the test for Cephaeline described under Emetine Hydrochloride. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Dilute an accurately measured quantity equivalent to about 0.3 g of emetine hydrochloride to 20 ml with water, add 10 ml of sodium hydroxide TS. Extract with 30 ml of ether followed by several quantities, each of 15 ml, of ether until alkaloids are completely extracted. Wash the combined ether extracts with two 10 ml quantities of water. Extract each washing with the same 20 ml of ether. Combine the two ether extracts. Add 20 ml of hydrochloric acid (0.1 mol/L) VS, measured accurately, shake and extract, allow to separate, retaining the acidic layer. Wash the ether layer with several quantities, each of 20 ml, of water. Combine the washings and acidic layer. Add 1 to 2 drops of methyl red IS, titrate with sodium hydroxide (0.1 mol/L) VS. Each ml hydrochloric acid (0.1 mol/L) VS is equivalent to 33.99 mg of $C_{29}H_{40}N_2O_4 \cdot 2HCl \cdot 7H_2O$.

Category As described under Emetine Hydrochloride.

Strength (1) 1 ml:30 mg (2) 1 ml:60 mg

Storage preserve in well closed containers, protected from light.

Enalapril Maleate

$C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ 492.52

Enalapril Maleate is 1-*N*-[(*S*)-1-carboxy-3-phenylpropyl]-*L*-alanyl]-*L*-proline 1'-ethylester, maleate (1 : 1). It contains not less than 98.5% of $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; slightly hygroscopic.

Freely soluble in methanol, sparingly soluble in water, slightly soluble in ethanol or acetone; practically insoluble in chloroform.

Specific optical rotation -41° to -43.5° , in a solution of 50 mg per ml in methanol (Appendix VI E).

Identification (1) To about 20 mg, add 1 ml of sulfuric acid dilute TS and a few drops of potassium permanganate TS, a red colour disappears immediately. (2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum (Appendix XIII).

Acidity Dissolve 0.1 g in 10 ml of water, pH 2.0-2.8 (Appendix VI H).

Related substances Prepare a solution of 2 mg per ml in the mobile phase as the test solution. Measure accurately a quantity of the test solution, dilute with the mobile phase to produce the reference solution of about 40 μ g per ml. Dissolve separately a quantity of enalapril maleate CRS and enalaprilat CRS, accurately weighed, in water respectively to produce each of solution of 0.1 mg per ml; dissolve a quantity of enalapril diketopiperazine CRS, accurately weighed, in the mobile phase, ultrasonicate to produce a solution of 0.1 mg per ml. Measure accurately a quantity of above three solutions, dilute with water to produce a mixed solution of 0.02 mg per ml containing enalapril maleate, enalaprilat and enalapril diketopiperazine separately. Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel and a mixture of acetonitrile-phosphate BS [0.01 mol/L potassium dihydrogen phosphate solution, adjust to pH 2.2 with phosphoric acid] (25 : 75) as the mobile phase. Detection wavelength is 215 nm. The temperature of the column is maintained at 50°C. Inject 20 μ l of the mixed solution into the column, the number of the theoretical plates of the column is not less than 300, calculated with reference to the peak of enalapril. The tailing factor of the peak of enalapril is not more than 2.0. The resolution factor between the peaks of maleate and enalaprilat complies with related requirements; the resolution factor between the peaks of enalaprilat, enalapril and enalapril diketopiperazine is not less than 4.0. Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 15% of the full scale of the chart. Inject separately 20 μ l each of the test solution and the reference solution into the column and record the chromatogram for 3 times the retention time of the peak of enalapril. The sum of the areas of all peaks other than the peak of the principal peak and maleate peak in the

chromatogram obtained with test solution is not greater than the area of the principal peak in the chromatogram obtained with the reference solution.

Acetonitrile Dissolve a quantity of the substance being examined, accurately weighed, in dimethylformamide to produce the test solution of 100 mg per ml. Dissolve a quantity of acetonitrile, accurately weighed, in dimethylformamide to produce the reference solution of 40 μ g per ml. Carry out the method for determination of residual solvents (Appendix VIII P), using a column coated with polyethylene glycol 20000 as the stationary phase, a flame ionization detector is used. Maintain the temperature of the column at 60°C for 2 min, then raise the temperature at a rate of 10°C per minute to 200°C and maintain at 200°C for 5 min; maintain injection port temperature at 200°C and detector temperature at 250°C. The number of the theoretical plates of the column is not less than 10000, calculated with reference to the peak of acetonitrile. Inject separately 1 μ l each of the test solution and the reference solution into the column and record the chromatogram. The content of acetonitrile in test solution complies with related requirement.

Loss on drying When dried in vacuum for 4 hours at 50°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Weigh accurately about 0.4 g, add 15 ml of glacial acetic acid and 5 ml of anhydrous dioxane (to 500 ml of dioxane, add 10 g of dried 4A molecular sieve and allow to stand for a night), dissolve by warming, add 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS to blue as end point. Perform a blank determination. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 49.25 mg of $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$.

Category Antihypertensive.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Enalapril Maleate Tablets
(2) Enalapril Maleate Capsules

Enalapril Maleate Capsules

Enalapril Maleate Capsules contain not less than 90.0% of and not more than 110.0% of the labelled amount of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$).

Description Capsules containing white or almost white power.

Identification (1) To a quantity of the contents of the capsules (equivalent to about 20 mg of enalapril maleate), add 2 ml of sulfuric acid dilute TS, stir and filter. Add a few drops of potassium permanganate TS to the filtrate, a red colour disappears immediately.

(2) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of enalapril maleate CRS in the chromatogram of the reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Transfer the content of 1 capsule in a 50 ml (for strength 10 mg) or 25 ml (for

strength 5 mg) volumetric flask, wash the shell with water in divided portions, transfer the washings to the same volumetric flask, add a quantity of water, shake to dissolve enalapril maleate, dilute with water to volume, mix well and filter. Carry out the procedure described under Assay, beginning at the words "Inject 20 μ l of the successive filtrate into the column...". Calculate the content of $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 30 minutes and filter, using the successive filtrate as the test solution. Dissolve a quantity of enalapril maleate CRS, accurately weighed, in water to produce a solution of 20 μ g per ml (for strength 10 mg) or 10 μ g per ml (for strength 5 mg) as the reference solution. Carry out the procedure described under Assay, inject 20 μ l of the above two solutions into the column, and record the chromatogram. Calculate the dissolution of $C_{18}H_{28}N_2O_5 \cdot C_4H_4O_4$ from each capsule. Not less than 75% of the labelled amount is dissolved.

Related substances Weigh accurately a quantity of the powdered contents of capsules, dissolve in the mobile phase to produce a solution containing enalapril maleate of 2 mg per ml as the test solution. Measure accurately a quantity of the solution, dilute with the mobile phase to produce a solution containing enalapril maleate of 0.1 mg per ml as the reference solution. Carry out the procedure described under Assay, Inject 20 μ l of reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 15% of the full scale of the chart. Inject 20 μ l of test solution into the column and record the chromatogram for 3 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak and maleate peak in the chromatogram obtained with test solution is not greater than the area of the principal peak in the chromatogram obtained with reference solution.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octasilane bonded silica gel, and a mixture of acetonitrile-phosphate BS [0.01 mol/L potassium dihydrogen phosphate solution, adjust to pH 2.2 with phosphoric acid] (25 : 75) as the mobile phase. Detection wavelength is 215 nm; the temperature of the column is maintained at 50°C. Dissolve separately a quantity of enalapril maleate CRS and enalaprilat CRS, accurately weighed, in water respectively to produce each of solution of 0.1 mg per ml; dissolve a quantity of enalapril diketopiperazine CRS, accurately weighed, in the mobile phase, ultrasonicate to produce a solution of 0.1 mg per ml. Measure accurately a quantity of above three solutions, dilute with water to produce a mixed solution of 0.02 mg per ml containing enalapril maleate, enalaprilat and enalapril diketopiperazine separately. Inject 20 μ l of the mixed solution into the column, the number of the theoretical plates of the column is not less than 300, calculated with reference to the peak of enalapril. The tailing factor of the peak of enalapril is not more than 2.0. The resolution factor between the peaks of maleate and enalaprilat complies with related requirements; the resolution factor between the peaks of enalaprilat, enalapril and enalapril diketopiperazine is not less than 4.0.

Procedure Weigh accurately the contents of 20 capsules. Triturate an accurately weighed quantity equivalent to about 20 mg of enalapril maleate into a 100 ml volumetric flask,

add a quantity of water, shake to dissolve enalapril maleate, dilute with water to volume, mix well and filter. Inject 20 μ l of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of enalapril maleate CRS, accurately weighed, in water to produce a solution of 0.2 mg per ml, repeat the operation. Calculate the content of $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ with respect to peak area obtained in the chromatogram by external a standard method.

Category As described under Enalapril Maleate.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Enalapril Maleate Tablets

Enalapril Maleate Tablets contain not less than 90% of and not more than 110.0% of the labelled amount of enalapril maleate ($C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$).

Description White tablets.

Identification (1) To a quantity of powdered tablets (equivalent to about 20 mg of enalapril maleate) add 2 ml of sulfuric acid dilute TS, stir and filter. Add a few drops of potassium permanganate TS to the filtrate, a red colour disappears immediately.

(2) The retention time of the principal peak of the substance being examined in the chromatogram of the test solution is identical with that of enalapril maleate CRS in the chromatogram of the reference solution.

Content uniformity Comply with the requirements for content uniformity (Appendix X E). Place 1 tablet in a 50 ml (10 mg) or 25 ml (5 mg) volumetric flask, add a quantity of water, shake to dissolve enalapril maleate, dilute with water to volume, mix well and filter. Carry out the procedure described under Assay, beginning at the words "Inject 20 μ l of the successive filtrate into the column...". Calculate the content of $C_{18}H_{28}N_2O_5 \cdot C_4H_4O_4$.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 500 ml of water as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 30 minutes and filter, using the successive filtrate as the test solution. Dissolve a quantity of enalapril maleate CRS, accurately weighed, in water to produce a solution of 20 μ g per ml (for strength 10 mg) or 10 μ g per ml (for strength 5 mg) as the reference solution. Carry out the procedure described under Assay, inject 20 μ l of the above two solutions into the column, and record the chromatogram. Calculate the dissolution of $C_{18}H_{28}N_2O_5 \cdot C_4H_4O_4$ from each tablet. Not less than 75% of the labeled amount is dissolved.

Related substances Weigh accurately a quantity of the powdered tablets, dissolve in the mobile phase to produce a solution containing enalapril maleate of 2 mg per ml as the test solution. Measure accurately a quantity of the solution, dilute with the mobile phase to produce a solution containing enalapril maleate of 0.1 mg per ml as the reference solution. Carry out the procedure described under Assay, Inject 20 μ l of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 15% of the full scale of the chart. Inject 20 μ l of test solution into the column and record the chromatogram for 3 times the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak and maleate peak in the chromatogram obtained with test solution is not greater than the area of the

principal peak in the chromatogram obtained with reference solution.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel, and a mixture of acetonitrile-phosphate BS [0.01 mol/L potassium dihydrogen phosphate solution, adjust to pH 2.2 with phosphoric acid] (25 : 75) as the mobile phase. Detection wavelength is 215 nm; the temperature of the column is maintained at 50°C. Dissolve separately a quantity of enalapril maleate CRS and enalaprilat CRS, accurately weighed, in water respectively to produce each of solution of 0.1 mg per ml; dissolve a quantity of enalapril diketopiperazine CRS, accurately weighed, in the mobile phase, ultrasonicate to produce a solution of 0.1 mg per ml. Measure accurately a quantity of above three solutions, dilute with water to produce a mixed solution of 0.02 mg per ml containing enalapril maleate, enalaprilat and enalapril diketopiperazine separately. Inject 20 µl of the mixed solution into the column, the number of the theoretical plates of the column is not less than 300, calculated with reference to the peak of enalapril. The tailing factor of the peak of enalapril is not more than 2.0. The resolution factor between the peaks of maleate and enalaprilat complies with related requirements; the resolution factor between the peaks of enalaprilat, enalapril and enalapril diketopiperazine is not less than 4.0.

Procedure Weigh accurately 20 tablets. Triturate an accurately weighed quantity equivalent to about 20 mg of enalapril maleate into a 100 ml volumetric flask, add a quantity of water, shake to dissolve enalapril maleate, dilute with water to volume, mix well and filter. Inject 20 µl of the successive filtrate into the column, record the chromatogram. Dissolve a quantity of enalapril maleate CRS, accurately weighed, in water to produce a solution of 20 µg per ml, repeat the operation. Calculate the content of $C_{20}H_{28}N_2O_5 \cdot C_4H_4O_4$ with respect to peak area obtained in the chromatogram by external standard method.

Category As described under Enalapril Maleate.

Strength (1) 5 mg (2) 10 mg

Storage Preserve in tightly closed containers, protected from light.

Enoxacin

$C_{15}H_{17}FN_4O_3 \cdot 1\frac{1}{2}H_2O$ 347.35

Enoxacin is 1-ethyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-1,8-naphthyridine-3-carboxylic acid sesquihydrate. It contains not less than 98.5% and not more than 102.0% of $C_{15}H_{17}FN_4O_3$, calculated on the dried basis.

Description An almost white to slightly yellow crystalline powder; odourless; taste, bitter.

Slightly soluble in methanol; very slightly soluble in ethanol; insoluble in water; freely soluble in glacial acetic acid or sodium hydroxide TS.

Melting range 222-227°C, with decomposition (Appendix VI C).

Identification (1) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of enoxacin CRS.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of enoxacin (Appendix XVI).

Clarity and colour of solution Dissolve 0.5 g in 10 ml sodium hydroxide TS, the solution is clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₄ or YG₄ (Appendix IX A, method 1).

Related substances Dissolve about 50 mg of the substance being examined in 20 ml of 0.1 mol/L hydrochloride solution in a 100 volumetric flask, dilute with mobile phase to volume and mix well (solution 1). Measure accurately a quantity, dilute with mobile phase to produce a solution of 5 µg per ml (solution 2). Carry out the method described under the Assay. Inject 20 µl of solution (2) into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 20 µl of above two solutions, and record the chromatogram for twice the retention time of the principal peak. The sum of the areas of all peaks other than the principal peak in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Loss on drying When dried to constant weight at 105°C, loses not less than 7.8% and not more than 9.0% (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N), using 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Carry out the method for high performance liquid chromatograph (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.025 mol/L phosphoric acid solution adjust to pH 3.5 with triethylamine-methanol-acetonitrile (80 : 10 : 10) as the mobile phase. Detection wavelength is 269 nm and the number of the theoretical plates of the column is not less than 2000, calculated with reference to the peak of enoxacin. The resolution factor between the peaks of enoxacin and the neighbour impurity complies with the related requirements.

Procedure Dissolve about 25 mg of the substance being examined, accurately weighed, in 20 ml of 0.1 mol/L hydrochloride solution in a 100 volumetric flask, dilute with mobile phase to volume and mix well. Measure accurately 5 ml of the solution in a 25 ml volumetric flask, dilute with mobile phase to volume and mix well. Inject 20 µl of the solution into the column. Repeat the operation, using enoxacin CRS instead of the substance being examined, calculate the content of $C_{15}H_{17}FN_4O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category Antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Preparation (1) Enoxacin Capsules
(2) Enoxacin Eye Drops

- (3) Enoxacin Cream
(4) Enoxacin Tablets

Enoxacin Capsules

Enoxacin Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of enoxacin ($C_{15}H_{17}FN_4O_3$).

Description Capsules containing white to slightly yellow granules or powder.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of enoxacin CRS.

(2) Dissolve a quantity of the contents in 0.1 mol/L sodium hydroxide solution to produce a solution of 4 µg per ml and filter. The light absorption of the filtrate exhibits two maxima at 266 nm and 346 nm (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of diluted hydrochloric acid solution (to 24 ml of dilute hydrochloric acid add water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw the solution after exactly 30 minutes and filter. Dilute a quantity of successive filtrate, accurately measured, with the diluted hydrochloric acid solution to produce a solution of about 4 µg per ml. Measure the absorbance of the resulting solution at 266 nm (Appendix IV A). Dissolve a quantity of enoxacin CRS, accurately weighed, in the diluted hydrochloric acid solution to produce a solution of about 4 µg per ml. Measure the absorbance in the same manner. Calculate the dissolution of $C_{15}H_{17}FN_4O_3$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately a quantity of the mixed and finely powdered contents obtained in the test for Weight variation of contents, equivalent to about 25 mg of enoxacin, to a 100 ml volumetric flask, add 20 ml of 0.1 mol/L hydrochloric acid solution, shake for 15 minutes to dissolve enoxacin, dilute with mobile phase to volume, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with mobile phase to volume and mix well. Carry out the method described under Enoxacin, using the resulting solution.

Category As described under Enoxacin.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Enoxacin Cream

Enoxacin Cream contains not less than 90.0% and not more than 110.0% of the labelled amount of enoxacin ($C_{15}H_{17}FN_4O_3$).

Description A white to pale yellow cream.

Identification (1) The retention time of principal peak of the substance being examined in the chromatogram obtained in the Assay is identical with that of enoxacin CRS.

(2) To a quantity add a quantity of 0.1 mol/L sodium hydroxide solution, heat in a water bath at 50-60°C to produce

a solution of 4 µg per ml. Cool in an ice bath to solidify the matrix, filter. The light absorption of the filtrate exhibits two maxima at 268 nm and 340 nm (Appendix IV A).

Other requirement Complies with the general requirements for cream (Appendix I F).

Assay Weigh accurately a quantity equivalent to about 10 mg of enoxacin to a 50 ml beaker, add about 20 ml of 0.1 mol/L hydrochloric acid solution, stir to dissolve enoxacin. Transfer the solution to a 100 ml volumetric flask, dilute to volume with methanol, mix well and filter. Measure accurately 5 ml of the successive filtrate to a 10 ml volumetric flask, dilute with mobile phase to volume and mix well. Carry out the method described under Enoxacin, using the resulting solution.

Category As described under Enoxacin.

Strength 10 g ± 0.1 g

Storage Preserve in tightly closed containers, stored in a dry and cool place.

Enoxacin Eye Drops

Enoxacin Eye Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of enoxacin ($C_{15}H_{17}FN_4O_3$).

Description A colourless to slightly yellow, clear liquid.

Identification (1) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of enoxacin CRS.

(2) The light absorption of a solution of 4 µg per ml in 0.1 mol/L sodium hydroxide solution exhibits two maxima at 266 nm and 346 nm (Appendix IV A).

pH value 4.5-5.5 (Appendix VI H).

Colour Any colour produced is not more intense than that of reference solution Y₂ or YG₂ (Appendix IX A, method 1).

Other requirements Comply with the general requirements for Eye preparation (Appendix I G).

Assay Dilute an accurately measured quantity of drops with mobile phase to produce a solution of 50 µg of enoxacin per ml, shake well, Carry out the method described under Assay of Enoxacin.

Category As described under Enoxacin.

Strength 8 ml ± 24 mg

Storage Preserve in tightly closed containers, stored in a cool place and protected from light.

Enoxacin Tablets

Enoxacin Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of enoxacin ($C_{15}H_{17}FN_4O_3$).

Description Almost white or slightly yellow tablets or film coated tablets with almost white or slightly yellow core.

Identification (1) The retention time of principal peaks of the substance being examined in the chromatogram obtained in the Assay is identical with that of enoxacin CRS.

(2) Dissolve a quantity of the powdered tablets in 0.1 mol/L sodium hydroxide solution to produce a solution of 4 µg of

enoxacin per ml and filter. The light absorption of the filtrate exhibits two maxima at 266 nm and 346 nm. (Appendix IV A).

Dissolution Carry out the dissolution test (Appendix X C, method 1), using 900 ml of diluted hydrochloric acid solution (to 24 ml of dilute hydrochloric acid add water to 1000 ml) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Dilute a quantity of successive filtrate, accurately measured, with the diluted hydrochloric acid solution to produce a solution of about 4 µg per ml. Measure the absorbance of the resulting solution at 266 nm (Appendix IV A). Dissolve a quantity of enoxacin CRS, accurately weighed, in the diluted hydrochloric acid solution to produce a solution of about 4 µg per ml. Measure the absorbance in the same manner. Calculate the dissolution of $C_{15}H_{17}FN_4O_3$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder finely 10 tablets. Weigh accurately a quantity of the powder equivalent to about 25 mg of enoxacin to a 100 ml volumetric flask, add 20 ml of 0.1 mol/L hydrochloric acid solution, shake thoroughly to dissolve enoxacin, dilute to volume with mobile phase and mix well, filter. Measure accurately 5 ml of the successive filtrate to a 25 ml volumetric flask, dilute with mobile phase to volume and mix well. Carry out the method described under Enoxacin, using the resulting solution.

Category As described under Enoxacin.

Strength (1) 0.1 g (2) 0.2 g

Storage Preserve in tightly closed containers, protected from light.

Ephedrine Hydrochloride

$C_{10}H_{15}NO \cdot HCl$ 201.70

[50-98-6]

Ephedrine Hydrochloride is (1R, 2S) -2-methyl-amino-1-phenylpropane-1-ol. It contains not less than 99.0% of $C_{10}H_{15}NO \cdot HCl$, calculated on the dried basis.

Description White needle crystals or a crystalline powder; odorless; taste, bitter.

Freely soluble in water; soluble in ethanol; insoluble in chloroform or ether.

Melting point 217-220°C (Appendix VI C).

Specific optical rotation -33.0° to -35.5°, in an aqueous solution of 50 mg per ml (Appendix VI E).

Identification (1) Dissolve 10 mg in 1 ml of water, add 2 drops of copper sulfate TS and 1 ml of 20% sodium hydroxide solution, a bluish-violet colour is produced. Add 1 ml of ether, shake and allow to stand; a purple colour is produced in the ethereal layer and a blue colour is produced in the aqueous layer.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ephedrine hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

Clarity of solution A solution of 1.0 g in 20 ml of water is clear.

Acidity or alkalinity Dissolve 1.0 g in 20 ml of water, add 1 drop of methyl red IS; not more than 0.10 ml of either sulfuric acid (0.01 mol/L) VS or sodium hydroxide (0.02 mol/L) VS is required to change the colour of the solution.

Sulfate Carry out the limit test for sulfates (Appendix VIII B), using 1.0 g. Any opalescence produced is not more intense than that of a reference using 1.0 ml of potassium sulfate standard solution (0.010%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of sodium acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve 0.15 g, accurately weighed, in 10 ml of glacial acetic acid by warming, add 4 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to emerald green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.17 mg of $C_{10}H_{15}NO \cdot HCl$.

Category β_2 Adrenergic drug.

Storage Preserve in tightly closed containers.

Preparation (1) Ephedrine Hydrochloride Injection
(2) Ephedrine Hydrochloride Nasal Drops

Ephedrine Hydrochloride Injection

Ephedrine Hydrochloride Injection is a sterile solution of ephedrine hydrochloride in Water for Injection. It contains not less than 95.0% and not more than 105.0% of the labelled amount of ephedrine hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

Description A colourless, clear liquid.

Identification Complies with the tests for Identification (1) and (3) described under Ephedrine Hydrochloride.

pH value 4.5-6.5 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Measure accurately a quantity equivalent to about 0.15 g of ephedrine hydrochloride. Evaporate it to dryness on a water bath, dry at 105°C for 1 hour and cool to room temperature. Dissolve the residue in 10 ml of glacial acetic acid, add 5 ml of mercuric acetate TS, 2 ml of acetic anhydride and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS to an emerald green colour. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.17 mg of $C_{10}H_{15}NO \cdot HCl$.

Category As described under Ephedrine Hydrochloride.

Strength 1 ml:30 mg

Storage Preserve in well closed containers, protected from light.

Ephedrine Hydrochloride Nasal Drops

Ephedrine Hydrochloride Nasal Drops contain not less than 90.0% and not more than 110.0% of the labelled amount of Ephedrine Hydrochloride ($C_{10}H_{15}NO \cdot HCl$).

Description A clear, colourless liquid.

Identification Comply with the tests for Identification described under Ephedrine Hydrochloride.

pH value pH 5.0-7.0 (Appendix VI H).

Other requirements Comply with the general requirements for nasal preparations (Appendix I R).

Assay Measure accurately 2 ml, equivalent to about 20 mg of Ephedrine Hydrochloride, into a 100 ml volumetric flask, dilute with water to volume and mix well, use this solution as test solution. Dissolve an accurately weighed quantity of ephedrine hydrochloride CRS, in water to produce solution containing about 0.2 mg of ephedrine hydrochloride CRS per ml as a reference solution. Measure accurately 1 ml of each of the above two solutions separately into two test tubes, add 1 ml of ninhydrine solution (dissolve 0.4 g of ninhydrine in 2 ml of ethanol, dilute with water to 20 ml, add a 1% solution of sodium carbonate to adjust to pH 7.8-7.9. This solution should be freshly prepared), heat on a water bath for 10 minutes, cool rapidly, add 7 ml of water and mix well. All the solutions to be added above should be measured accurately. Measure the absorbance of the solutions at 570 nm at once (Appendix IV), calculate the content of $C_{10}H_{15}NO \cdot HCl$.

Category As described under Ephedrine Hydrochloride.

Strength 1%

Storage Preserve in tightly closed containers, protected from light.

Pseudoephedrine Hydrochloride

$C_{10}H_{15}NO \cdot HCl$ 201.70

[345-78-8]

Pseudoephedrine Hydrochloride is $S-(R^*, R^*)$ - α -[1-(methylamino) ethyl]-benzenemethanol hydrochloride. It contains not less than 99.0% of $C_{10}H_{15}NO \cdot HCl$, calculated on the dried basis.

Description A white, crystalline powder; odourless; taste, bitter.

Very soluble in water; freely soluble in ethanol; slightly soluble in chloroform.

Melting point 183-186°C (Appendix VI C).

Specific optical rotation +61.0° to +62.5°, in a solution of 50 mg per ml in water (Appendix VI E).

Identification (1) The light absorption of a solution of 0.5 mg per ml in water exhibits maxima at 251 nm, 257 nm and 263 nm (Appendix IV A).

(2) The infrared absorption spectrum (Appendix IV C) is

concordant with the reference spectrum of pseudoephedrine hydrochloride (Appendix XI).

(3) The aqueous solution yields reactions characteristic of chlorides (Appendix III).

Acidity or alkalinity Dissolve 0.2 g in 10 ml of water, add 1 drop of methyl red IS; not more than 0.10 ml of sodium hydroxide (0.02 mol/L) VS or hydrochloric acid (0.02 mol/L) VS is required to change the colour of the solution.

Clarity and colour of solution A solution of 1 g in 20 ml of water is colourless and clear or almost no opalescence; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with phenylsilane bonded silica gel and a mixture of 1.16% ammonium acetate solution-methanol (94:6, adjust with acetic acid to pH of 4.0) as the mobile phase. Detection wavelength is at 257 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of pseudoephedrine and the resolution factor of the two peaks is not less than 2.0. Dissolve a quantity in the mobile phase to produce the solution of the substance being examined containing (1) 2 mg per ml. Measure accurately a quantity of solution (1), dilute with mobile phase to produce the solution (2) 0.01 mg per ml. Dissolve 10 mg of ephedrine hydrochloride CRS with 5 ml of solution (1) in a 100 ml volumetric flask and dilute with the mobile phase to the volume, mix well, as solution (3). Inject 20 μ l of solution (3) into the column, accurately measured, adjust the attenuation so that the two principal peak height in the chromatogram is not less than 50% of the full scale of the chart. Inject separately 20 μ l each of the solution (1) and (2), accurately measured, into the column and record the chromatogram for twice the retention time of the pseudoephedrine peak. The peak area of single impurity is not greater than the principal peak area of the solution (2). The sum of peak areas of all impurities is not greater than twice of the principal peak area of the solution (2) (any peak area less than 10% of the principal peak area obtained with solution (2) can be omitted).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 23 ml of water, add 2 ml of acetate BS (pH 3.5). Carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.002%.

Assay Dissolve about 0.3 g, accurately weighed, in 10 ml of glacial acetic acid on warming, add 5 ml of mercuric acetate TS and 1 drop of crystal violet IS, titrate with perchloric acid (0.1 mol/L) VS until the colour changes to bluish green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 20.17 mg of $C_{10}H_{15}NO \cdot HCl$.

Category β_2 adrenergic receptor stimulant.

Storage Preserve in tightly closed containers, protected from light.

Ergometrine Maleate

$C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$ 441.48

[129-51-1]

Ergometrine Maleate is 6-methylergoline *N*-[(*S*)-2-hydroxy-1-methylethyl]-9,10-didehydro-8 β -carboxamide maleate (1:1) (salt). It contains not less than 98.0% of $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; slightly hygroscopic; deteriorated on exposure to light.

Sparingly soluble in water; slightly soluble in ethanol; insoluble in chloroform or ether.

Specific optical rotation +53° to +56°, in a solution of 10 mg per ml in water (Appendix VI E).

Identification (1) The aqueous solution exhibits a blue fluorescence.

(2) Dissolve about 1 mg in 1 ml of water, add 2 ml of *p*-dimethylaminobenzaldehyde TS; a deep blue colour is produced in 5 minutes.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ergometrine maleate (Appendix XVI).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-methanol-water (25:8:1) as the mobile phase. Apply separately to the plate 10 μ l each of three solutions in ethanol-concentrated ammonia solution (9:1) containing (1) 5 mg per ml, (2) 0.2 mg per ml of the substance being examined and (3) 5 mg per ml of ergometrine maleate CRS. After developing and removal of the plate, dry in air and examine under ultraviolet light (365 nm). The principal spot and the

... y p ... g ...
(1) correspond to those of solution (3) in position; only the principal spot is present in the chromatogram obtained with solution (2).

Loss on drying When dried to constant weight over phosphorous pentoxide, loses not more than 2.0% of its weight (Appendix VIII L).

Assay Dissolve about 60 mg, accurately weighed, in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.05 mol/L) VS until a bluish-green colour is obtained. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.05 mol/L) VS is equivalent to 22.07 mg of $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$.

Category Uterine stimulant.

Storage Preserve in tightly closed containers, stored in a cool place, protected from light.

Preparation Ergometrine Maleate Injection

Ergometrine Maleate Injection

Ergometrine Maleate Injection is a sterile solution of ergometrine maleate in Water for Injection. It contains not less than 90.0% and not more than 110.0% of the labelled amount of ergometrine maleate ($C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$).

Description A clear, colourless or almost colourless liquid with weak blue fluorescence.

Identification To a quantity equivalent to about 0.5 mg of ergometrine maleate, add 2 ml of *p*-dimethylaminobenzaldehyde TS, a deep blue colour is produced in 5 minutes.

pH value 3.0-5.0 (Appendix VI H).

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Reference preparation Dissolve about 15 mg of ergometrine maleate CRS, accurately weighed, in 1% tartaric acid solution in a 250 ml volumetric flask, and dilute to volume, mix well.

Test preparation Transfer an accurately measured quantity equivalent to 1.5 mg of ergometrine maleate to a 25 ml volumetric flask, add water to volume and mix well.

Procedure Transfer separately 1 ml each of the reference preparation and the test preparation accurately measured, to two graduated test tubes with stopper. To each test tube add accurately 1 ml of 1% tartaric acid solution and 4 ml of *p*-dimethylaminobenzaldehyde TS, mix well, allow to stand for 5 minutes and measure the absorbance at 550 nm (Appendix IV A). Calculate the content of $C_{19}H_{23}N_3O_2 \cdot C_4H_4O_4$.

Category As described under Ergometrine Maleate.

Strength (1) 1 ml:0.2 mg (2) 1 ml:0.5 mg

Storage Preserve in well closed containers, protected from light, and store in a cool place.

Ergotamine Tartrate

$(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$ 1313.43

[379-79-3]

Ergotamine Tartrate is [*R*-(*R*^{*}, *R*^{*})]-2'-methyl-5'- α -(phenylmethyl)-12'-hydroxyergotaman-3', 6', 18-trione tartrate, in the crystalline form, it may contain two molecular equivalents of methanol. It contains not less than 97.0% and not more than 103.0% of $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$, calculated on the dried basis.

Description Colourless crystals or a almost white, crystalline powder; odourless. Slightly soluble in ethanol; freely soluble in tartaric acid solution.

Specific optical rotation Carry out the procedure within an hour, protected from light. To 0.30 g add 0.5 g of sodium bicarbonate and 25 ml of water. Shake with ethanol-free chloroform (wash chloroform thoroughly with water) for 7 times, using 10 ml for the first time and 6 ml for each of the succeeding times. Combine the chloroform extracts, filter and make up to 50.0 ml. Measure the optical rotation of this solution (Appendix VI E). Measure accurately 25 ml of this solution, remove chloroform by a current of nitrogen. Dissolve the residue in 20 ml of glacial acetic acid, add 1 drop of crystal violet IS, titrate with perchloric acid (0.05 mol/L) VS until a bluish-green colour is produced. Perform a blank determination and make any necessary correction. Calculate the content of ergotamine in the solution, each ml of perchloric acid (0.05 mol/L) VS is equivalent to 29.08 mg of ergotamine. The specific optical rotation is -154° to -165° , calculated on the basis of ergotamine.

Identification (1) To about 30 mg add 15 mg of tartaric acid, dissolve the mixture in 6 ml of water with shaking. Heat 0.1 ml of the solution in a water bath at 80°C with 1 ml of glacial acetic acid, 1 drop of ferric chloride TS and 1 ml of phosphoric acid, a bluish-violet colour is produced.

(2) To a small quantity on a slide, add 1 drop of concentrated hydrogen peroxide solution, 0.1 ml of dilute acetic acid and 0.2 ml of potassium acetate TS, a colourless crystalline precipitate is observed under a microscope.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ergotamine Tartrate (Appendix XVI).

Acidity Dissolve 20 mg in 8 ml of water, the pH value is 4.0-6.0 (Appendix VI H).

Clarity and colour of solution To 30 mg add 15 mg of tartaric acid, dissolve the mixture, in 6 ml of water with shaking, the solution is clear, any colour produced is not more intensely than that of reference solution Y_3 (Appendix IX A, method 1).

Chloride To 25 mg add 15 mg of tartaric acid, dissolve the mixture in 25 ml of water with shaking. Carry out the limit test for chlorides (Appendix VIII A), any opalescence produced is not more intensely than that of a reference using 0.5 ml of sodium chloride standard solution (0.02%).

Loss on drying When dried to constant weight in vacuum at 95°C , loses not more than 6.0% of its weight (Appendix VIII L), using about 0.2 g.

Assay Reference preparation Dissolve about 10 mg of ergometrine maleate CRS, accurately weighed, in 1% tartaric acid solution in a 200 ml volumetric flask, and dilute to volume, mix well.

Test preparation Weigh accurately 10 mg of the substance being examined, in a 200 ml volumetric flask, dissolve in 1% tartaric acid solution, dilute to volume and mix well.

Procedure Transfer separately 5 ml each of the two preparations, accurately measured, to two stoppered test tubes. To each test tube, add 10 ml of *p*-dimethylamino-benzaldehyde TS, accurately measured, and allow to stand in a dark place for 30 minutes. Measure the absorbance of the two solutions at 550 nm (Appendix IV A). Calculate the content of ergotamine tartrate, each mg of ergometrine maleate is equivalent to 1.488 mg of $(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6$.

Category Antimigrainic agent.

Storage Preserve in tightly closed containers, protected from light and stored in a cold place.

Preparation Ergotamine and Caffeine Tablets

Ergotamine and Caffeine Tablets

Ergotamine and Caffeine Tablets contain not less than 0.85 mg and not more than 1.15 mg of ergotamine tartrate $[(C_{33}H_{35}N_5O_5)_2 \cdot C_4H_6O_6]$, and not less than 90.0 mg and not more than 110.0 mg of anhydrous caffeine ($C_8H_{10}N_4O_2$) in each tablet.

Formula	Ergotamine Tartrate	1 g
	Caffeine, anhydrous	100 g
	To make	1000 tablets

Description Sugar coated or two-layer tablets; the inner layer which contains ergotamine tartrate may be coloured with pigments; the outer layer which contains caffeine is white.

Identification (1) Shake 1 powdered tablet (sugar coating removed) with 5 ml of glacial acetic acid and 5 ml of ethyl acetate, filter. To 1 ml of the filtrate, add slowly 1 ml of sulfuric acid, a violet ring is produced, which disappears on shaking, the solution becomes violet-blue.

(2) To one tenth of a powdered tablet with sugar coating removed in a porcelain dish, add 1 ml of hydrochloric acid and 0.1 g of potassium chlorate, evaporate on a water bath to dryness. Place the inverted dish over another porcelain dish holding a few drops of ammonia TS, the colour of the residue becomes violet which disappears on the addition of a few drops of sodium hydroxide TS.

Other requirements Comply with the general requirements for tablets (Appendix I A), except that the double tablets disintegrate within 30 minutes.

Assay Ergotamine tartrate Weigh accurately and powder 20 tablets with sugar coating removed. Triturate an accurately weighed quantity of the powder equivalent to about 5 mg of ergotamine tartrate with 2 ml of dilute ethanol in a mortar for 5 minutes, transfer with 50 ml of 1% tartaric acid solution in portions to a 100 ml volumetric flask, shake for 30 minutes. Add 1% tartaric acid solution to volume, mix well and filter. Carry out the Assay described under Ergotamine Tartrate, using the filtrate as the test preparation.

Caffeine Measure accurately 20 ml of the above test solution into a 100 ml volumetric flask, add 20 ml of water and 10 ml of dilute sulfuric acid, add accurately 50 ml of iodine (0.1 mol/L) VS, dilute with water to volume and mix well, allow to stand in a dark place for 15 minutes. Filter with a dry filter paper, titrate 50 ml of the successive filtrate, accurately measured, with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end of titration, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of iodine (0.1 mol/L) VS is equivalent to 4.855 mg of $C_8H_{10}N_4O_2$.

Category As described under Ergotamine tartrate.

Storage Preserve in tightly closed containers, protected from light and stored in a cool place.

Erythromycin

$C_{37}H_{67}NO_{13}$ 733.94

[114-07-8]

Erythromycin has a potency of not less than 920 Erythromycin Units per mg, calculated on the anhydrous basis.

Description White or almost white crystals or a powder; odourless; taste, bitter; hygroscopic. Freely soluble in methanol, ethanol or acetone, very slightly soluble in water.

Specific optical rotation -71° to -78° , in a solution of 20 mg per ml in dehydrated ethanol (Appendix VI E).

Identification (1) The retention times of the principal peak of erythromycin in the substance being examined in the chromatogram obtained in the test for Erythromycin A is identical with that of the principal peak of Erythromycin CRS in the chromatogram of the reference solution correspondingly.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of erythromycin (Appendix VI). If the spectra obtained show differences, dissolve a quantity of the substance to be examined and of the reference separately in chloroform, evaporate to dryness on a water bath and dry over phosphorous pentoxide. Carry out the test again, it complies with the requirement disregard any band in the region from 1980 to 2050 cm^{-1} .

Alkalinity Shake 0.1 g with 150 ml of water, pH 8.0-10.5 (Appendix VI H).

Erythromycin A Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of 0.2 mol/L ammonium phosphate solution BS (to 1.15 g of ammonium dihydrogen phosphate add 50 ml of water, adjust the pH value to 6.5 by triethylamine)-0.2 mol/L tetramethylammonium hydroxide solution (to 14.6 ml of 25% tetramethylammonium hydroxide add 100 ml of water, adjust the pH value to 6.5 by phosphoric acid, dilute with water to 200 ml)-acetonitrile-water (5:20:30:45) as the mobile phase. Detection wavelength is 215 nm. Weigh accurately 10 mg of Erythromycin CRS in 10 ml volumetric flasks, add 5 ml of methanol and dilute with phosphate BS (20 ml of phosphate buffer solution pH 7.0, adjust the pH value to 3.5 by phosphoric acid) to volume, allow to stand for 30 minutes. Inject 20 μl of the resulting solution into the column and record the chromatogram. The retention times of the four principal peaks are in this order: erythromycin C, erythromycin A, erythromycin B and erythromycin A enol ether. The resolution factor between the peaks of erythromycin A and erythromycin A enol ether (the retention time is about 3.5 times of erythromycin A) is not less than 14.0. The tailing factor of the peak of

erythromycin A is not more than 2.5.

Procedure Dissolve an accurately weighed quantity of the substance to be examined and of the reference separately in 5 ml of methanol, dilute with a mixture of phosphate buffer solution (pH 7.0)-methanol (15:1) to produce a solution of 4 mg per ml as the test solution and reference solution separately. Inject 20 μl of the two solutions into the column and record the chromatogram. Calculate the content of Erythromycin A with respect to the peak area obtained in the chromatogram by the external method, not less than 88.0% of erythromycin A on the anhydrous basis.

Erythromycin B, C and Related Substance Dissolve an accurately weighed quantity in a mixture of phosphate buffer solution (pH 7.0)-methanol (15:1) to produce a solution of 4 mg per ml as the test solution. Transfer 5 ml of the test solution measure accurately in a 100 ml volumetric flask, dilute with the above solution to volume, mix well as the reference solution. Carry out method as described under Erythromycin A components. Inject 20 μl of the reference solution into the column, adjust the attenuation so that the principal peak height in the chromatogram is 20% of the full scale of the chart. Inject 20 μl of the test solution and the reference solution separately into the column and record the chromatogram for 4 times the retention time of the principal peak. Multiply the peak areas of erythromycin B and erythromycin C by the correction factor (the correction factor of erythromycin A, erythromycin B and erythromycin C is 1.0, 0.7 and 1.0 respectively), the peak areas of erythromycin B and erythromycin C are not greater than the area of the principal peak in the chromatogram obtained with the reference solution respectively (5%). The multiplied peak area of erythromycin A enol ether (the correction factor of erythromycin A enol ether is 0.09) is not greater than 3/5 times the area of the principal peak in the chromatogram obtained with the reference solution (3%); each peak area is not greater than 3/5 times the area of the principal peak in the chromatogram obtained with the reference solution (3%); the sum of the areas of all the other secondary peaks are not greater than the area of the principal peak in the chromatogram obtained with the reference solution (5%) (disregard any peaks not more than 0.01 times of the area of the principal peak in the chromatogram obtained with the test solution).

Residue on ignition Not more than 0.2% (Appendix VIII N).

Thiocyanate Dissolve about 0.1 g, accurately weighed, in 20 ml of methanol in a 50 ml amber-coloured volumetric flask, add 1 ml of ferric chloride TS, dilute with methanol to volume, mix well as the test solution. Dissolve two portions of 0.1 g of potassium thiocyanate, previously dried at 105°C for 1 hour, accurately weighed, in two 50 ml volumetric flask separately, add 20 ml of methanol, dilute with methanol to volume, mix well, transfer separately 5 ml to another 50 ml volumetric flasks, dilute with methanol to volume, mix well, transfer separately 5 ml to another 50 ml amber-coloured volumetric flasks, add 1 ml of ferric chloride TS, dilute with methanol to volume, mix well, as the reference solution. Transfer 1 ml of ferric chloride TS to 50 ml amber-coloured volumetric flasks, dilute with methanol to volume, mix well as the blank solution. Measure the absorbance at 492 nm (Appendix IV A) (the test solution, two reference solutions and the blank solution must be determined in 30 minutes). The test is not valid unless the ratio of the mass and absorbances of the two reference solutions is not less than 0.985 and not more than 1.015. The content of thiocyanate in erythromycin is not more than 0.3%. Relative molecular mass of the thiocyanate moiety is 58.08, relative molecular mass of potassium thiocyanate

is 97.18.

Water Not more than 6.0% (Appendix VIII M, method 1). Dissolve 0.2 g in 10% imidazole solution in anhydrous methanol.

Assay Dissolve an accurately weighed quantity in a few ml of ethanol, dilute with sterile water to produce a solution of about 1000 Units per ml. Carry out the microbiological assay of antibiotics (Appendix XI A). The fiducial limit is not more than 7%. 1000 Erythromycin Units are equivalent to 1 mg of $C_{37}H_{67}NO_{13}$.

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Erythromycin Enteric-coated Tablets
(2) Erythromycin Eye Ointment
(3) Erythromycin Ointment

Erythromycin Enteric-coated Tablets

Erythromycin Enteric-coated Tablets contain not less than 90.0% and not more than 110.0% of the labelled potency of erythromycin ($C_{37}H_{67}NO_{13}$).

Description Enteric-coated tablets with white or almost white cores.

Identification (1) The retention time of the peak of erythromycin A in the substance being examined in the chromatogram obtained in the test for Erythromycin A is identical with that of the peak of Erythromycin CRS in the chromatogram of the reference solution.

(2) Carry out the method for thin-layer chromatography (Appendix V B) using silica gel G as the coating substance and a mixture of chloroform-methanol (85:15) as mobile phase. Apply separately to the plate 10 μ l each of two solutions in methanol containing (1) 2.5 mg per ml of the substance being examined and (2) 2.5 mg per ml of erythromycin CRS respectively. After developing and removal of the plate, dry in air, spray with ethanol-p-methoxybenzaldehyde-sulfuric acid (90:5:5), heat at 100°C for several minutes until the black to purple in colour of the spots are developed. The colour and position of the two principal spots in the chromatogram obtained with the test solution correspond to the principal spot obtained with reference solutions.

(1) or (2) may be used alternative.

Dissolution Carry out the method for dissolution test (Appendix X D method 2 (1) and X C, method 1) using hydrochloric acid solution (9 \rightarrow 1000) as the dissolution medium initially, adjust the rotational speed to 100 rpm. Any enteric-coated tablets shows no cracking, disintegrating or softening after exactly 2 hours. Then using phosphate BS (pH 6.8) as the solvent, withdraw 10 ml of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate, accurately measured, with phosphate BS (pH 6.8) to produce a solution containing about 55 μ g of erythromycin per ml. Triturate 10 tablets a quantity of erythromycin (about one tablets average weigh) Dissolve in phosphate BS (pH 6.8) to produce a solution containing about 55 μ g of erythromycin per ml. Add 5 ml of sulfuric acid solution (75 \rightarrow 100) to 5 ml of each of above two solution, mix well, allow them to stand for 30-40 minutes. Measure the absorbance of the resulting solution at 482 nm (Appendix IV A). Calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each tablet. Not less than 85% of the labelled amount is dissolved.

Erythromycin A Weigh and powder 20 tablets with enteric sugar coating removed. Dissolve a quantity of the powdered tablets equivalent to about 0.1 g of erythromycin in 5 ml of methanol, dilute with a mixture of phosphate buffer solution (pH 7.0)-methanol (15:1) to produce a solution of 4 mg per ml as the test solution. Carry out the method as described under Erythromycin. Calculate the content of Erythromycin A on the labeled amount, not less than 83.5% of erythromycin A is found.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Triturate 4 tablets with ethanol (using 25 ml of ethanol for about 0.25 g of Erythromycin) in several portions to dissolve erythromycin. Dilute with water to produce a solution of about 1000 Units per ml and mix well. Allow it to stand, measure accurately a quantity of the supernatant liquid and carry out the Assay described under Erythromycin.

Category As described under Erythromycin.

Strength (1) 0.125 g (125000 Units)
(2) 0.25 g (250000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Erythromycin Eye Ointment

Erythromycin Eye Ointment contains not less than 90.0% and not more than 110.0% of the labelled potency of erythromycin ($C_{37}H_{67}NO_{13}$).

Description A white to yellow ointment.

Identification To about 0.5 g add 5 ml of sulfuric acid solution (0.1 mol/L), heat and stir on a water bath to dissolve erythromycin. Allow it to cool. To the aqueous layer add 2 ml of sulfuric acid, mix slowly, a brown colour is produced.

Other requirements Complies with the general requirements for Eye preparations (Appendix I G).

Assay Dissolve an accurately weighed quantity equivalent to about 10 mg of erythromycin, in 20 ml of petroleum ether in a separator, extract with 4 quantities each of 25 ml of phosphate BS (pH 7.8-8.0) and dilute the combined extracts to 100 ml with phosphate BS (pH 7.8-8.0). Carry out the Assay described under Erythromycin.

Category As described under Erythromycin.

Strength 0.5%

Storage Preserve in well closed containers, stored in a cool and dry place.

Erythromycin Ointment

Erythromycin ointment contains not less than 90.0% and not more than 110.0% of the labelled amount of erythromycin ($C_{37}H_{67}NO_{13}$).

Description A white to yellow ointment.

Identification To about 0.5 g add 5 ml of sulfuric acid solution (0.1 mol/L), heat and stir well in a water bath. Allow it to cool, to the water layer add 2 ml of sulfuric acid, mix gently, a brown colour is produced.

Other requirements Complies with the general requirements for ointments (Appendix I F).

Assay Dissolve as completely as possible an accurately weighed quantity equivalent to about 10 mg of erythromycin in 20 ml of petroleum ether in a separator, extract with 4 quantities of 25 ml each of phosphate BS (pH 7.8-8.0) and dilute the combined extracts to 100 ml with phosphate BS (pH 7.8-8.0), carry out the assay described under Erythromycin.

Category As described under Erythromycin.

Strength 1%

Storage Preserve in well closed containers, stored in a cool and dry place.

Erythromycin Estolate

$C_{40}H_{71}NO_{14} \cdot C_{12}H_{26}O_4S$ 1056.40 [3521-62-8]

Erythromycin Estolate is erythromycin propionate dodecyl sulfate. It has a potency of not less than 610 Erythromycin Units per mg, calculated on the anhydrous basis.

Description A white crystalline powder; odourless; tasteless or almost tasteless. Freely soluble in ethanol or chloroform, practically insoluble in water.

Melting range 132-138°C, regulating the rise of temperature at a rate of 2.5-3.0°C per minute after dried over phosphorous pentoxide (Appendix VI C).

Identification (1) Dissolve 5 mg in 2 ml of acetone and add 2 ml of hydrochloric acid; an orange-yellow colour is produced then gradually changes to purplish-red. Add 2 ml of chloroform and shake, the chloroform layer becomes blue colour.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of erythromycin estolate (Appendix XVI).

Acidity or alkalinity A supernatant liquid of 40 mg per ml in water, pH 5.0-7.2 (Appendix VI H)

Free erythromycin Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as coating substance and a mixture of methanol-chloroform (85:15) as the mobile phase. Elute the plate with methanol and allow it to dry in air before use. Apply separately to the plate 1 μ l each of two solutions in methanol containing (1) 10.0 mg per ml of the substance being examined and (2) 0.3 mg per ml of erythromycin RS. After developing and removal of the plate, dry in air and spray with a solution containing 0.18 ml of 10% xanthidrol in methanol and 100 ml of a mixture of hydrochloric acid-glacial acetic acid (92.5:7.5), heat at 105°C for several minutes until the purple spots develop. The erythromycin spot in the chromatogram obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Water Not more than 4.0% (Appendix VIII M, method 1 A), using a quantity in a 10% imidazole solution in anhydrous methanol.

Assay Dissolve an accurately weighed quantity equivalent to about 50 mg of erythromycin in 50 ml ethanol in a 100 ml volumetric flask and dilute to volume with phosphate BS (pH 7.8). Mix well and warm the solution on water bath at 37°C for 6 hours to hydrolyze the solution completely. Dissolve about 25 mg of erythromycin RS, accurately weighed, in 25 ml ethanol in a 50 ml volumetric flask and dilute to volume with phosphate BS (pH 7.8) and mix well. Carry out the Microbiological Assay of Antibiotics described under Erythromycin (Appendix XI A).

Category macrolide antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Erythromycin Estolate Capsules
(2) Erythromycin Estolate Granules
(3) Erythromycin Estolate Tablets

Erythromycin Estolate Capsules

Erythromycin Estolate Capsules contain not less than 90.0% and not more than 110.0% of the average amount of erythromycin ($C_{37}H_{67}NO_{13}$).

Identification Triturate a quantity of the powdered contents equivalent to 0.1 g of erythromycin estolate with 5 ml of chloroform, filter and evaporate the filtrate to dryness. The residue complies with the tests for Identification described under Erythromycin Estolate.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.2% sodium dodecylsulfate solution in hydrochloric acid solution (9 \rightarrow 1000) as the dissolution medium, adjust the rotational speed to 75 rpm [50 mg, carry out the dissolution test (Appendix X C, method 3), using 250 ml of 0.2% sodium dodecylsulfate solution in hydrochloric acid solution (9 \rightarrow 1000) as the solvent, adjust the rotational speed to 50 rpm]. Withdraw the solution after exactly 45 minutes and filter, as the test solution. Dissolve a quantity, equivalent to about the average weight of one capsule obtained in the test for weight variation of contents, in ethanol (dissolve 25 mg of erythromycin in 5 ml ethanol according to the labelled amount) and dilute to produce a solution of 138 μ g of erythromycin per ml with a 0.2% solution of sodium dodecylsulfate in hydrochloric acid solution (9 \rightarrow 1000) according to the labelled amount, and filter, the successive filtrate as the reference solution. Measure accurately 2 ml each of the two solutions separately, add 5 ml of sulfuric acid solution (75 \rightarrow 100), mix well, allow it to stand for 30 minutes and cool. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each capsule. Not less than 70% of the labelled amount is dissolved.

Water Not more than 5.0% (Appendix VIII A, method 1A), using about 0.2 g of the contents of the capsules in a 10% imidazole solution in anhydrous methanol.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity equivalent to 0.125 g of erythromycin obtained in the test for weight variation of contents in 125 ml ethanol in a 250 ml volumetric flask and dilute to volume with phosphate BS (pH 7.8).

Mix well and warm the solution on water bath at 37°C for 6 hours to hydrolyze the solution completely. Measure accurately a quantity of the supernatant and carry out the Assay described under Erythromycin Estolate.

Category As described under Erythromycin Estolate.

Strength Calculated as erythromycin
(1) 50 mg (50000 Units)
(2) 125 mg (125000 Units)

Storage Preserve in tightly closed containers, protected from light.

Erythromycin Estolate Granules

Erythromycin Estolate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of erythromycin ($C_{37}H_{67}NO_{13}$).

Description Suspensible granules, odour fragrant; taste, sweet.

Identification Shake a quantity of the powdered granules equivalent to about 20 mg of erythromycin estolate in a centrifuge tube with a quantity of water to produce a homogeneous suspension, centrifuge and discard the supernatant and wash the precipitate with water for 3 times. The precipitate dried in a desiccator over phosphorous pentoxide complies with test (1) for Identification described under Erythromycin Estolate.

Acidity or Alkalinity A suspension of 3.3 g in 10 ml of water, pH 5.0-7.0 (Appendix VI H).

Water Not more than 2.0% (Appendix VIII A, method 1A), using 0.2 g in a 10% imidazole solution in anhydrous methanol.

Other requirements Comply with the general requirements for Granules (Appendix I N).

Assay Dissolve an accurately weighed quantity equivalent to 0.125 g of erythromycin estolate in the test or weight variation of contents in 125 ml ethanol in a 250 ml volumetric flask and dilute to volume with phosphate BS (pH 7.8). Mix well and warm the solution on water bath at 37°C for 6 hours to hydrolyze the solution completely. Measure accurately a quantity of the supernatant and carry out the Assay described under Erythromycin Estolate.

Category As described under Erythromycin Estolate.

Strength (1) 75 mg (75000 Units)
(2) 250 mg (25000 Units)
(calculated as erythromycin)

Storage Preserve in tightly closed containers, protected from light.

Erythromycin Estolate Tablets

Erythromycin Estolate Tablets contain not less than 90.0% and not more than 110.0% of the labelled potency of erythromycin ($C_{37}H_{67}NO_{13}$).

Description White tablets.

Identification To 1 powdered tablet add 5 ml of chloroform, triturate and filter. The residue obtained after evaporation of the filtrate complies with the tests for Identification described under Erythromycin Estolate.

Dissolution Carry out the dissolution test (Appendix X C, method 2), using 900 ml of 0.2% sodium dodecylsulfate solution in hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed to 75 rpm. Withdraw the solution after exactly 45 minutes and filter, as the test solution. Dissolve a quantity of 10 powdered tablets equivalent to about the average weight of one tablet in ethanol (dissolve 25 mg of erythromycin in 5 ml ethanol according to the labelled amount). Dilute to produce a solution of 138 µg of erythromycin per ml with a 0.2% sodium dodecylsulfate solution in hydrochloric acid solution (9→1000) according to the labelled amount and filter, the successive filtrate as the reference solution. Measure accurately 2 ml each of the two solutions separately, add 5 ml of sulfuric acid solution (75→100), mix well, allow it to stand for 30 minutes and cool. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A), calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each tablet. Not less than 70% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh and powder 10 tablets. Dissolve an accurately weighed quantity equivalent to about 0.125 g erythromycin in 125 ml ethanol and dilute to volume in a 250 ml volumetric flask with phosphate BS (pH 7.8). Mix well and warm the solution on water bath at 37°C for 6 hours to hydrolyze the solution completely. Measure accurately a quantity of the supernatant liquid and carry out the Assay described under Erythromycin Estolate.

Category As described under Erythromycin Estolate.

Strength 0.125 g (125000 Units) Calculated as erythromycin

Storage Preserve in tightly closed containers, protected from light.

Erythromycin Ethylsuccinate

$C_{43}H_{75}NO_{16}$ 862.07

[41342-53-4]

Erythromycin Ethylsuccinate is ethylsuccinate of erythromycin. It contains not less than 765 erythromycin Units per mg, calculated on the anhydrous basis.

Description A white or crystalline powder; odourless; tasteless. Freely soluble in dehydrated ethanol, acetone or chloroform; sparingly soluble in ether; practically insoluble in water.

Identification (1) To about 5 mg add 3-5 drops each of a saturated methanolic solution of hydroxylamine hydrochloride and sodium hydroxide, heat on a water bath until bubbles are evolved, cool, acidify with hydrochloric acid solution (4.5→100), add 0.5 ml of ferric chloride TS; a reddish violet colour is produced.

(2) Carry out the method described under Related substances, applying separately to the plate 10 µl of each of two solutions in acetone containing (1) 4 mg of the

substance being examined per ml and (2) 4 mg of erythromycin ethylsuccinate (RS) per ml. The colour and position of the principal spot in the chromatogram obtained with solution (1) correspond to the principal spot obtained with solution (2).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of erythromycin ethylsuccinate (Appendix XVI).

Acidity or alkalinity A supernatant liquid of 10 mg per ml in water, pH 6.0-8.5 (Appendix VI H).

Related substances Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of chloroform-ethanol-15% ammonium acetate solution (85:15:1), pH 7.0 adjust to with ammonia solution before use, as the mobile phase. Apply separately to the plate 10 μ l of each of two solutions in acetone containing (1) 4.0 mg per ml of the substance being examined and (2) 0.2 mg per ml of erythromycin RS. After developing and removal of the plate, dry in air, spray with a solution containing 0.5 ml of anisaldehyde, 10 ml of glacial acetic acid, 85 ml of methanol and 5 ml of sulfuric acid, heat at 110°C until the spots develop. Any spot in the chromatogram other than the principal spot obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Water Dissolve a quantity in 100 g/L imidazole solution in anhydrous methanol, carry out the method for determination of water (Appendix VIII M, method 1A); not more than 3.0%.

Residue on ignition Not more than 0.5% (Appendix VIII N).

Assay Dissolve an accurately weighed quantity in ethanol (using 4 ml of ethanol for 10 mg of Erythromycin Ethylsuccinate), dilute with phosphate BS (pH 7.8) to produce a solution of about 500 Units per ml, to stand for 16 hours in air or to stand at 40°C for 6 hours. Dissolve about 25 mg of Erythromycin RS, accurately weighed, add 12.5 ml of ethanol, dilute with phosphate BS (pH 7.8) to produce a solution of about 500 Units per ml. Carry out the microbiological assay of antibiotics described under Erythromycin (Appendix XI A). 1000 Erythromycin Units are equivalent to 1 mg $C_{37}H_{67}NO_{13}$.

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, stored in a dry place.

Preparation (1) Erythromycin Ethylsuccinate Capsules
(2) Erythromycin Ethylsuccinate Granules
(3) Erythromycin Ethylsuccinate Dispersible Tablets
(4) Erythromycin Ethylsuccinate Tablets

Erythromycin Ethylsuccinate Capsules

Erythromycin Ethylsuccinate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of Erythromycin Ethylsuccinate, calculated with reference to Erythromycin ($C_{37}H_{67}NO_{13}$).

Description Capsules containing white granules or powder.

Identification (1) Comply with test (1) for Identification described under Erythromycin Ethylsuccinate, using a quantity of the contents of the capsules equivalent to 5 mg of

Erythromycin Ethylsuccinate.

(2) Dissolve a quantity of the contents of the capsules in acetone to produce a solution containing 4 mg of Erythromycin Ethylsuccinate per ml and filter, using the filtrate as a test solution. The test solution complies with test (2) for Identification described under Erythromycin Ethylsuccinate.

Dissolution Carry out the dissolution test (Appendix X C, method 2) using 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter, use the successive filtrate as a test solution. Triturate the contents of 10 capsules, dissolve an accurately weighed quantity equivalent to about the average weight of one capsule in ethanol (using 5 ml of ethanol for 10 mg of Erythromycin), dilute with 0.1 mol/L hydrochloric acid solution to produce a solution containing 0.1 mg of Erythromycin per ml, filter, use the successive filtrate as a reference solution. Measure accurately 5 ml of the above two solutions in two 25 ml volume flasks, respectively. To each add 5 ml of 0.1 mol/L hydrochloride solution and 10 ml of sulfuric acid solution (75→100), mix well and allow to stand for 30 minutes, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A). Calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each capsule. Not less than 80% of the labelled amount is dissolved.

Water Dissolve a quantity in 100 g/L imidazole solution in anhydrous methanol, carry out the method for determination of water (Appendix VIII M, method 1 A); not more than 3.0%.

Other requirements comply with the general requirements for capsules (Appendix I E).

Assay Weigh accurately and powder 10 tablets. Triturate an accurately weighed quantity of the powder equivalent to about 0.1 g of Erythromycin with 50 ml of ethanol in portions to dissolve Erythromycin Ethylsuccinate, dilute with phosphate BS (pH 7.8) to produce a solution of about 500 Units per ml, mix well and allow to stand for 16 hour in air or to stand at 40°C for 6 hours. Measure accurately a quantity of the supernatant liquid and carry out the microbiological assay of antibiotics described under Erythromycin (Appendix XI A).

Category As described under Erythromycin Ethylsuccinate.

Strength 0.1 g (100000 Units) (Calculated as $C_{37}H_{67}NO_{13}$)

Storage Preserve in tightly closed containers, stored in a dry place.

Erythromycin Ethylsuccinate Dispersible Tablets

Erythromycin Ethylsuccinate Dispersible Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Erythromycin Ethylsuccinate, calculated with reference to Erythromycin ($C_{37}H_{67}NO_{13}$).

Description White tablets.

Identification (1) Comply with test (1) for Identification described under Erythromycin Ethylsuccinate, using a quantity of powdered tablets equivalent to 5 mg of Erythromycin Ethylsuccinate.

(2) Dissolve a quantity of powdered tablets in acetone to produce a solution containing 4 mg of Erythromycin Ethylsuccinate per ml and filter, use the successive filtrate as a test solution. The test solution complies with test (2) for Identification described under Erythromycin Ethylsuccinate.

Dissolution Carry out the dissolution test (Appendix X C, method 2) 0.1 mol/L using hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 15 minutes and filter, use the successive filtrate as a test solution. Triturate 10 tablets and dissolve an accurately weighed quantity equivalent to about the average weight of one tablet in ethanol (using 5 ml of ethanol for 10 mg of Erythromycin), dilute with 0.1 mol/L hydrochloric acid solution to produce a solution containing 0.1 mg of Erythromycin per ml, filter, use the filtrate as a reference solution. Measure accurately 5 ml of the above two solutions in two 25 ml volume flasks, respectively. To each add 5 ml of 0.1 mol/L hydrochloride solution and 10 ml of sulfuric acid solution (75→100), mix well and allow to stand for 30 minutes, dilute the filtrate with hydrochloric acid solution (0.1 mol/L) to volume, mix well. Measure the absorbances of the resulting solutions at 482 nm (Appendix IV A). Calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each tablets. Not less than 80% of the labelled amount is dissolved.

Other requirements comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Triturate an accurately weighed quantity of the powder equivalent to about 0.1 g of Erythromycin with 50 ml of ethanol in portions to dissolve Erythromycin Ethylsuccinate, dilute with phosphate BS (pH 7.8) to produce a solution of about 500 Units per ml, mix well and allow to stand for 16 hour in air or to stand at 40°C for 6 hour. Measure accurately a quantity of the supernatant liquid and carry out the microbiological assay of antibiotics described under Erythromycin (Appendix XI A).

Category As described under Erythromycin Ethylsuccinate.

Strength Calculated as $C_{37}H_{67}NO_{13}$
 (1) 0.1 g (100000 Units)
 (2) 0.125 g (125000 Units)

Storage Preserve in tightly closed containers, stored in a dry place.

Erythromycin Ethylsuccinate Granules

Erythromycin Ethylsuccinate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of Erythromycin Ethylsuccinate, calculated with reference to Erythromycin ($C_{37}H_{67}NO_{13}$).

Description Soluble granules; taste sweet, aromatic.

Identification (1) A quantity of powdered granules equivalent to 5 mg of Erythromycin Ethylsuccinate complies with test (1) for Identification described under Erythromycin Ethylsuccinate

(2) Dissolve a quantity of powered granules in acetone to produce a solution containing 4 mg of Erythromycin Ethylsuccinate per ml and filter, use the successive filtrate as a test solution. The test solution complies with test (2) for Identification described under Erythromycin Ethylsuccinate.

Acidity or alkalinity To a quantity of the substance being examined add water to produce a suspension of 40 mg per ml, the pH value of the supernatant liquid is 7.0-9.0

(Appendix VI H).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Triturate 5 containers of powdered granules equivalent to about 50 mg of Erythromycin with 25 ml of ethanol in portions to dissolve Erythromycin Ethylsuccinate, dilute with phosphate BS (pH 7.8) to produce a solution of about 500 Units per ml, mix well and allow to stand for 16 hours in air or to stand at 40°C for 6 hours. Measure accurately a quantity of the supernatant liquid and carry out the Microbiological Assay of Antibiotic (Appendix XI A).

Category As described under Erythromycin Ethylsuccinate.

Strength Calculated as $C_{37}H_{67}NO_{13}$
 (1) 0.05 g (50000 Units)
 (2) 0.1 g (100000 Units)
 (3) 0.125 g (125000 Units)
 (4) 0.25 g (250000 Units)

Storage Preserved in tightly closed containers, stored in a dry place and protected from light.

Erythromycin Ethylsuccinate Tablets

Erythromycin Ethylsuccinate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of Erythromycin Ethylsuccinate, calculated with reference to Erythromycin ($C_{37}H_{67}NO_{13}$).

Description White tablets.

Identification (1) Comply with test (1) for Identification described under Erythromycin Ethylsuccinate, using a quantity of powdered tablets equivalent to 5 mg of erythromycin ethylsuccinate.

(2) Dissolve a quantity of powered granules in acetone to produce a solution containing 4 mg of Erythromycin Ethylsuccinate per ml and filter, use the successive filtrate as a test solution. The test solution complies with test (2) for Identification described under Erythromycin Ethylsuccinate.

Dissolution Carry out the dissolution test (Appendix X C, method 2) using 0.1 mol/L hydrochloric acid solution as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 30 minutes and filter. Dilute the successive filtrate with 0.1 mol/L hydrochloric acid solution to produce a solution containing 0.1 mg of Erythromycin per ml as a test solution. Triturate 10 tablets and dissolve an accurately weighed quantity equivalent to about the average weight of one tablet in ethanol (using 5 ml of ethanol for 10 mg of Erythromycin), dilute with 0.1 mol/L hydrochloric acid solution to produce a solution containing 0.1 mg of Erythromycin per ml, filter, use the successive filtrate as a reference solution. Measure accurately 5 ml of the above two solutions in two 25 ml volume flasks, respectively. To each flask add 5 ml of 0.1 mol/L hydrochloride solution and 10 ml of sulfuric acid solution (75→100), mix well and allow to stand for 30 minutes, dilute with 0.1 mol/L hydrochloric acid solution to volume, mix well. Measure the absorbance of the resulting solutions at 482 nm (Appendix IV A). Calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each tablet. Not less than 80% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 10 tablets. Triturate

an accurately weighed quantity of the powder equivalent to about 0.1 g of erythromycin with 40 ml of ethanol in portions to dissolve erythromycin ethylsuccinate, dilute with phosphate BS (pH 7.8) to produce a solution of about 500 Units per ml, mix well and allow to stand for 16 hours in air or to stand at 40°C for 6 hours. Measure accurately a quantity of the supernatant liquid and carry out the Microbiological Assay of Antibiotics described under erythromycin (Appendix XI A).

Category As described under Erythromycin Ethylsuccinate.

Strength Calculated as $C_{37}H_{67}NO_{13}$
 (1) 0.1 g (100000 Units)
 (2) 0.125 g (125000 Units)
 (3) 0.25 g (250000 Units).

Storage Preserve in tightly closed containers, stored in a dry place.

Erythromycin Lactobionate

$C_{37}H_{67}NO_{13} \cdot C_{12}H_{22}O_{12}$ 1092.24 [3847-29-8]

Erythromycin Lactobionate is erythromycin lactobionate (1:1). It has a potency of not less than 610 Erythromycin Units per mg, calculated on the dried basis.

Description White or almost white crystals or a crystalline powder; odourless; taste, bitter. Freely soluble in water or ethanol, slightly soluble in acetone or chloroform, insoluble in ether.

Identification The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of erythromycin lactobionate (Appendix XVI). If the absorption band at $1750-1680\text{ cm}^{-1}$ is not concordant with the reference spectrum, dissolve a quantity in dehydrated ethanol, evaporate to dryness on a water bath and dry in a vacuum desiccator. Carry out the test again, it complies with the requirement.

Acidity or alkalinity Dissolve 0.85 g in 10 ml of water, pH 6.0-7.5 (Appendix VI H).

Clarity and colour of solution Dissolve 5 portions each of 0.85 g in 10 ml of water respectively, the solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1).

Related substances Carry out the method for thin-layer chromatography (Appendix V B) using silica gel G and kieselguhr G (mix 1 g each of silica gel G and kieselguhr G, triturate with 8 ml of water in two portions) as the coating substance and ethyl acetate saturated with concentrated ammonia solution (shake 10 volumes of ethyl acetate with 1 volume of concentrated ammonia solution in a separator, allow it to stand, decant the ammonia saturated ethyl acetate

layer into chromatographic chamber, let the vapour to saturate the chamber for at least 4 hours) as mobile phase. Spread the coating substance over a 10 cm × 20 cm glass plate, dry in air and activate at 105°C for 1-2 hours. Apply separately to the plate 5 μl each of two solutions in ethanol containing (1) 20 mg of the substance being examined (Calculated with reference to erythromycin) per ml and (2) 1.5 mg of the erythromycin RS per ml. After developing and removal of the plate, dry in air and spray with a solution containing 1 g of cerium sulfate and 2.5 g of sodium molybdate in 100 ml of 10% sulfuric acid solution, heat at 105°C for several minutes until blue spots are developed. Any spot, other than the principal spot (the spot of lactobionic acid remaining in the origin) in the chromatogram, obtained with solution (1) is not more intense than the principal spot obtained with solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 4.0% of its weight (Appendix VIII L).

Bacterial endotoxin Carry out the test for bacterial endotoxin (Appendix XI E); not more than 1 EU each 1000 units of erythromycin ethylsuccinate.

Sterility Complies with the test for sterility (Appendix XI), g portions each containing the maximum dose of the preparation being examined, and to each portion add sterile water to produce a solution of 30000 Units per ml.

Assay Dissolve an accurately weighed quantity in sterile water to produce a solution of 1000 Units per ml and carry out the Microbiological Assay of Antibiotics described under Erythromycin. The fiducial limit is not more than 7%.

Category Macrolide antibiotic.

Storage Preserve in hermetically sealed containers, stored in a dry place.

Preparation Erythromycin Lactobionate for Injection

Erythromycin Lactobionate for Injection

Erythromycin Lactobionate for Injection is a sterile crystal or powder, or sterile lyophilized substance. It has a potency of not less than 610 Erythromycin Units per mg, calculated on the dried basis; it contains not less than 93.0% and not more than 107.0% of the labelled potency of erythromycin ($C_{37}H_{67}NO_{13}$), calculated on the basis of the average weight of contents.

Description White or almost white crystals or a powder, or loose masses.

Identification Complies with the tests for Identification described under Erythromycin Lactobionate.

Clarity and colour of solution To each of 5 containers, add water to produce solutions containing 50 mg of erythromycin per ml. The solutions are clear and colourless; any opalescence produced is not more pronounced than that of reference suspension I (Appendix IX B); any colour produced is not more intense than that of reference solution Y₁ (Appendix IX A, method 1).

Related substances Complies with the test for Related substances described under Erythromycin Lactobionate.

Loss on drying When dried to constant weight at 105°C,

loses not more than 5.0% of its weight (Appendix VIII L).

Acidity or alkalinity, Bacterial endotoxin, Sterility Complies with the corresponding requirement described under Erythromycin Lactobionate.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the Assay described under Erythromycin Lactobionate, using the mixed contents obtained in the test for weight variation of contents.

Category As described under Erythromycin Lactobionate.

Strength (1) 0.25 g (250000 Units)
(2) 0.3 g (300000 Units)

Storage Preserve in well closed containers, stored in a dry place.

Erythromycin Stearate

$C_{37}H_{67}NO_{13} \cdot C_{18}H_{36}O_2$ 1018.42

[643-22-1]

Erythromycin Stearate is a mixture of the stearic acid salt of erythromycin and excess amount of stearic acid. It has a potency of not less than 550 Erythromycin Units per mg, calculated on the anhydrous basis.

Description A white or almost white crystalline powder; odourless; taste, bitter.

Soluble in methanol, ethanol or chloroform; slightly soluble in acetone; practically insoluble in water.

Identification (1) Dissolve 3 mg in 2 ml of acetone and add 2 ml of hydrochloric acid; an orange yellow colour is produced which gradually changes to purplish-red. Add 2 ml of chloroform and shake, the chloroform layer becomes blue.

(2) To 0.1 g add 5 ml of hydrochloric acid solution (2 mol/L) and 10 ml of water, gently heat to boiling when oily pearls float on the surface, allow it to cool, to the fatty layer add 3 ml of sodium hydroxide solution (0.1 mol/L), heat to boil, allow it to cool, a white gel is formed. Add 10 ml of boiling water to dissolve the gel (heat if necessary), shake to form foams. To 1 ml of the solution add 3-4 drops of a 10% solution of calcium chloride, while heating and shaking a granular precipitate is produced, which is insoluble in hydrochloric acid.

(3) The infra red absorption spectrum (Appendix IV C) is concordant with the reference spectrum of Erythromycin Stearate (Appendix XVI).

Free stearic acid Dissolve 0.4 g, accurately weighed, in 50 ml of ethanol previously neutralized to phenolphthalein IS with sodium hydroxide VS (0.1 mol/L), add 1-2 drops of phenolphthalein IS and titrate with sodium hydroxide VS (0.1 mol/L) until the colour changes to pink. Calculate the volume (ml) of sodium hydroxide VS (0.1 mol/L) required for each g of substance being examined and subtract

the volume (ml) of perchloric acid VS (0.1 mol/L) required for each g of the substance being examined in the test for Erythromycin stearate, each ml of the difference is equivalent to 28.45 mg of $C_{18}H_{36}O_2$. The content of stearic acid is not more than 14.0%, calculated on the anhydrous basis.

Erythromycin stearate Dissolve 0.5 g, accurately weighed in 30 ml of chloroform, shake thoroughly, filter, extract the residue with 3 portions each of 25 ml of chloroform, filter the extracts, wash the filter paper with chloroform, evaporate the combined filtrates and washings on a water bath to about 30 ml, add 50 ml of anhydrous glacial acetic acid previously neutralized with perchloric acid VS (0.1 mol/L), using crystal violet IS as indicator, titrate with perchloric acid VS (0.1 mol/L) until the colour changes to bluish-green. Each ml of perchloric acid VS (0.1 mol/L) is equivalent to 101.8 mg of $C_{37}H_{67}NO_{13} \cdot C_{18}H_{36}O_2$. The content of erythromycin stearate is not less than 77.0%, calculated on the anhydrous basis.

Sodium stearate Carry out the method for residue on ignition (Appendix VIII N), using 2.0 g. Each g of the residue is equivalent to 4.317 g of $C_{18}H_{35}NaO_2$; not more than 6.0%.

Free stearic acid, Erythromycin stearate and sodium stearate Not less than 98.0% and not more than 103.0%, calculated by adding together the percentage of free stearic acid, erythromycin stearate and sodium stearate determined as described above, and on the anhydrous basis.

Related substances Carry out the method for thin layer chromatography (Appendix V B), using silica gel G and K_2CO_3 -silica gel G (1:1) as the coating substance and a freshly prepared ethyl acetate solution saturated with concentrated ammonia solution [shake 10 volume of ethyl acetate with 1 volume of concentrated ammonia solution in a separator, allow it to stand, and transfer the ethyl acetate layer into a chromatographic chamber for not less than 4 hours.] as the mobile phase. Spread the coating substance over a 10 cm \times 20 cm glass plate, dry it at room temperature and activate at 105°C for 1-2 hours. Apply separately to the plate 5 μ l each of two solutions in ethanol containing (1) 20 mg of the substance being examined per ml, calculated as erythromycin, and (2) 1.5 mg of the erythromycin RS per ml. After developing and removal of the plate, dry it in air and spray with a solution (containing 1 g of cerium sulfate and 2.5 g of sodium molybdate, in 100 ml of 10% sulfuric acid), heat at 105°C for several minutes until blue spots are developed. Any spot, other than the principal spot in the chromatogram obtained with the solution (1) is not more intense than the principal spot obtained with solution (2).

Water Not more than 4.0% (Appendix VIII M method 1A), dissolving a quantity equivalent to about 0.2 g of erythromycin in a 10% imidazole solution in anhydrous methanol.

Assay Dissolve an accurately weighed quantity in ethanol to produce a solution of 1000 Units per ml, stand for 2 hours. Dissolve an accurately weighed quantity of Erythromycin RS in ethanol to produce a solution of 1000 Units per ml. Carry out the microbiological assay of antibiotics (Appendix XI A), 1000 erythromycin Units are equivalent to 1 mg of $C_{37}H_{67}NO_{13}$. The fiducial limits is not more than 7%.

Category Macrolide antibiotic.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Erythromycin Stearate Capsules
(2) Erythromycin Stearate Granules
(3) Erythromycin Stearate Tablets

Erythromycin Stearate Capsules

Erythromycin Stearate Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of erythromycin ($C_{37}H_{67}NO_{13}$).

Identification The contents of capsules comply with test (1) and (2) for Identification described under Erythromycin Stearate.

Related substances Carry out the method for Related Substances described under Erythromycin Stearate, using the contents of capsules.

Water Not more than 4.0%, (Appendix VIII M method 1 A) dissolving a quantity of the contents of capsules, equivalent to about 0.2 g of erythromycin, in a 10% imidazole solution in anhydrous methanol.

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with the dissolution medium to produce a solution of 55 µg of erythromycin per ml (solution 1). Dissolve an accurately weighed quantity, equivalent to about the average weight in each capsule of the mixed contents in the test for weight variation of contents, in the dissolution medium and dilute to volume in a 1000 ml volumetric flask. Filter, dilute an accurately measured quantity of the successive filtrate with the dissolution medium to produce a solution of 55 µg of erythromycin per ml (solution 2). Measure the absorbance of the resulting two solutions at 482 nm (Appendix IV A) respectively and calculate the dissolution of $C_{37}H_{67}NO_{13}$ from each capsule. Not less than 75% is dissolved.

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity, equivalent to about 0.1 g of erythromycin of mixed contents obtained from test for weight variation of contents, in ethanol and dilute to produce a solution of 1000 Units per ml, mix well, allow it to stand for 2 hours, measure accurately a quantity of the supernatant and carry out the assay described under Erythromycin Stearate.

Category As described under Erythromycin Stearate.

Strength Calculated as $C_{37}H_{67}NO_{13}$
(1) 0.1 g (100000 Units)
(2) 0.125 g (120000 Units)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Erythromycin Stearate Granules

Erythromycin Stearate Granules contain not less than 90.0% and not more than 110.0% of the labelled amount of erythromycin ($C_{37}H_{67}NO_{13}$).

Description Suspensible granules; odour fragrant; taste, sweet.

Identification (1) To a quantity of the powdered granules equivalent to about 3 mg of erythromycin add 3 ml of acetone, filter, add 2 ml of hydrochloric acid to the filtrate,

an orange yellow colour is produced, which gradually changes to violet red. Add 2 ml of chloroform and shake, the chloroform layer becomes violet.

(2) To 3 g add a quantity of water in a centrifuge tube, shake thoroughly, centrifuge and wash the precipitate with a quantity of water for 3 times. To precipitate add 3.5 ml of dilute hydrochloric acid and 10 ml of water, mix well, gently heat to boil, when oily pearls float on the surface, allow it to cool, to the fatty layer add 3 ml of a 0.4% solution of sodium hydroxide, heat to boil, allow it to cool, a white gel is formed, which forms foams on shaking with 10 ml of boiling water. To 1 ml of the solution add 3-4 drops of calcium chloride TS, a granular precipitate is produced, which is insoluble in hydrochloric acid.

Acidity or alkalinity A suspension of 0.1 mg per ml in water, pH 6.0-9.0 (Appendix VI H).

Loss on drying when dried to constant weight at 105°C, loses not more than 2.0% of its weight (Appendix VIII L).

Other requirements Comply with the general requirements for granules (Appendix I N).

Assay Dissolve an accurately weighed quantity equivalent to about 0.1 g of erythromycin, of mixed contents obtained from test for weight variation of contents or from the test for minimum packing amount, in ethanol and dilute to produce a solution of 1000 Units per ml with sterile water, mix well, allow it to stand for 2 hours, measure accurately a quantity of the supernatant and carry out the Assay described under Erythromycin Stearate.

Category As described under Erythromycin Stearate.

Strength 50 mg (50000 Units), calculated as $C_{37}H_{67}NO_{13}$

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Erythromycin Stearate Tablets

Erythromycin Stearate Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of erythromycin ($C_{37}H_{67}NO_{13}$).

Description Sugar coated or film coated tablets, with white or almost white core.

Identification (1) Comply with test (1) for Identification described under Erythromycin Stearate, using a quantity of powdered tablets.

(2) Triturate a quantity of the powdered tablets with 10 ml of chloroform, filter, evaporate the filtrate to dryness on a water bath, the residue complies with test (2) for Identification described under Erythromycin Stearate.

Related substances To an accurately weighed quantity of powdered tablets add ethanol to produce a solution of 20 mg per ml (calculated as erythromycin), filter, using the filtrate as the solution of the substance being examined, and carry out the procedure for Related Substances described under Erythromycin Stearate, beginning at the words "To an accurately weighed quantity of erythromycin RS...".

Dissolution Carry out the dissolution test (Appendix X C, method 1), using hydrochloric acid solution (9→1000) as the dissolution medium, adjust the rotational speed of the basket to 100 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Dilute a quantity of the successive filtrate with the dissolution medium to produce a solution of 55 µg of erythromycin per ml (solution 1). Weigh accurately and powder 10 tablets, dissolve a quantity

of the powder equivalent to about the average weight in the dissolution medium and dilute to volume in a 1000 ml volumetric flask. Filter, dilute the successive filtrate with the dissolution medium to produce a solution of 55 μg of erythromycin per ml (solution 2). Mix 5 ml of two solutions with 5 ml of sulfuric acid solution (75 \rightarrow 100) respectively. After exactly 45 minutes, measure the absorbance of the resulting two solutions at 482 nm (Appendix IV A) respectively and calculate the dissolution of $\text{C}_{37}\text{H}_{67}\text{NO}_{13}$ from each tablet. Not less than 75% is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weigh accurately and powder 4 tablets. Triturate with ethanol in several portions to dissolve erythromycin stearate and dilute with ethanol to produce a solution of 1000 Units per ml and mix well. Allow it to stand for 2 hours, measure accurately a quantity of the supernatant liquid and carry out the assay described under Erythromycin Stearate.

Category As described under Erythromycin Stearate.

Strength Calculated as $\text{C}_{37}\text{H}_{67}\text{NO}_{13}$
 (1) 0.05 g (50000 Units)
 (2) 0.125 g (125000 Units)
 (3) 0.25 g (250000 Units)

Storage Preserve in tightly closed containers, protected from light and stored in a dry place.

Estazolam

$\text{C}_{16}\text{H}_{11}\text{ClN}_4$ 294.7 [29975-16-4]

Estazolam is 6-phenyl-8-chloro-4H-[1,2,4] triazolo-[4,3- α][1,4] benzodiazepine. It contains not less than 98.5% of $\text{C}_{16}\text{H}_{11}\text{ClN}_4$, calculated on the dried basis.

Description A white or almost white crystalline powder; odourless; taste, slightly bitter. Freely soluble in acetic anhydride or chloroform; soluble in methanol; sparingly soluble in ethyl acetate or ethanol; practically insoluble in water.

Melting point 229-232°C (Appendix VI C).

Specific absorbance Dilute an accurately weighed quantity with hydrochloric acid solution (9 \rightarrow 1000) to produce a solution of 10 μg per ml. Measure the absorbance at 271 nm, the value of A (1%, 1 cm) is 349-367 (Appendix IV A).

Identification (1) To about 10 mg add 15 ml of hydrochloric acid solution (1 \rightarrow 2), boil gently for 15 minutes, cool. The solution yields the reaction characteristic of primary aromatic amines (Appendix III).

(2) Dissolve 1 mg in 1-2 drops of dilute sulfuric acid TS. Examine under ultraviolet light (365 nm), a sky blue fluorescence is produced.

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of estazolam

(Appendix XVI).

Chloride To 1.0 g add 50 ml of water, shake for 10 minutes and filter. Carry out the limit test for chlorides (Appendix VIII A), using 25 ml of the filtrate. Any opalescence produced is not more intense than that of a reference using 7.0 ml of sodium chloride standard solution (0.014%).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (65:35) as the mobile phase. Detection wavelength is at 223 nm, and the number of theoretical plates of the column is not less than 2000, calculated with reference to the peak of estazolam. Dissolve a quantity in mobile phase to produce the solution of the substance being examined containing 0.2 mg per ml as test solution, mix well. Measure accurately a quantity of test solution, dilute with mobile phase as the reference solution containing 2 μg per ml. Inject 20 μl of the reference solution into the column, accurately measured, adjust the attenuation so that the principal peak height in the chromatogram is 20%-25% of the full scale of the chart. Inject separately 20 μl each of the test and reference solutions, both accurately measured, into the column and record the chromatogram for 3 times the retention time of the principal peak. The sum of peak areas other than the principal peak is not greater than 1/2 of area of the principal peak area of the reference solution.

Loss on drying When dried at 105°C to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Assay Dissolve about 0.1 g of the substance in 50 ml of acetic anhydride, add 2 drops of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the colour changes to yellow. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 14.7 mg of $\text{C}_{16}\text{H}_{11}\text{ClN}_4$.

Category Antianxiety agent.

Storage Preserve in tightly closed containers.

Preparation (1) Estazolam Tablets
 (2) Estazolam Injection

Estazolam Injection

Estazolam Injection is a sterile solution of estazolam containing suitable solubilizers. It contains not less than 90.0% and not more than 110.0% of the labelled amount of estazolam ($\text{C}_{16}\text{H}_{11}\text{ClN}_4$).

Description A clear, colourless liquid.

Identification (1) To a quantity equivalent about 1 mg of estazolam add 2 drops of diluted sulfuric acid TS. Examine under ultraviolet light (365 nm), a sky blue fluorescence is produced.

(2) The retention time of principal peak in the substance being examined in the chromatogram obtained in the Assay is identical with that the principal peak in the chromatogram of the reference solution.

pH value 5.6-7.0 (Appendix VI H).

Related substances Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a

Procedure Dissolve about 25 mg of estradiol benzoate CRS, accurately weighed, in methanol in a 25 ml volumetric flask by gentle warming, cool, dilute with methanol to volume, mix well, as the reference solution. Transfer 5 ml each of the reference solution and the internal standard solution, accurately measured, in a 25 ml volumetric flask, dilute with methanol to volume, mix well, inject 10 μ l of the resulting solution into column. Repeat the operation using the substance being examined instead of estradiol benzoate CRS, calculate the content of $C_{25}H_{28}O_3$.

Category Estrogen.

Storage Preserve in tightly closed containers, protected from light.

Preparation Estradiol Benzoate Injection

Estradiol Benzoate Injection

Estradiol Benzoate Injection is a sterile solution of estradiol benzoate in oil. It contains not less than 90.0% and not more than 110.0% of the labelled amount of estradiol benzoate ($C_{25}H_{28}O_3$).

Description A pale yellow clear oily liquid.

Identification Shake a quantity equivalent to about 1 mg of estradiol benzoate with 10 ml of dehydrated ethanol, allow to stand in an ice bath until separated into layers. Centrifuge the upper ethanolic layer, and use the supernatant liquid as the test preparation. Prepare a solution containing 0.1 mg of estradiol benzoate CRS per ml in dehydrated ethanol as the reference preparation. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ether-glacial acetic acid (50 : 30 : 5) as the mobile phase. Apply separately to the plate 10 μ l each of the two solutions. After developing and removal of the plate, dry in air and spray with sulfuric acid-dehydrated ethanol (1:1), heat at 105°C for 10-20 minutes, cool, examine under ultraviolet light (365 nm). The colour and position of the principal spot in the chromatogram obtained with the test preparation corresponds to the principal spot obtained with the reference preparation.

Other requirements Complies with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (80 : 20) as the mobile phase. Detection wavelength is 230 nm and the number of the theoretical plates of the column is not less than 2000.

Procedure Transfer a quantity, measured accurately, equivalent to about 2 mg of estradiol benzoate, to a 100 ml volumetric flask, add a quantity of absolute ethanol and shake thoroughly. After the solution is clear, dilute with absolute ethanol to volume and mix well. Inject 20 μ l into the column and record the chromatogram. Dissolve a quantity of estradiol benzoate CRS, accurately weighed, in absolute ethanol and dilute to produce a solution of 20 μ g per ml. Repeat the operation using the resulting solution. Calculate the content of $C_{25}H_{28}O_3$ with respect to the peak area obtained in the chromatogram by the external standard method.

Category As described under Estradiol Benzoate.

Strength (1) 1 ml:1 mg (2) 1 ml:2 mg

Storage Preserve in well closed containers, protected from light.

Estradiol Sustained-release Patches

Estradiol Sustained-release Patches contain not less than 85.0% and not more than 115.0% of the labelled amount of estradiol ($C_{18}H_{24}O_2$).

Description The patches consist of an outer covering which supports a preparation which contains the active substance and adhesive matrix. The patches are covered by a protective liner, which is transparent or creamy coloured.

Identification (1) To one patch with protective liner removed, add a quantity of acetone, shake to dissolve estradiol. Evaporate on a water bath to remove acetone, dissolve the residue in 2 ml of sulfuric acid, a yellowish-green fluorescence is produced; add 3 drops of ferric chloride TS, the colour changes to green, then changes to red on diluting with water.

(2) To one patch with protective liner removed, add 10 ml of methanol, shake to dissolve estradiol, use the supernatant liquid as the test solution. Prepare a reference solution of 0.25 mg of estradiol CRS per ml in methanol. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of toluene-acetone (4:1) as the mobile phase. Apply separately to the plate 20 μ l each of above two solutions. After developing and removal of the plate, dry it in air, spray with sulfuric acid-ethanol (1:1), heat at 105°C for 5 minutes. The colour and position of the principal spot in the chromatogram obtained with the test solution correspond to the principal spot obtained with the reference solution.

(3) The retention time of the principal peak of the test solution is identical with that of the reference solution in the Assay.

Content uniformity Comply with the requirements for Content uniformity (Appendix X E). Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (75:25) as the mobile phase. Detection wavelength is 280 nm and the number of theoretical plate of the column is not less than 2000, calculated with reference to the peak of estradiol. Transfer one patch with protective liner removed in a 100 ml volumetric flask, soak the patch in 5 ml of ethyl acetate for 30 minutes, place the volumetric flask in an ultrasonic bath for 15 minutes to dissolve estradiol, cool to room temperature, dilute with methanol to volume, mix well and filter, using the successive filtrate as the test solution. Dissolve an accurately weighed quantity of estradiol CRS in methanol to produce a reference solution of about 25 μ g per ml. Inject 20 μ l each of the resulting solutions separately into the column and record the chromatogram. Calculate the content of $C_{18}H_{24}O_2$ with respect to the peak area obtained in the chromatogram by the external standard method. The limit is $\pm 20\%$.

Drug Release Carry out the method for drug release test (Appendix X D, method 3), using 1000 ml of 1% polyglycol 400 solution as the dissolution medium and adjust the rotational speed of the paddle to 30 rpm. Withdraw the whole solution at exact 24,72,120 and 168 hours respectively, filter and supply 1000 ml of the dissolution medium accordingly in the vessel immediately, use the successive filtrate as test solutions. Transfer about 12.5 mg

of estradiol CRS, accurately weighed, in a 100 ml volumetric flask, add a quantity of methanol to dissolve estradiol, and dilute it with methanol to volume. Measure accurately a quantity of the resulting solution, dilute with the dissolution medium to produce a reference solution of about 0.5 μg per ml. Carry out the method for high performance liquid chromatography as described under Content uniformity. Calculate the content of $\text{C}_{18}\text{H}_{24}\text{O}_2$ dissolved from each patch at 24, 72, 120 and 168 hours separately. The dissolution of estradiol complies with the requirement; the quantity dissolved of each patch is not less than 20%-50%, 40%-70%, 60%-80% and over 70% of the labelled amount of $\text{C}_{18}\text{H}_{24}\text{O}_2$ at 24, 72, 120 and 168 hours respectively.

Test for heat resistance Heat 2 patches with protective liner removed at 120°C for 30 minutes, allow to cool; the back of the out covering does not change to yellow, and the release surface maintain adhesion by touching with fingers.

Other requirements Comply with the general requirements for patches (Appendix I V).

Assay Calculate the average of 10 patches results obtained under the test for Content uniformity.

Category As described under Estradiol.

Strength 2.5 mg (4.0 cm × 2.6 cm)

Storage Preserve in tightly closed containers, stored in a cool place.

Estradiol Valerate

$\text{C}_{23}\text{H}_{32}\text{O}_3$ 356.51

[979-32-8]

Estradiol Valerate is estro 1,3,5 (10)-triene-3,17 β -diol-17-pentanoate. It contains not less than 96.0% and not more than 103.0% of $\text{C}_{23}\text{H}_{32}\text{O}_3$, calculated on the dried basis.

Description A white crystalline powder; odourless. Freely soluble in ethanol, acetone or chloroform; slightly soluble in vegetable oil; practically insoluble in water.

Melting range 145-150°C (Appendix VI C).

Specific optical rotation +41° to +47° measured at 25°C, in a solution of 10 mg per ml in dioxane (Appendix VI E).

Identification (1) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in the Assay.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of estradiol valerate (Appendix XVI).

Related substances Carry out the method as described under Assay. Dissolve a quantity of the substance being examined in methanol to produce a solution (1) of about 4 mg per ml. Measure accurately 2 ml of solution (1) into a 100 ml volumetric flask and dilute with methanol to volume, shake well as solution (2). Inject 10 μl of solution (2) into the column. Adjust the attenuation so that the principal peak

height in the chromatogram is about full scale of the chart. Then inject separately 10 μl of solution (1) and (2) into the column, and record the chromatogram for twice of the retention time of the principal peak. If there are any other peaks except the principal peaks in the chromatogram of solution (1), the area of any one is not greater than 1/2 of the area of the principal peak of solution (2), the sum of the areas of all peaks other than the principal peak is not greater than 3/4 of the area of the principal peak of solution (2).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85:15) as the mobile phase. Detection wavelength is 218 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to estradiol valerate. The resolution factor between the peaks of estradiol valerate and internal standard complies with the related requirements.

Internal standard solution Dissolve a quantity of megestrol acetate, accurately weighed, in methanol to produce a solution of about 0.4 mg per ml.

Procedure Dissolve a quantity of estradiol valerate CRS, accurately weighed, in methanol to produce a solution of about 8 mg per ml as reference solution. Transfer 2 ml each of the reference solution and the internal standard solution, both accurately measured, in a 10 ml volumetric flask, dilute with methanol to volume, mix well, inject 5 μl of the resulting solution into the column. Repeat the operation, using the substance being examined instead of estradiol valerate CRS, calculate the content of $\text{C}_{23}\text{H}_{32}\text{O}_3$.

Category Estrogen.

Storage Preserve in tightly closed containers, protected from light.

Preparation Estradiol Valerate Injection

Estradiol Valerate Injection

Estradiol Valerate Injection is a sterile solution of estradiol valerate in oil. It contains not less than 90.0% and not more than 110.0% of the labelled amount of estradiol valerate ($\text{C}_{23}\text{H}_{32}\text{O}_3$).

Description A pale yellow clear oily liquid.

Identification (1) Shake a quantity equivalent to about 5 mg of estradiol valerate with 2.5 ml of methanol for 10 minutes and centrifuge, use the methanol solution as the test solution. Dissolve a quantity of estradiol valerate CRS with methanol to produce a solution of 2 mg per ml. Carry out the method for thin-layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of benzene-ether-glacial acetic acid (50:30:0.5) as the mobile phase. Apply separately to the plate 5 μl each of the two solutions mentioned above. After developing and removal of the plate, dry in air and then at 105°C for 10 minutes, cool and spray with sulfuric acid-dehydrated ethanol (1:1), heat at 105°C for 10 minutes, cool and examine immediately. The position of the principal spot in the chromatogram obtained with the test solution is identical with that of the principal spot obtained with the reference solution.

(2) The retention time of principal peak of the substance being examined is identical with that of principal peak of the reference solution in the chromatogram obtained in the

Assay.

(1) or (2) may be used alternatively.

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay Carry out the method for high performance liquid chromatography (Appendix V D), using a column packed with octadecylsilane bonded silica gel and a mixture of methanol-water (85 : 15) as mobile phase. Detection wavelength is 281 nm and the number of the theoretical plates of the column is not less than 3000, calculated with reference to the peaks of estradiol valerate. The resolution factor between the peaks of estradiol valerate and internal standard complies with the related requirements.

Internal Standard Solution Dissolve a quantity of testosterone propionate in methanol to produce a solution of about 5 mg per ml.

Procedure Transfer an accurately measured quantity of the injection equivalent to about 10 mg of estradiol valerate to a stoppered centrifugal tube with a "to contain" pipet, wash the interior of the pipet with several portions of ether, combine the washings to the same tube, evaporate the ether on a warm water bath. Extract the injection with 5, 5, 5, 3 ml of methanol, respectively, in each extraction shake 10 minutes and centrifuge. Transfer the methanol solutions to a 25 ml volumetric flask with a dropper, combine the methanolic extracts, add 5 ml of internal standard solution and dilute with methanol to volume, mix well, as the test solution, inject 20 μ l into the column. Dissolve an accurately weighed quantity of estradiol valerate CRS in methanol to produce a solution of 2 mg per ml. Measure accurately, 5 ml each of the solution and the internal standard solution in a 25 ml volumetric flask, dilute with methanol to volume, mix well, as the reference solution, inject the reference solution into the column in the same manner, calculate the content of $C_{23}H_{32}O_3$.

Category As described under Estradiol Valerate.

Strength (1) 1 ml:5 mg (2) 1 ml:10 mg

Storage Preserve in well closed containers, protected from light.

Etacrynic Acid

$C_{13}H_{12}Cl_2O_4$ 303.14

[58-54-8]

Etacrynic Acid is [4-(2-methylene-1-oxobutyl) phenoxy-2,3-dichloro] acetic acid. It contains not less than 98.0% of $C_{13}H_{12}Cl_2O_4$, calculated on the dried basis.

Description A white crystalline powder; odourless; taste, slightly bitter and astringent.

Freely soluble in ethanol or ether; practically insoluble in water; freely soluble in glacial acetic acid.

Melting range 121-125°C (Appendix VI C).

Identification (1) Heat about 30 mg with 2 ml of sodium hydroxide TS in a water bath for 5 minutes, cool, add 0.25 ml of sulfuric acid solution (1 \rightarrow 2) and 0.5 ml of 10% sodium chromotopate solution, then add 2 ml of sulfuric

acid cautiously; a deep violet colour is produced.

(2) The light absorption of a solution of 50 μ g per ml in hydrochloric acid-methanol (1:1000) exhibits a maximum at 270 nm; the absorbance is about 0.58 (Appendix IV A).

(3) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of etacrynic acid (Appendix XVI).

(4) Mix about 20 mg with 0.10 g of anhydrous sodium carbonate and ignite, cool; dissolve the residue in 10 ml of water with heating and filter. The filtrate yields the reaction characteristic of chlorides (Appendix III).

Benzene extractive Dissolve 1.0 g in 50 ml of 8% sodium sulfite solution with shaking. Allow to stand for 20 minutes, add 5 ml of hydrochloric acid and mix well. Extract with three portions of 15 ml of benzene, shaking for 2 minutes each time. Transfer the benzene layer to a centrifuge tube and centrifuge if necessary. Then transfer the combined benzene extracts to a tared evaporating dish, evaporate on a water bath to dryness and dry the residue at 60°C under reduced pressure for 2 hours. The residue weighs not more than 20 mg.

Loss on drying When dried in vacuum over phosphorous pentoxide to constant weight, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.002%.

Assay Dissolve about 0.15 g, accurately weighed, in 40 ml of glacial acetic acid in an iodine flask. Add accurately 25 ml of bromine (0.05 mol/L) VS and 3 ml of hydrochloric acid, immediately stopper the flask, mix well and allow to stand in dark for 1 hour. Add 10 ml of potassium iodide TS, immediately stopper the flask, mix well, add 100 ml of water. Titrate with sodium thiosulfate (0.1 mol/L) VS, add 2 ml of starch IS towards the end-point, continue the titration until the blue colour disappears. Perform a blank determination and make any necessary correction. Each ml of bromine (0.05 mol/L) VS is equivalent to 15.16 mg of $C_{13}H_{12}Cl_2O_4$.

Category Diuretic.

Storage Preserve in tightly closed containers, protected from light.

Preparation Etacrynic Acid Tablets

Etacrynic Acid Tablets

Etacrynic Acid Tablets contain not less than 90.0% and not more than 110.0% of the labelled amount of etacrynic acid ($C_{13}H_{12}Cl_2O_4$).

Description White tablets.

Identification Mix a quantity of the powdered tablets equivalent to about 0.1 g of etacrynic acid with 10 ml of ethanol, stir to dissolve etacrynic acid, filter, evaporate the filtrate to dryness on a water bath. The residue complies with (1), (2) and (4) tests for Identification described under Etacrynic Acid.

Dissolution Carry out dissolution test (Appendix X C, method 2) using 900 ml of phosphate buffer solution (to 13.6 g of potassium dihydrogen phosphate add 95 ml of 0.1 mol/L sodium hydroxide solution, and adjust to pH 8.0

with 0.1 mol/L sodium hydroxide solution and dilute with water to 1000 ml) as the dissolution medium, adjust the rotational speed of the paddle to 50 rpm. Withdraw a quantity of the solution after exactly 45 minutes and filter. Measure the absorbance of the successive filtrate at 277 nm (Appendix IV A). Dissolve a quantity of etacrynic acid CRS, accurately weighed, in above dissolution medium and dilute to produce a solution of 30 µg per ml. Measure the absorbance in the same manner. Calculate the dissolution of $C_{13}H_{12}Cl_2O_4$ from each tablet. Not less than 75% of the labelled amount is dissolved.

Other requirements Comply with the general requirements for tablets (Appendix I A).

Assay Weight accurately and powder 20 tablets. Transfer an accurately weighed quantity of the powdered tablets equivalent to about 0.15 g of etacrynic acid to a separator, add 25 ml of 0.1 mol/L hydrochloric acid solution and shake thoroughly. Extract with three portions of 50 ml each of dichloromethane, filter the combined extracts into a 250 ml iodine flask, evaporated to dryness on a water bath. Carry out the Assay described under Etacrynic Acid, beginning at the words "dissolve in 40 ml of glacial acetic acid". Each ml of bromine (0.1 mol/L) VS is equivalent to 15.16 mg of $C_{13}H_{12}Cl_2O_4$.

Category As described under Etacrynic Acid.

Strength 25 mg

Storage Preserve in tightly closed containers, protected from light.

Ethacridine Lactate

$C_{15}H_{15}N_3O \cdot C_3H_6O_3 \cdot H_2O$ 361.40 [1837-57-6]

Ethacridine lactate is α -ethoxyacridine-6,9-diamino lactate monohydrate. It contains not less than 99.0% of $C_{15}H_{15}N_3O \cdot C_3H_6O_3$, calculated on the dried basis.

Description A yellow crystalline powder; odourless; taste, bitter. Freely soluble in hot water; soluble in boiling dehydrated ethanol; sparingly soluble in water; slightly soluble in ethanol; insoluble in ether.

Identification (1) Dissolve about 0.1 g in 10 ml of water, add sodium hydroxide TS to make alkaline, a yellow precipitate is produced. Filter, add 2 ml of sulfuric acid solution (0.5 mol/L) and a few drops of potassium permanganate TS, a purple colour is produced which disappears on heating.

(2) Dissolve 50 mg in 5 ml of water, acidify with dilute hydrochloric acid, add 1 ml of sodium nitrite TS, a cherry red colour is produced.

(3) To the aqueous solution (1→2000) add a few drops of iodine TS, a deep bluish-green precipitate is produced which disappears on addition of ethanol.

(4) The aqueous solution (1→40000) exhibits yellowish green fluorescence at the transmission light.

Acidity Dissolve 0.1 g in 100 ml of water, pH 6.0-7.0 (Appendix VI H).

Clarity and colour of solution A solution of 0.20 g in 10 ml of freshly boiled and cooled to 50°C water is clear. Any colour produced by 5 ml of this solution diluted to 10 ml with water is not more intense than that of reference solution (9.5 ml of 1% trinitrophenol solution, add 0.22 ml of ferric chloride CS (Appendix XVI B) and 0.28 ml of water, mix well).

Chloride Dissolve 1 g in 80 ml of water by heating on water bath and cool. Add 10 ml of sodium hydroxide TS, dilute with water to 100 ml, shake and mix well. Allow to stand for 30 minutes and filter. Measure 20 ml of successive filtrate, add 7 ml of dilute nitric acid and 1 ml of silver nitrate TS, dilute with water to 50 ml. Carry out the limit test for chloride (Appendix VIII A). Any opalescence produced is not more pronounced than that of a reference solution using 5 ml of sodium chloride standard solution (0.025%).

Sulfate To 20 ml of above filtrate, add 4.5 ml of water and 1.5 ml of dilute hydrochloric acid. Carry out the limit test for sulfate (Appendix VIII B). Any opalescence produced is not more pronounced than that of a reference solution using 10 ml of potassium sulfate standard solution (0.5%).

Loss on drying When dried to constant weight at 105°C, loses not more than 5.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N); use 1.0 g.

Heavy metals Carry out the limit test for heavy metals (Appendix VIII H, method 2), using the residue obtained in the test for Residue on ignition; not more than 0.003%.

Assay To about 0.3 g accurately weighed, in a 100 ml volumetric flask, add 25 ml of water, 20 ml of sodium acetate TS and 1.25 ml of dilute hydrochloric acid, then add accurately 50 ml of potassium dichromate (0.01667 mol/L) V in water to volume. Allow to stand for 1 hour with frequently shaking and filter. Measure accurately 50 ml of the successive filtrate in a conical flask with stopper, add 30 ml of dilute sulfuric acid and 6 ml of potassium iodide TS, stopper the flask immediately, mix well and allow to stand in dark place for 5 minutes. Add 50 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end of titration. Add 3 ml of starch IS, continue to titrate until blue colour disappears and a bright green colour is produced. Perform a blank determination and make any necessary correction. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 11.45 mg $C_{15}H_{15}N_3O \cdot C_3H_6O_3$.

Category Antiseptics-Disinfectant.

Storage Preserve in tightly closed containers.

Preparation (1) Ethacridine Lactate Injection
(2) Ethacridine Lactate Solution

Ethacridine Lactate Injection

Ethacridine Lactate Injection is a sterile solution of Ethacridine Lactate in water for injection. It contains not less than 93.0% and not more than 107.0% of the labelled amount of Ethacridine Lactate ($C_{15}H_{15}N_3O \cdot C_3H_6O_3$).

Description A clear, yellow liquid.

Identification (1) To 2 ml of the test solution, acidify with dilute hydrochloric acid, add 1 ml of sodium nitrite TS, a cherry red colour is produced.

(2) To 4 ml of the test solution, add sodium hydroxide TS

to make alkaline, a yellow precipitate is produced. Filter, add 2 ml of sulfuric acid solution (3→100) and a few drops of potassium permanganate TS, a purple colour is produced which disappears on heating.

(3) The light absorption of a solution of 5 µg per ml in water exhibits maxima at 206 nm, 260 nm and 362 nm (Appendix IV A).

pH value 5.5-7.5 (Appendix VI H).

Colour of solution Any colour produced by 4 ml of the test solution diluted to 10 ml with water is not more intense than that of the reference solution (9.5 ml of 1% trinitrophenol solution, add 0.22 ml of ferric chloride CS and 0.28 ml of water, mix well).

Other requirements Comply with the general requirements for injections (Appendix I B).

Assay To 10 ml of the injection, accurately measured, in a 100 ml volumetric flask, add 25 ml of water, 20 ml of sodium acetate TS and 1.25 ml of dilute hydrochloric acid, then add accurately 50 ml of potassium dichromate (0.0167 mol/L) VS and water to volume. Allow to stand for 1 hour with frequently shaking, filter, discards 20 ml of the initial filtrate. Measure accurately 50 ml of the successive filtrate in a conical flask with stopper, add 30 ml of dilute sulfuric acid and 6 ml of potassium iodide TS, stopper the flask immediately, mix well and allow to stand in dark place for 5 minutes. Add 50 ml of water, titrate with sodium thiosulfate (0.1 mol/L) VS towards the end of titration. Add 3 ml of starch IS, continue to titrate until blue colour disappears and a bright green colour is produced. Perform a blank determination and make any necessary correction. Each ml of potassium dichromate (0.01667 mol/L) VS is equivalent to 11.45 mg of $C_{15}H_{15}N_3O \cdot C_3H_6O_3$.

Category As described under Ethacridine Lactate.

Strength 2 ml:50 mg

Storage Preserve in well closed container, protected from light.

Ethacridine Lactate Solution

Ethacridine Lactate Solution is a solution of ethacridine lactate in water. It contains not less than 93.0% and not more than 107.0% of the labelled amount of ethacridine lactate ($C_{15}H_{15}N_3O \cdot C_3H_6O_3$).

Description A clear yellow liquid.

Identification (1) Acidify about 10 ml with dilute hydrochloric acid, add 1 ml of sodium nitrite TS, a cherry-red colour is produced.

(2) Alkalize about 10 ml with sodium hydroxide TS, a yellow precipitate is formed and filter. Add 2 ml of sulfuric acid solution (3→100) and a few drops of potassium permanganate TS to the filtrate, a violet-red colour is produced and disappears on heating.

pH value 5.0-7.5 (Appendix VI H).

Minimum Fill Complies with the test for Minimum Fill (Appendix X F).

Assay Measure accurately 50 ml into a 100 ml volumetric flask, add 15 ml of water, 20 ml of sodium acetate TS and 1.25 ml of dilute hydrochloric acid, add accurately 10 ml of potassium dichromate (0.01667 mol/L) VS, dilute with water to volume, shake thoroughly, allow to stand for an hour, shake frequently and filter. Measure accurately 50 ml

of successive filtrate into an iodine flask, add 30 ml of dilute sulfuric acid and 6 ml of potassium iodide TS, stopper immediately and mix well. Allow to stand in a dark place for 5 minutes. Add 50 ml of water and titrate with sodium thiosulfate (0.025 mol/L) VS until the end point is nearly reached, add 3 ml of starch IS and continue to titrate until the colour turns from blue to brilliant green. Perform a blank determination and make any necessary correction. Each ml of sodium thiosulfate (0.025 mol/L) VS is equivalent to 11.45 mg of $C_{15}H_{15}N_3O \cdot C_3H_6O_3$.

Category As described under Ethacridine Lactate.

Strength 0.1%

Storage Preserve in tightly closed containers, protected from light.

Ethambutol Hydrochloride

$C_{10}H_{24}N_2O_2 \cdot 2HCl$ 277.23

[1070-11-7]

Ethambutol Hydrochloride is (+) 2,2'-(ethylene-diimino)-di-1-butanol dihydrochloride. It contains not less than 98.5% of $C_{10}H_{24}N_2O_2 \cdot 2HCl$, calculated on the dried basis.

Description A white, crystalline powder; odourless or almost odourless; slightly hygroscopic.

Very soluble in water; sparingly soluble in ethanol; very slightly soluble in chloroform; practically insoluble in ether.

Melting range 199-204°C, with decomposition (Appendix VI C).

Specific optical rotation +6.0° to +7.0°, in a solution of about 0.10 g per ml in water, measured at 25°C (Appendix VI E).

Identification (1) Dissolve about 20 mg in 2 ml of water, add 2-3 drops of cupric sulfate TS, mix well, then add 2-3 drops of sodium hydroxide TS, a deep blue colour is produced.

(2) The infrared absorption spectrum (Appendix IV C) is concordant with the reference spectrum of ethambutol hydrochloride (Appendix XVI).

(3) The aqueous solution yields the reactions characteristic of chlorides (Appendix III).

(+) 2-Aminobutanol Carry out the method for thin layer chromatography (Appendix V B), using silica gel G as the coating substance and a mixture of ethyl acetate-glacial acetic acid-hydrochloric acid-water (11:7:1:1) as the mobile phase. Apply separately to the plate 5 µl each of two solutions in methanol containing (1) 20 mg per ml of the substance being examined, (2) 0.20 mg per ml of (+) 2-aminobutanol CRS. After developing and removal of the plate, dry in air and then at 105°C for 30 minutes. Allow to cool and spray with ninhydrin TS, dry again at 105°C for 30 minutes. Any spot other than the principal spot in the chromatogram obtained with solution (1) is not more intense than that of the principal spot obtained with solution (2) (1.0%).

Loss on drying When dried to constant weight at 105°C, loses not more than 0.5% of its weight (Appendix VIII L).

Residue on ignition Not more than 0.1% (Appendix VIII N).

Heavy metals Dissolve 1.0 g in 2 ml of acetate BS (pH 3.5) and sufficient water to produce 25 ml, carry out the limit test for heavy metals (Appendix VIII H, method 1); not more than 0.001%.

Assay Dissolve about 0.1 g, accurately weighed, in 20 ml of glacial acetic acid, add 5 ml of mercury acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 13.86 mg of $C_{10}H_{24}N_2O_2 \cdot 2HCl$.

Category Tuberculostatic agent.

Storage Preserve in tightly closed containers, protected from light.

Preparation (1) Ethambutol Hydrochloride Tablets
(2) Ethambutol Hydrochloride Capsules

Ethambutol Hydrochloride Capsules

Ethambutol Hydrochloride Capsules contain not less than 90.0% and not more than 110.0% of the labelled amount of ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$).

Description Capsules containing white crystalline powder.

Identification (1) Dissolve about 20 mg of contents of the capsules in 2 ml of water, add 2-3 drops of cupric sulfate TS, mix well, then add 2-3 drops of sodium hydroxide TS, a deep blue colour is produced.

(2) The aqueous solution of contents of the capsules yields the reactions characteristic of chlorides (Appendix III).

Other requirements Comply with the general requirements for capsules (Appendix I E).

Assay Dissolve an accurately weighed quantity of the mixed contents obtained in the test for weight variation for contents equivalent to about 0.1 g of ethambutol hydrochloride in 20 ml of glacial acetic acid, add 5 ml of mercury acetate TS and 1 drop of crystal violet IS. Titrate with perchloric acid (0.1 mol/L) VS until the solution becomes bluish-green. Perform a blank determination and make any necessary correction. Each ml of perchloric acid (0.1 mol/L) VS is equivalent to 13.86 mg of $C_{10}H_{24}N_2O_2 \cdot 2HCl$.

Category As described under Ethambutol Hydrochloride.

Strength 0.25 g

Storage Preserve in tightly closed containers, stored in a dry place and protected from light.

Ethambutol Hydrochloride Tablets

Ethambutol Hydrochloride Tablets contain not less than 93.0% and not more than 107.0% of the labelled amount of ethambutol hydrochloride ($C_{10}H_{24}N_2O_2 \cdot 2HCl$).

Description White or film coated tablets with white core.

Identification To a quantity of the powdered tablets equivalent to about 0.1 g of ethambutol hydrochloride add 10 ml of water, shake to dissolve ethambutol hydrochloride and

filter. The filtrate complies with tests (1) and (3) for Identification described under Ethambutol Hydrochloride.
